CALIFORNIA NEEDS ALFALFA

California is one of the best alfalfa states in the Union, and yet today it needs alfalfa perhaps more than any other state. Our grain hay crop will doubtless be lighter than usual because of the lateness of the rains. With high prices facing us this coming summer and fall no more profitable crop than alfalfa could be planted by those who have the available land and water. Without an adequate supply of hay the dairying business will suffer. A large alfalfa acreage is one of the best assets of a community. Whole tons have been built on alfalfa. Authorities predict that it may be years before the price of alfalfa returns to anywhere near its former levels.

## Speed up with Electric Power

*"Production and Not Acreage is the Measure of Profit"*

**H**ERE are some of the ways in which modern industry has been speeded up by putting electric power to work in the right place.

Metal mines have boosted output to meet world-wide demands. Great central power plants in place of small local plants in coal mining areas now supply cheaper electric power per ton output for each mine. All tonnage records have been smashed in the steel industry. Greater automobile output has lowered prices and given better road transportation.

More and better cloth has been produced at lower power costs.

Through the use of electric motors many farmers are also securing the high production obtained in the big manufacturing industries.

Over 200,000 H.P. in G-E motors is now at work in this way on the Pacific coast.

2500 G-E Motor Agents throughout the country are ready to help you reap the benefits of doing your work the electrical way.

## Keep a Chicken

Written for California Cultivator by Jean A. Koethen

**I**F EVERY hen laid an egg every day, one chicken in the back yard might help out the family living considerably, but unfortunately hens, like goats, are not constant producers. Allowance must be made for resting and molting and broodiness and contrariness, and bad weather. One authority says two hens for each member of the family is about right. This would be eight hens for a family of four, and this is plenty. Indeed, six good layers will furnish all the eggs a family of four needs. If one enjoys the care of hens, and doesn't mind hurrying home in the late afternoon to feed them, twelve hens will be better than eight or six. They will lay eggs for a large family and require but little more room than the smaller flock.

The mistake many backlotterers make is in thinking that if 12 hens are profitable 20 will be more profitable. As soon as you go above a dozen the feed bills begin to mount up, while the price received for market eggs does not keep pace. It is not easy on a single town lot to raise green feed for more than a dozen hens, and green feed is a tremendously important item. Then the house must be larger, the run bigger, or there will be crowding, and a whole train of disastrous results.

But number is not the chief item in the backlot flock. We want not merely hens, but good hens. At least we ought to want them. I am not at all sure that the average backlotter, in spite of all the educational work done by poultry shows, really wants good hens. Most backlotterers care vastly more about the cost of a hen than they do about her looks or breeding. Eggs at a dollar a setting and laying hens at a dollar apiece are their ideal, and it is very hard to make them understand that it isn't possible to raise a hen to laying age for a dollar or to produce good hatching eggs for that price. It is something, however, that the general public has reached the point where it is willing and even anxious to keep hens. A love for good poultry will surely develop in time. When one has once kept standard bred hens he will never keep anything else.

The best place for the backlot chicken house is in the highest corner of the backyard. Moisture should drain away from it instead of into it. Let it front south or east, according to convenience, so that it may catch at least the morning sun. Don't put the house against a high fence if you can help it. In the exceptional hot spell of summer it is the free current of air that saves the hens. If you cannot get away from the fence have a gate that can be opened when necessary. For 12 hens a house six feet square gives ample room if the whole floor is allowed for scratching. A portable coop 6x4 will answer in most seasons. This may be built of 1x2 and covered with tarred paper or with a shingle roof and burlap sides. The objection to such a coop is that it does not give the protection hens need in rainy weather. They must either sit on the roosts or wander about in the rain. It would be a good plan to have a coop of this sort for summer use so that the hens may be moved while their house is cleaned and disinfected and their yard purified by a crop of greens.

For the backyard poultry house two yards are almost a necessity. One may be built behind the house, the other in front, or they may be at each side.

The size of the yard does not so much matter as the possibility of removing the hens from it and utilizing the rich soil for vegetables or greens. Such a plan does away with the necessity for constantly spading and digging and carrying out manure and makes a good garden possible with the smallest outlay of time and strength. A good way of arranging a double yard of this sort would be to fence off the rear 40 feet of the lot, dividing it lengthwise into two yards each 20x50 feet. Place the house at the upper end of the partition fence with a door into each yard. While the hens run in one yard a splendid garden may be grown in the other. Plant fruit trees from 15 to 20 feet apart in the yards, and you have a combination of chickens, garden and fruit which is hard to beat. If you wish to raise chicks, an additional yard will be needed. This may be taken off the end of one of the larger yards or put in a corner by itself. If you have a garage or feed house or shop, try to arrange the yard for the young chicks against the east side of this building. They will then be readily protected from the wind and can be moved into the house in extremely wet weather.

Which breed is best for the backlot hennery is still a matter of argument. The truth is that all breeds are good. Leghorns are not as popular for the backlot as the heavier breeds because they are less easily controlled and not as good for the table, but this is a matter of taste. I find the Rhode Island Red is a more general favorite in my neighborhood than any other breed, but this I am satisfied is because few persons realize the great value of the Orpington as a dual purpose fowl. The Barred Rock is not as popular West or East, and the same may be said of the Wyandotte. The point is to find a breed you like; don't be satisfied with what your neighbors think. Then get the best stock you can find of that breed, remembering always that eggs are the real test of a hen's worth. Get fine feathers if you can, but be sure of eggs first.

Many authorities are predicting a boom for the poultry industry, with higher prices than ever before, etc. Let us not be misled by these glowing predictions. Undoubtedly prices will be higher. They are higher now and will remain so. But there seems no reasonable prospect of any great drop in the price of feed. The backlotter will do well if he keeps his mind off the idea of his hens as a commercial asset and thinks of them rather as a great help in the economical running of his household. Not only will they provide the best of food at a reasonable price, but they utilize the waste from kitchen and garden and furnish manure for the growing of more garden. When all these items are considered there is no question that backlot hens pay and pay well. More important still is the fact that every person who produces a dozen eggs or a "springer" is doing just that much toward feeding the world. Whether or not the eggs and the "springer" cost him all they are worth is beside the question. The great thing today is not money but food, food at any cost.

**BUTTERMILK ADDED**

**THE U. S. GOVERNMENT AGRICULTURAL EXPERTS** have proven that buttermilk prevents and cures White Diarrhea and is of great importance in poultry feeding.

Send to U. S. Agricultural Dept. Station, Berkeley, Cal., for Bulletin 182 (free) explaining the value of buttermilk to poultry.

Globe A-1 Buttermilk Mash is a food poultry like and eat in preference to grain.

Costs no more than ordinary mash, but it's worth more because of the **DRY BUTTERMILK** added.

Sample and valuable feeding information free.

**GLOBE MILLS, Los Angeles**

**BUTTER GLOBE MILK DRY A-1 MASH**

# Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

## Loss in Raising Chicks

What would be the normal per cent of loss on 1000 baby chicks, purchased in February, until they were four months old? How many chicks do the large poultry plants figure on raising out of that number? — Subscriber, Vista.

This question was submitted to J. M. Davison, president of the Poultry Producers' Association. Mr. Davison replied that the large poultryman who raises thousands of chicks every year expects a loss of about 20 per cent. The number of chicks raised to four months of age varies from year to year, some years being as high as 95 per cent, and others falling considerably below 80 per cent, but the poultryman figures that he is doing about as well as can be expected if he raises 800 chicks out of 1000.—J. A. K.

## Eucalyptus from Cuttings

Is there any record of eucalyptus having been propagated by cuttings? If so, when, by whom, and what varieties?—Subscriber, Lakeside.

The propagation of eucalyptus is so very easy with seed that we do not think its propagation by use of cuttings has ever been followed other than for occasional trees. We have seen Eucalyptus globulus growing from cutting accidentally made and plowed under. Have our subscribers information along that line?

## Protecting Trees from Sun

I had some almond trees set out last spring and the cutworms and ants ate the buds. I put tanglefoot around the trees, but I thought it might girdle them so this spring I cut through it several times with a knife as they spread. Will they need protection from the sun?—Subscriber, Chico.

That would depend upon the condition of the tree somewhat. If strong and lusty growing presumably no harm would come, especially if trees have been headed low and are thereby more or less protected by leaf growth. However, it is a very simple matter to protect either with burlap or even old newspapers.

## Rust on Snapdragons

Am sending small branch of snapdragon covered with some kind of fungus growth. I never had anything like it before, but a neighbor had it on her plants last year and it killed them, so I would like to know what to do for it. So far it is only on the old plants and I want to kill it out before it gets on the young ones.—Subscriber, San Rafael.

Prof. J. T. Barrett of the state university answers: "The fungus submitted is a rust, one of the Puccinias, which is very common upon snapdragon, sometimes entirely destroying the plants. Like most rusts, it is not easy to control. However, it may be reduced if the plants are sprayed when the first indication of the rust appears, with a weak Bordeaux mixture. Some growers object to the use of the Bordeaux because it discolors the foliage of the plants. I am inclined to believe that if the plants were sprayed even before blooming began that this would materially check the development of the fungus."

## Applying Lime

I have ordered two cars of ground limestone and wish to ask you what is the best way to apply it. I have a heavy cover crop on ground now which I am to plow under and wish to

know whether it would be best to put it on top of cover crop and plow under or wait until I get plowed and then apply and work in or wait until fall.—Subscriber, Puente.

Apply before plowing. Perhaps the most economical method and also the most satisfactory is to use ordinary manure spreader to make this application. Usually one to two tons per acre is applied according to conditions of soil.

## Watering Hogs

How can a sanitary drinking trough for hogs be made?—Subscriber, Norwalk.

Here is a suggestion from the book called "Swine in America," by Coburn, and published by Orange Judd Co.

"I have a galvanized sheet iron pan two feet square and six inches deep, flaring a little at the top. Take a tight oil barrel and with a 5-8 inch bit bore two holes in the side so that when

the barrel is placed in the pan the holes will be one inch below the pan's top. Bore a two inch hole in the top of the barrel. Place the barrel in the pan, cork tightly the two holes at the

## POWER FOR EVERY NEED

Horses, mules and labor are scarce, yet the call for top-notch production makes the need for power greater now than ever before. Tractors, tractor implements and other power-farming equipment fill the need. To see and study this equipment and to learn of the profits and possibilities in tractor-farming is a patriotic duty and a profit-making opportunity for every farmer. This opportunity is offered by the

## Tractor and Implement Demonstration and Power-Farming Exposition

### THE EVENT

A Tractor and Implement Demonstration and Power-farming Exposition, including over 40 tractors, a score or more of different plows, harrows, scrapers, levelers and other tractor tools, big tent exhibits of all kinds of power-operated machinery for the farm.

### THE PLACE

The University Farm, Davis, California.

### THE TIME

April 17th, 18th, 19th. The Annual Farm Picnic follows on April 20th.

### THE COST

The demonstration and all exhibits are absolutely free of charge,—your only expense is for meals and transportation.

### ACCOMMODATIONS

Make your reservations early through the Davis or Sacramento Chamber of Commerce.

### HOW TO GET THERE

By S. P. train from San Francisco or Sacramento direct to the grounds. By auto to Davis—from there follow the signs—good roads all the way.

This mammoth show will be conducted three days only—April 17th, 18th and 19th—by the manufacturers and sellers of tractors and tractor-implements, on the University Farm at Davis, California. Practically every tractor sold on the Pacific Coast will be in actual operation there in one big field, with the leading makes of plows and other tractor implements. There will be big enclosed exhibits of tractor accessories, gas engines, motor trucks, etc. There will be important scientific tests conducted by the University. There will be much to see, much to learn and the demonstration and exhibits cost you nothing, except your expenses in coming to Davis. Don't fail to take advantage of this opportunity.

Ask your station agent about special railroad rates.

401 Bryson Bldg., LOS ANGELES, CAL.

bottom, and fill the barrel with water. Then cork the hole at the top and pull out the corks below. The water will run into the pan, cover the holes at the bottom, and will then stop until lowered by drinking again. The pan should sit level on a platform five or six feet apart. The hogs will drink at the corners. I have used three different kinds of patent hog waterers, but this is better than all, and cheaper."

### Lime or Lime Rock

Which is the best, the sugar factory lime or the ground lime stone for the average conditions of our Southern California soils? — Subscriber, Anaheim.

In this case we would use which-ever could be secured at the most satisfactory price. Bear in mind also that the sugar factory lime carries a very small portion of phosphoric acid and a small quantity of humus forming material. We do not think there would be any chemical difference.

### What to Plant

We own a small valley which contains about 30 acres from hillside to hillside on the north, and south and a cliff on the east, thus leaving the only opening toward the west and the ocean which is about half a mile distant. The soil is deep and of a sandy nature and is rich in vegetable mold since it is overgrown with sumac and other bushes of like nature and has never been under cultivation. What kind of producing tree would be most profitable to plant in such soil? Its elevation is about 50 feet above sea level and there is never any frost. Would walnuts do well there, and what would be the greatest drawback we would have to contend with? What is the average yield of one walnut tree when full grown? How soon after planting do they begin to bear fruit? We would also be grateful if some grower of walnut trees would write us his experience.—Subscriber, Del Mar.

Nothing is said about the water supply, which is essential in growing any kind of fruit tree. If there is a good supply of water lemons can be grown, and possibly apricots and walnuts will do well. Apricots ripen their fruit early and so will not require as much water as lemons and not require the late irrigation walnuts should have to make them fill well. The average crop of fruit of any kind is not what one should endeavor to produce as there is very little profit in the average crop, hence if the conditions are not such that special endeavor will produce more than the average the land should be used for other purposes. We think the land in question will produce better returns planted to beans than it will in fruit trees.—J. B. N.

### Angora Goats

Can you give me any information as to Angora goats? Where can one get pureblooded stock and at what price? Will the government furnish money to help one get started in this enterprise?—Subscriber, Holtville.

There are many Angora goat breeders in this state and other Coast states and pure blooded stock may be secured from them at prices ranging from \$10 to \$1000. This industry is proving profitable and we doubt not will extend in many sections where cheap pasturage is available. As to government aid that depends entirely upon the land, title, and value. The federal farm loan bank will advance money only on agricultural lands of known value. There is no department of the government which will advance money other than on such credit. For information regarding this write Federal Farm Loan Bank, Berkeley, California.

## VEGETABLES IN NORTHERN CALIFORNIA

Continued from Page 433

the dried state to use in the kitchen. A few hours' soaking will bring them to almost the stage of fresh peas. It is a real war crop.

### Turnips

Make successional sowing. Early Snowball, a quick maturing and superior turnip, should be grown for this purpose. Those sown last month will need careful thinning some time this month, and an application of soot well dusted along the rows will help. This is a very valuable but little known fertilizer. It also acts against insect pests.

### Carrots

Thin this crop during the month as advised in our last notes; also continue to sow French Forcing.

### Beets

Make a sowing of Crosby's Egyptian and Morse's Improved Blood Turnip. Sow in rows 18 inches apart and thin as advised in our February notes.

### Lettuce

Make successional sowings of Los Angeles and May King and thin those sown last month. Use the strongest plants for transplanting six to eight inches apart.

### Onions

If thinning this crop has not yet been completed it should be attended to at once, and as this is a most valuable crop no thinnings should be wasted; if you are unable to plant these young seedlings out yourself give them to a friend who can use them. This is a war time crop also.

### Parsley

A sowing of Moss Curled or Double Curled should be made for late summer use. Later it may be thinned and transplanted.

### Tomatoes

Planting will be safe after about the first week in the month. The method usually adopted when planting a large acreage is to twist a small piece of newspaper around the plant and set in the ground this way to afford protection until the young plants become established. They should be planted four to six feet apart each way and will need careful watering for a time until they start to stand upright which will show they are getting established. They will mature in about 150 days.

The usual method in California is to allow the vines to ramble along the ground, but they are also grown tied to stakes carrying up one, two or three main stems, and picking out the young lateral shoots which develop in the axils of the branches. Oftentimes only about three bunches of fruit are allowed to develop on the main stem, which of course tends to produce superior fruit, but we have also seen splendid fruit grown on those plants which have been allowed to ramble undisturbed. The tomato is a rank grower, hence will require a fairly rich retentive soil. It is subject to several fungoid diseases, and as the spores from these winter in the soil it is not advisable to plant two years running on the same site.

### Corn

We think that every one with the available land should plant this important crop; it is the premier substitute for wheat and is likely to become a war winning factor. It is fairly easy to grow and gives good returns. There are numerous varieties for table and stock feed. For garden sow the popular varieties, Country

Gentleman, Golden Bantam and Golden Cream. Plant three feet apart each way, sowing three to five seeds in a group in rich soil, and after the crop is established keep the cultivator busy. Never let the cobs get over-ripe if you would have sweet tender table corn.

For field cultivation sow three to four feet apart each way. The varieties Morse's Hybrid Yellow Flint and Stanford Yellow Dent are excellent producers.

### Squash, Muskmelon and Watermelon

Make up small mounds with some richly manured soil, taking care to keep the manure at least 12 inches or more below the surface, and have these four feet apart each way. Sow two to five seeds to each mound and water well after sowing. The following squash and pumpkins are recommended: Early White Bush Scallop, Boston Marrow and Hubbard; pumpkins, California Field and Morse's Marrow. The Vegetable Marrow is a European type, classed here with the squash. The best muskmelons are Goldlined Rocky Ford, Bay View, Persian, Honey Dew and Golden Beauty Casaba; watermelons, Georgia Rattlesnake, Angeleno and Kleckley's Sweets.

### Cucumber

The same cultural methods as advised for squash and melons will apply to this crop. They are like the above mentioned, likely to succeed best in richly manured mounds and should be well irrigated throughout the summer. Sow late in the month Arlington White Spire, Long Green, Boston Pickling and the Lemon, a small lemon type cucumber, excellent for table.

### Peppers

These may be sown in pots or boxes at once, placed in a warm situation and later transplanted to the open ground, or plants may be secured from your local nurseryman. The most popular are Chinese Giant, very largely used for stuffing, Pimiento pepper, very mild flavor, Red Cherry and Red Chili used in sauce making. Plant six inches apart.

### Okra

This little known vegetable is used largely in soups and also boiled when young, the seed pods being used. Seeds should be sown as advised for peppers, and the following are good varieties: Mammoth Long Pod and White Velvet.

### Egg Plant

Sow seed as advised for peppers and follow same cultural directions. Black Beauty is the best variety.

### Leeks

These, if sown in February as advised, should now be making fine seedlings and may be transplanted to boxes or a small seed bed about four inches apart. Prepare trenches 18 inches deep richly manured for this crop.

### Celery

Make up a box of fairly rich soil and place in a warm situation. Sow Golden Self Blanching, Columbia and White Plume. Trenches should be prepared as advised for the culture of leeks.

### Beans, Runner and Dwarf

For the garden the varieties generally grown are Pole or Runners, Kentucky Wonder, Scarlet Runner, and Burger's Green Pod. Among the dwarf beans are Golden Wax, Davis White Wax, Refugee and Stringless Green Pod. For dry districts a very profitable shell bean is the White Tepary. The Canadian Wonder is a very hardy variety and the pods are used while young.

Sow the seeds in rows 18 to 20 inches apart and keep the ground well cultivated between the rows. They enjoy a light soil and should not be sown much before the middle of the month.

## The Steinway Piano

The Steinway is the one Piano known and used throughout the world. Wherever Pianos are sold, the Steinway is carried by the leading Piano Dealer as his leader.

The Steinway is the Piano used by all of the world's greatest pianists, vocalists and instrumentalists.

The Steinway is the Piano used by the great majority of the best teachers of music throughout the world—on the Pacific Coast over a thousand teachers use the Steinway.

There must be a reason why the Steinway is so preeminent. Indeed, there are scores of reasons why—mere words here cannot adequately express them—but if you will accord us the opportunity, we will gladly show you why.

The Steinway is universally acknowledged the Standard by which all other Pianos are judged. In spite of its manifest superiority, the prices for Steinway Pianos are no higher than asked for competing makes. Convenient payment terms may be arranged if desired.

We invite you to call at any of our stores—or write us asking for illustrated catalogues and prices.

*We are dealers in Steinway and other Pianos, Pianola Pianos, Aeolian Player Pianos, etc.*

### A WAYFARING PSALM

He leadeth me in the lowly path of learning,  
He prepareth a lesson for me every day;  
He bringeth me to the clear fountains of instruction,  
Little by little he showeth me the beauty of truth.

The world is a great book that He hath written,  
He turneth the leaves for me slowly;  
They are all inscribed with images and letters,  
He poureth light on the pictures and the words.

He taketh me by the hand to the hill-top of vision  
And my soul is glad when I perceive his meaning;  
In the valley also he walketh beside me,  
In the dark places he whispereth to my heart.

Even though my lesson be hard, it is not hopeless,  
For the Lord is patient with his slow scholar;  
He will wait a while for my weakness,  
And help me to read the truth through tears.

—Henry Van Dyke.

### SUSIE BONNEY'S DOG

**T**HE old yellow dog, rousing all too leisurely from his nap in the roadway, was hurled in a tumbled heap into the weed-grown gutter in front of Lem Staniford's grocery, as the rushing automobile sped by in a cloud of dust. A moment later, in response to his piercing howls of protest, Lemuel, Lucius, his clerk, a customer or so, and the entire informal social club that held perpetual session on Lem's upended barrels and boxes had boiled over into the street and gathered round the victim. Uncle Si Bonney, with a half-sobbing exclamation, dropped to his rheumatic old knees and began feeling for injuries.

"Feller in the devil-wagon never so much as looked back," said Uncle Eli Emmons indignantly. "He ain't killed the poor critter, has he, Si? He'd oughter be arrested—runnin' down a

peaceable dog that might's well ha' been a person as not, and streakin' ahead like blazes, never carin' what he left behind him. He'd oughter be shot! Ye can't do nothin' with Jugo-Nuts like that 'cept pot 'em as they pass. It's Susie's dog, ain't it? I wisht I'd hed my old pistol; bet he wouldn't ha' got round the turn then!"

"You'd ha' given some of us a turn, though, Uncle Eli," remarked Lem good naturedly. "That pistol of yours is about as likely to go off one end as t'other. Say, Uncle Si, is he hurt bad? Susie'll feel awful!"

"I dunno whether he's hurt bad or not," quavered Uncle Si, continuing to explore tenderly, while the dog winced occasionally from his hand with a warning snap that was a warning only, followed immediately by an apologetic lap of the moist tongue. "There, there, Zip! Poor old Zip! Poor old boy! My land, I dunno what Susie'd do if he should hev to be killed. I gave him to her myself, her fifth birthday, when he was a pup, and she named him Zip, straight off, and they've grown up together. Zow-ee! Lie still, I tell ye, Zip! That you, Dr. Pedbury? My, my, I'm glad you was passin'! Say, I don't s'pose you calc'late to tend out on animals, but the poor critter's Susie's dog—"

"Compound fracture of the wagging apparatus, doctor?" inquired Lem jovially, as Dr. Pedbury jumped down and began to investigate. "I thought so! Somethin' mighty wrong with old Zip's tail when it ain't waggin'!"

"Couldn't ye splice him up in splints someways, doctor?" begged Uncle Si. "He's pretty old and I dare say 'twould be sense to chloroform him, but I jest darsn't face Susie and tell her!"

Dr. Pedbury shook his head. "Bone too badly crushed. I could amputate, though. A docked tail isn't so bad; maybe Susie'd think it was stylish. My own little girl's got a pup; she'd love him just the same if he limped on three legs and hadn't an ear to cock or a tail to wag. How about amputation, Uncle Si?"

Promptly the suggestion was accepted. Lem's shed became an improvised hospital, and Dr. Pedbury operated before an interested audience. Zip stood it well, but he emerged from the anaesthetic with such an absurdly surprised air, turning his head this way and that to gaze upon a disordered universe, wabbling tipsily upon his hitherto reputable and discreet legs, lolling a reprehensible tongue at his betters and displaying altogether such a pervading air of disolute helplessness, that the onlookers burst into laughter. Nothing further was needed to bring the old dog completely to. Zip hated ridicule. Profoundly mortified, he endeavored to tuck between his legs the tail that was not there to tuck, and crouched tremblingly between Uncle Si's knees.

"It's all right, Zip; it's all right!" Uncle Si consoled him. "Here, you pack of grinning zanies, don't ye know a dog has feelin's? You're a sure-enough bobtail, Zip, old boy, but Susie'll be comin' home from gran'ma's soon, and she won't laugh at ye. Love ye most to death, she will—Dr. Pedbury knows! That's the woman of it, ain't it, doctor? More a feller's bunged up and no account and mis'erable, more they'll fuss over him, like they couldn't do enough. Feel like ye could toddle along home, Zippy? Time we was movin' on."

"No, ye don't, Si!" offered Solomon Fearing, whose hack was standing outside. "I ain't got a passenger; you and Zip hop in and I'll give ye a lift. I had to laugh at the critter, comin' out of his jag, he was so comical; but ye needn't fly off the handle about it."

"I don't know if dog biscuit's the proper sort of invalid diet," suggested Lem, making honorable amends in his turn, "but seein' that guava jelly and blomonge wouldn't exactly meet the case—"

Sam Fynes chuckled, and went one better. "Say, Si!" he contributed. "If ye'll stop to the store, I got a roll of blue ribbon, jest a mite imperfect but awful pretty. Ye might tie a blue bow on the critter, so's he'd look kind of gay and cheerful when Susie sees him fust."

"You're reel kind, all of ye," said Uncle Si, entirely mollified. "Come along, Zippy boy; everyone's your

## A principle that builds quality at least possible cost

It is the principle of specialization.

We do not scatter our vast resources.

We concentrate them upon two or three definite grades at definitely known prices.

Thus, by producing clothes by the most efficient and economical method, we are able to offer you our genuinely famous values.

For Spring '18 Styleplus Clothes will be made in two grades—\$21 (green label) and \$25 (red label). Look for the Styleplus Label in the coat!

Each grade the greatest possible value at the price! You know the price *before* you go into the store!

Styleplus distributors will sell Styleplus Clothes \$17 (black label) as long as their supplies of this grade last.

Write us (Dept. A B) for free copy of "The Styleplus Book."

friend, and you're friends with every one, ef ye can't wag good-by to 'em."

There was the slam of a carriage door and the lessening sound of wheels.

"I wonder," piped up Uncle Eli Emmons reflectively, "ef Zip'll keep right on chasin' Almeria's Manx cat like he's al'ays used to, or ef he'll hev too much feller feelin's?"—Youth's Companion.

#### SUGARLESS SWEETS

By Home Economics Department,  
New York College of Agriculture

**B**EFORE the war practically the entire supply of beet sugar for the world, with the exception of 733,000 tons produced in the United States, was grown in Central Europe in the countries now engaged in the struggle. Germany, Austria-Hungary and Russia alone produced 67.4 per cent of the total beet sugar supply and about one-third of the entire sugar supply of the world. England, before the war the largest importer of sugar in the world except the United States, got nearly a third of her sugar supply from Germany and Austria. With the withdrawal of the sugar exports of these two heavily producing countries, likewise of Russia, and the sugar beet fields of Belgium and part of France in the hands of Germany, it is easy to see why the Allies' supply of sugar has shrunk. To make up this deficiency the United States has exported more than 18 times as much in 1917 and 19 times as much in 1916 as in the three years' average before the war.

These simple outstanding facts make it easy to understand why there is less sugar to be had, with no likelihood of the available amount of sugar being increased until war is ended. Changing our habits in the use of sugar is, therefore, a necessity as long as the war lasts. England has cut down her sugar consumption from 93 1-3 pounds a person a year to 26 pounds, or an ounce a day a person. France is living on a per capita war ration of 18 pounds a person a year and Italy on 12 pounds. What Americans are asked to do is to save seven ounces a week for each person, a reduction from 90 pounds a year a person to 67 pounds. That does not mean even deprivation; it means only substitution of the many sweets available in this country which are not being shipped abroad—for example, maple sugar and syrup, corn syrup, honey and molasses.

In practically all sweetened dishes,

an ingenious cook can substitute other sweetening for the customary white sugar. Some experimenting is necessary in most cases, since the other sugars and syrups vary greatly in sweetening power; and when used in large amounts the effect of the liquid of the syrups must be taken into account. There is so wide a variation in syrups and molasses that it is difficult to give even general proportions. Honey has about the same sweetening value as sugar, maple syrup is sweeter, and corn syrup is less sweet. It has been stated that when a cup of honey is used to replace a cup of sugar, the liquid in the recipe should be decreased one-fourth.

Aside from using sugar substitutes in cookies, desserts and other made dishes that require sweetening, a considerable quantity of sugar may be saved in every household by the conscientious use of some sugar substitute with breakfast cereals, in beverages, and in countless other ways in which sugar has been freely and often unnecessarily used. Raisins, dried strawberries, dried pears, and other dried fruits and fruit pastes may be used on breakfast cereals, or as confections. Fruit marmalades, butters and jellies should be used at this time to take the place of the ordinary sweetening, not as accessories to a meal.

#### Cookies

With a little experimenting other cereals that may be plentiful in certain localities may be used in place of those given in these recipes, but the difficulty lies in the difference in thickening power of the various cereals.

#### Chocolate Buckwheat Cookies

One-third cup fat, one cup corn syrup, one-fourth cup sour milk, one-half teaspoon soda, one-fourth teaspoon salt, three cups buckwheat flour or enough flour to make a stiff dough, two tablespoons melted chocolate, one-half teaspoon vanilla.

Cream the fat and mix it with the syrup. Add the sifted dry ingredients, the chocolate and the vanilla. Roll the dough thin, cut it and bake the cookies in a moderate oven.

#### Peanut Butter Cookies

Six tablespoons fat, one-fourth cup peanut butter, one cup molasses, one-fourth cup sour milk, one-half teaspoon soda, one teaspoon baking powder, three and one-fourth cups buckwheat flour, or sufficient to make dough stiff enough to roll.

Mix the ingredients in the order in which they are given, adding the sifted dry ingredients last. Roll the dough, shape the cookies with a small cutter, and bake them in a moderate oven.

#### Cornmeal and Rolled Oats Cookies

One cup cornmeal, one cup rolled oats, one cup molasses, one teaspoon salt, one cup sour milk, one-half cup fat, one teaspoon soda, one cup buckwheat flour, one-half teaspoon nutmeg, one-fourth teaspoon ginger.

Heat the cornmeal, the rolled oats, the molasses, the salt and the milk together, stirring the mixture constantly until it becomes a thick paste. Remove it from the fire, and add fat and the sifted soda, flour and spices. Allow the mixture to stand until it is cold. Roll it thin, cut it with a small cutter and bake the cookies in a moderately hot oven.

#### WOMEN FOOD AGENTS MEET

Conferences of women directors of food conservation and county food administrators from practically every county in the state were held in San Francisco last Tuesday and Wednesday. Important problems of food conservation and production and the elimination of waste were discussed.

#### New County Administrators

W. S. Fawcett, Imperial County, residence, El Centro; F. T. Maguire, Mariposa County, residence, Mt. Bullion; W. S. Conner, Madera County, residence, Madera, and James T. Negley, Modoc County, residence, Alturas.

From now until next harvest watch your grocery list or there will be no groceries to list.

In 1913, Europe produced 43 per cent of the world's sugar; since then she has had other engagements.

From Kodak Negative

## Kodak on the Farm

Photography serves a double purpose on the farm. In the taking of home pictures, in the keeping of a happy Kodak record of every outing, in the making of pictures of one's friends and the interesting places that are visited, it appeals to country people and to city people alike.

But on the farm it has even a wider business value than in the city. Many city people use the Kodak in a business way. It can be so used on every farm. Its indisputable records, showing comparative pictures of crops that have had different treatments, are invaluable. You see such comparative pictures in the farm papers frequently. You can make them for your own use on your own farm, and they will be of direct value to you.

Pictures of livestock are not only interesting to keep, but frequently such pictures serve to close a sale; pictures have frequently settled line fence disputes; pictures showing the growth of trees, the effects of this and that kind of pruning often prove invaluable to the orchardist.

And you can make such pictures the simple Kodak way. You can finish the pictures yourself—or can have this work done for you. And it is all less expensive than you think.

Kodak catalogue free at your dealer's or by mail.

### 4 H.P.-190 lbs.

The 4 H. P. Cushman Handy Truck is the most useful outfit ever built for farm work. Engine weighs only 190 lbs., and entire outfit only 375 lbs.

Besides doing all farm and household jobs, this 4 H. P. Cushman may be lifted from truck and hung on rear of binder during harvest to save a team. In wet weather it saves the crop.

### Light Weight Cushman Engines

Built for farmers who need an engine to do many jobs in many places instead of one job in one place. Throttle Governed, with Schebler Carburetor. Run very quietly and steadily—not with violent explosions and fast and slow speeds like old-style heavy-weights. Engine Book free.

Lentils .....25.00

### HAY

Quotations by Nichols-Loomis Company. Prices to growers f. o. b. L. A. carlots:

The continued rains have caused a drop in all grades of hay of from \$1.00 to \$2.00. The supply is said to be sufficient to carry till new crop comes in.  
Tame Oat .....28.00@30.00  
Volunteer Oat .....16.00@18.00  
Wheat .....25.00@28.00  
Barley .....26.00@29.00  
Alfalfa .....26.00@28.00

The Alfalfa Growers' Association of Southern California quotes:  
Alfalfa, \$30.00 per ton f. o. b. where the \$1.50 freight rate applies, and \$29.00 f. o. b. where the \$2.50 freight rate applies.

### GRAIN AND FEEDSTUFFS

The grain and feed market is not yet stabilized, and no quotations can be secured, and under the government regulations it seems that it would be practically impossible to give any quotation which will be of any value whatever. On this point the Great Western Milling Company of Los Angeles writes:

"We are getting out a small price list at the present time on grain and feed but we hardly think it would be advisable to publish this inasmuch as prices are not stabilized to any extent at the present time. Each of the mills is selling grain at actual cost plus a profit, and naturally these costs vary considerably, as a mill which has barley on hand purchased two or three months ago at a cost of \$3.20 will be forced to sell cheaper than one that purchased barley recently at a cost of \$3.50 or \$3.60."

## San Francisco Markets

San Francisco, April 2, 1918.

### BUTTER

The quotations on butter are on the basis of solid packed cubes. To ascertain the market price of butter in squares, add to the cubes basis price per pound, as follows:

Two-pound squares, parchment wrapped, ½c; 1-pound squares, parchment wrapped, 1c; 2-pound squares, in cartons, 1½c to 2½c; 1-pound squares, in cartons, 2c to 3c.

Dairy Exchange quotations, lb.:

## HAY

Under date of March 30, Scott, Magner & Miller says:

Receipts past week, 1536 tons. Several consignments to be sold for shippers' account arrived during the week. This is something that we have not seen before this year, as practically the entire crop has been purchased before shipment. This has been caused by dealers being shy about buying ahead, and therefore many of those anxious to sell have not found buyers and are not willing to hold it over at the present prices and wish to cash it before the new crop is available. We believe that the available hay will all be used before new crop. We consider the entire range at least \$2.00 per ton lower than last week.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the market. For prices to consumers charges of cartage, commission and handling must be added according to conditions.

## Citrus Fruit Market

## Shipments

Shipment of citrus fruit from Southern California since November 1, 1917: Oranges, 6273 cars; lemons, 1650; total, 7923 cars. To same date last season: Oranges, 15,631; lemons, 2754; total, 18,385. From Central California to date this season: Oranges, 1998; lemons, 113; total, 2111. To same date last season: oranges, 4052; lemons, 164; total, 4216. From Northern California to date this season: Oranges, 203; to same date last season, 843.

## AT THE AUCTIONS

## March 27

New York: 12 oranges, 5 lem. Nav. 4.05-8.90, Seed. 5.80-6.40, Sweets, 6.65-7.00, lem. 4.85-6.65.

Boston: 8 cars, Nav. 4.50-7.50, Seed. 4.65-6.55, lem. 5.30-6.25.  
Cleveland: Nav. 3.50-6.85, Seed. 7.05, lem. 6.10-6.30.

## March 28

New York: Nav. 3.85-7.55, Sweets, 3.65-7.30, lem. 4.25-4.60.  
Boston: 7 cars. Nav. 3.90-6.50, Seed. 5.50-6.50, lem. 5.40-6.05.

## April 1

New York: 20 oranges, 8 lem. Nav. 3.15-8.40, Val. 5.05-5.95, Seed. 4.80-5.85, lem. 3.35-4.80, Tang. halves, 3.15-3.80.  
Cincinnati: 1 Nav. 1 lem. Nav. 6.45-6.90, lem. 6.40-6.80.

Boston: 12 cars. Nav. 4.10-7.10, Seed. 5.65-6.85, lem. 5.20-5.85.

## PARTIAL LIST OF FRUIT SHIPMENTS

From post card reports to the bureau of markets, United States department of agriculture, Miss Hoey makes report of the following shipments from California for the week of March 25 to April 1: Apples, 2; artichokes, 29; asparagus, 13; cabbage, 40; cauliflower, 105; celery, 47; fresh peas, 3; dried apples, 2; dried apricots, 2; dried beans, 33; dried peaches, 13; dried pears, 2; dried prunes, 19; lettuce, 89; mixed vegetables, 109; mixed fruit, 6; mixed fruit and vegetables, 2; mixed dried fruit, 3; onions, 7; potatoes, 45; raisins, 36; dried peas, 1; radishes, 1; rhubarb, 35; Mexican tomatoes into state, 25.

## MARKET NOTES

Celery growers of Florida have suffered greatly because of glutted transportation, and some producers have been ruined.

The first car of Valencia oranges shipped from Tulare County sold around \$7.25.

The potato market has been most disturbing, especially in California where \$1.00 and \$1.10 prices have prevailed. Eastern points report anywhere from \$1.00 to \$1.45.

Texas is reported as shipping immense quantities of onions. The output it is estimated will run close to 7000 cars. The car shortage is complicating the situation.

The Poultry Producers of Central California transacted practically double the business in February 1918 that it did in February 1917. Total cases handled, 6743.

## SWINE BREEDERS MEETING

Continued from Page 439

ting a wider margin than at first appears.

A fact that producers must not lose sight of is this, while the packers need to reform some of their practices, they are operating under conditions that do not obtain in the big primary markets of the corn belt. The average hog killed by California packers is a lower dresser than the Eastern hog. And further, the per-

centage of condemnations is alarmingly high in this state.

The next factors to consider are those relating to better methods of feeding and better hogs. Education is fast working improvement as regards feeding methods and better hogs. Both of these factors will eventually work themselves out satisfactorily and logically. The present high price of feed is causing the feeder to study the food problem more carefully than ever and is demonstrating that the efficient hog is the pure bred or high grade. As a matter of fact, a great many producers are selling their grade and scrub sows and are replacing them with fewer, but better bred animals.

From the above it must be evident that the business of pork production is facing several big problems, some of which are local so far as California is concerned. Some of the problems will be difficult to solve and their ultimate solution will depend on many unforeseen factors.

Some of the problems, especially those relating to marketing, are capable of solution providing the producer and the packer view the situation in a big constructive way. Each is dependent on the other and must be willing to do the fair thing. The proposition of cooperative marketing is one that is sound to the core and

can be made to save shippers the margins that have heretofore gone to the middleman. The question of feeds is the most difficult of solution. It is well to know that the various swine associations are alive to the situation and are not overlooking any opportunity to bring about more satisfactory conditions. Much has been accomplished, more remains to be accomplished, and the future demands that every man do his part.

## ON THE COAST

Secretary F. W. Harding of the American Shorthorn Breeders' Association is now on the Pacific Coast in order to get in closer personal touch with the Pacific slope Shorthorn activities.

He will be in attendance at the California Shorthorn Breeders' annual meeting and sale and will visit various breeding establishments in the coast country in other states.

## “ — and it builds them up”

From the time they are about five weeks old until they are eight weeks old, chicks require nourishing food, but not too violent or heating — in order to effect a good, healthy growth.

Remember — growing chicks are live, active little fellows and always hungry. They will eat anything and take on fat very fast. Therefore — you must be doubly careful about the food you give them. Otherwise they are apt to become too heavy for their legs and be troubled with indigestion. This retards their growth. Result? They become neither good layers nor good breeders.

If you want profitable chickens — give your growing chicks **SPERRY SUREGROW**. It contains the essential food units which growing chicks must have to build bone and muscle. It is economical, dependable, and it builds them up. It helps them “over the top” of their critical period.

The money you invest in **SUREGROW** will come back to you many times over in the increased health and vigor of your flock. You won't have to worry about digestive troubles, moulting and slow growth of chicks if you use this balanced ration.

The new edition of the Sperry booklet, “Makes Hens Happy” gives you the advice of practical poultry experts. It contains information that will help you to materially increase your poultry profits. A copy is yours for the asking — send for it today.

## **MAXWELL TRUCK**

This truck costs little more than a first class team, wagon and harness. Costs less when you figure up-keep. Eats only when it works. Requires one-twenty-fifth the care and attention horses do. Travels the 7 or 12 or 16 miles to market, under load, in one-fourth the time.

The farm hand who formerly took all day to drive to mill with a load of grain can now go and return in two hours.

Here is a truck with all the features of \$5000 trucks, and sold under the same guarantee. Worm drive. Electric lights and generator. 10-foot loading space. Gas consumption, 16 miles to every gallon. A tire miser. Mechanical trouble practically unknown. Repair bills are too low to mention.

This Maxwell is built for the farm. Weighs 2500 pounds. Goes faster than heavier and more expensive trucks and goes where they daren't follow.

6600 Maxwell trucks are in service. 1100 on farms. Service records show a verdict of 99.6% perfect based on all the trucks now in use. You'll find no mechanical faults in the Maxwell. A safe investment and a paying one.

You save \$400 the day you buy this Maxwell truck, for its price is \$1085. And \$1085 is \$400 less than any other truck of similar capacity on the market.

\$1085 Chassis only, f. o. b. Detroit. Electric lights. Electric generator. Worm drive. 10-foot loading space. 2500 pounds. 16 miles on a gallon of gas.

## More Land Without Buying It

Discontented Farmer Finds a "Farm Under His Farm" and Produces More Without Greater Investment. Written for California Cultivator

**T**HE farmer, who was made discontented with his lot in life by the story of a traveller who stopped at his house over night and told about an acre of diamonds somewhere in the world, sold his land and started out in quest of this great wealth.

After traveling for many weary years he returned, unsuccessful, to find that the purchaser of his farm had discovered coal under it and was wealthy.

Away off somewhere, at the foot of the rainbow, there may be a pot of gold, but it's a long and weary chase.

Dr. Van Hise in an address before the extension division at the University of California in February pointed out that there has been greater advance in science in the last 60 years than in the past 2000 years. Dr. Van Hise is the president of the University of Wisconsin, the agricultural college of which is one of the foremost farm schools in America.

He said that if the farmers in America would put into practice the proven scientific discoveries of the agricultural colleges that the crop yield would be doubled. There you have the reason for the heading of this article: More Land Without Buying It.

At the state fair at Sacramento last year a farmer told of experiences whereby crops had been doubled. He was careful to mention particulars and attributed the results to deep plowing. He said that with horses it was not practicable to attempt deep plowing in dry hard soil. With his tractor and plow, however, he had turned up ten to 14 inches of soil, the lower strata of which had never been called upon to add the strength of their fertility to the producing of a crop.

He plowed in the dry hot season between harvest and the fall rains, when the ground was baked, and the disk plow ripped it up in big clods, leaving the surface rough and uninviting to look at or walk over. The nitrogen in the air, however, permeated every crevice and awakened to productive life the latent power of fertility in each particle of this new, fresh soil. When the rains came the clods were already softened by the effect of the air, and welcomed the fructifying water. The clods disintegrated and melted into mulch, ready for the cultivator and the seed drill.

The result was a double sized crop. In other words, he had utilized double the number of acres without buying them. He had utilized the time between seasons with his tractor and made possible a crop production never before believed obtainable.

By rotating crops, by proper seed selection, by plowing under nitrogen-bearing growths and other methods, the farmers have improved production.

There are many advantages still to be obtained by using the proved scientific methods hinted at by Dr. Van Hise. But it can hardly be questioned that by deep plowing the result can be otherwise than favorable. By this method you call to your aid the stored-up forces of nature, release them to serve you, as the surface above plow-pan has done so long.

It is recognized, that, of course, to accomplish this result, you must have the equipment with the sufficient power to go down deep in the hard dry soil. That requires the force of a powerfully built tractor, one constructed to withstand the shock of contact with the resistance of 14 inches of hard-baked ground.

The farmer quoted above has a one-man outfit consisting of a sturdy tractor and field disk plow, and he makes them pay big dividends on the investment.

various types which have been brought into existence, the layman is in danger of confusion unless he studies a bit into the underlying principles of these different forms of power. Those who have attended tractor schools have had this fully explained by use of models before the classes, showing the various steps in the operations. At the Riverside school Prof. Davidson went fully into the construction and operation of the gas engine. An outline of his lectures has been given to us, and, while it is somewhat like a textbook, it has a

UNCLE SAM - "WELL HERE'S A SCRAP o' PAPER HE WON'T DESTROY IN A HURRY"

### THE TRACTOR ENGINE

**A**LL of us have a crude idea of the principles on which the original gas engine worked, but with the modern improvements and the

fund of information for the farmer who is contemplating purchasing a tractor, so we give that portion touching upon the engine almost entire:

...

PROF. J. B. DAVIDSON

The gas engine which furnishes power for the gas tractor is a heat engine. Its function is to convert the energy released by the combustion of fuel in the form of heat into mechanical energy, the energy of motion. The fuel is usually a petroleum product, such as gasoline, distillate, or kerosene. Natural and coal gas may be used in stationary engines where the fuel is available, and alcohol could be used if cheap enough. The liquids, however, must be converted into a gas or finely divided spray before combustion, so, in reality, all of such engines may be properly styled gas engines.

#### Internal Combustion

The gas engine is an internal combustion engine, the furnace is literally transferred to the inside of the engine. The process consists in mixing air and fuel in the form of gas or vapor in the proper proportions to support combustion and igniting them in a closed cylinder. The release of heat causes a sudden rise of temperature and a corresponding rise of pressure. This pressure is allowed to push on a moving piston doing work.

#### Combustion

The combustion of the fuel and the air mixture takes place so quickly that it partakes of the nature of an explosion, but it is not an instantaneous process. It takes a fraction of a second, say 1-200 to 1-50, for the flame to travel from one part of an engine cylinder to the other.

#### Advantages

The gas engine has many advantages over the external combustion engine usually represented by the steam boiler. The principal advantage is in the efficiency of the use of the fuel. Higher temperatures are realized and there is less heat carried away by the exhaust where a non-condensing engine is considered. The engine is of light weight and automatic in its action.

#### Disadvantages

The principal disadvantages of the gas engine are that there is no storage of heat and there are several distinct and necessary operations that must be performed at regular intervals.

#### Compression

The modern gas engine requires compression of the mixture of fuel and air or of air before combustion. The purpose of this is to secure higher temperatures, meaning greater efficiency and a smaller engine. This method is usually referred to as the Otto Cycle. Theoretically, the efficiency of a gas engine varies with the compression pressure but there is a practical limit to this compression. The compression pressure for gasoline is about 70

## Dairying in Relation to the Citrus Industry

By H. E. Van Norman, Dean University Farm School, Davis

WELL recognized students of the broad problems of agricultural development point out that no permanent system of agriculture has been built up that does not involve livestock as a part of its scheme. So well recognized is this in England, where long leases of agricultural lands are in vogue, that by legislative enactment there is provided a legal basis for allowing credit to the tenant for the manurial value of feeds bought and fed on the place. Also an allowance is made for the value of animal manures added to the land and which the renter may not have had the benefit of before giving up his lease.

Farm management investigations in the United States show that as a rule a single crop is less profitable in the long run and has rarely endured. It is a popular saying "that it is a wise man who does not put all his eggs into one basket." There seems to be an inter-dependence among agricultural crops that is essential to permanent agriculture. The great wheat areas of New York State, of the Red River Valley, and of the great Central California valleys have each in turn given, or are giving way to a diversified agriculture. A prominent apple grower in an Eastern state who has devoted a lifetime to the business and counts his primary business that of an orchardist, said that early in his experience he found it necessary to add a dairy herd for the purpose of fertility and also to insure the employment throughout the year of a group of men who became the leaders and pacemakers for the extra labor required during the seasons of peak load. An eminent grower of deciduous fruits in the Sacramento Valley finds that in order to market the crops that he finds it profitable to raise between his trees, he must have a dairy herd and pure bred at that. Also since his market for dairy products is cream, he raises pure bred hogs to market the skim milk. Prof. Shamel tells us every orange grower is also a dairy man.

And now comes the distinguished director of the citrus experiment station and tells us that the permanency of the citrus industry in California is going to depend upon its adoption of some form of animal husbandry as a contributing side line.

The industry must secure a dairyman for a partner or a neighbor, for, of course, the orange grower will not himself milk cows. Unfortunately, just when he has come to appreciate the value of stable manure from the city, the horseless wagon and carriage curtail the supply of manure, and a growing appreciation by the orchardist of the value of this material has brought about such competition for the decreasing amount that it has forced the price skyward. And yet we are told that the future of the citrus industry depends upon the development of a supply of animal manure to provide the nitrogen and organic matter for our orchard soils.

It would indeed be sad if a too long self sufficient California should find itself forced to follow the example of older states and appoint another commission some time in the future to study the problem of California's "abandoned farms" (i. e. abandoned

orange ranches), and provide shelter and maintenance for superannuated, jobless real estate merchants in this wonderful Southland; all because of the failure to heed the admonition "grow livestock and make manure to save the orange orchards."

Dr. Webber, in asking me as a dairyman to present some dairy facts for your thoughtful consideration, when the dedication of these buildings gives a new impetus to the development of the citrus industry, remarked in substance, "The more I study this problem the more I am impressed with the interlocking dependence that the many branches of agriculture have upon each other." As truly as that 'no man liveth to himself,' no branch of agriculture prospers alone indefinitely.

Assuming as a starting place in this discussion that each citrus tree requires 1½ pounds of nitrogen, an acre of 90 trees would require 135 pounds of nitrogen annually. Alfalfa is California's wonder crop in its ability to take the nitrogen from the air of the soil and lock it up in the plant. When fed to dairy cows 75 per cent of this nitrogen is voided in the manure, solid and liquid. Allowing the yields referred to in Circular 121, California experiment station, we have the following amount of nitrogen voided from the consumption of given yields of alfalfa hay by dairy cows:

### Amount of Nitrogen in Manure From Varying Yields of Alfalfa

Average state yield 3.5 tons of alfalfa per acre would furnish 210 pounds nitrogen in manure.

A safe estimate 5 tons alfalfa per acre would furnish 300 pounds nitrogen in manure.

A good yield 6 tons alfalfa per acre would furnish 360 pounds nitrogen in manure.

Extra good yield 8 tons alfalfa per acre would furnish 480 pounds nitrogen in manure.

### Amount of Alfalfa Hay Required by Cows of Various Capacity

To produce annually	Alfalfa required	Nitrogen voided in solid and liquid manure
160 lbs. butterfat	4.8 tons	288 lbs.
200 lbs. butterfat	5.0 tons	300 lbs.
250 lbs. butterfat	5.5 tons	330 lbs.
280 lbs. butterfat	5.7 tons	342 lbs.
300 lbs. butterfat	6.0 tons	360 lbs.
320 lbs. butterfat	6.1 tons	366 lbs.

A thousand pound cow producing annually 300 pounds of butterfat will require about six tons of alfalfa hay, which is the product of one acre of good alfalfa or its equivalent, to support her for one year.

If one acre of hay furnishes 360 pounds of nitrogen in the manure, allowing 1½ pounds per acre per tree, or 135 pounds per acre, there will be provided the necessary nitrogen for 2.6 acres of trees, providing all the nitrogen could be saved.

Since this is impossible, because of the difficulty of securing it all, preventing loss by decomposition, etc., we may figure that an acre of alfalfa would supply sufficient nitrogen for only 1½ to 2 acres of trees, depending upon the efficiency of the methods employed in saving it and on the amount required per tree. There are many questions that will arise, as for instance, the use of bedding to absorb the liquid manure, and the source of its supply, and the proper methods of

handling cow manure if bedding is not available. The discussion of these cannot be entered into at this time.

From the dairy standpoint, there must be provided a market for the milk; in the form of cream for butter making this can nearly always be secured. Prices for butterfat for the next few years are likely to run from 40 to 60 cents per pound, which with a yield of 250 to 300 pounds would suggest a gross income of from \$100 to \$135 per cow per year, leaving skim milk to be fed to calves or pigs, or both. Five to six hundred pounds of skimmilk can replace 100 pounds of corn, or similar grain, in the feeding of growing pigs. With an almost limitless market for good dairy cows, emphasis on the good, in the milk producing herds for our city milk supply, the raising of heifer calves on this skimmilk should offer a suitable market for it. If the whole milk can be sold for city consumption, present prices would indicate a market of from 70 cents to \$1.00 per pound for butterfat, less transportation.

With an era of high cereal prices and rising wages for farm labor because of war conditions; with the greater or less reduction in herds because of the discouragement over the failure of dairy products to rise in price as rapidly as other commodities, I anticipate increasingly attractive prices for dairy products for some years to come.

To insure the final success of the dairy branch of the industry, there should be included in its organization:

- (1) Facilities for the saving of the maximum amount of liquid and solid manure;
  - (2) The use of the best dairy types of cows irrespective of breeds or breeding;
  - (3) The feeding of every cow daily to her full working capacity;
  - (4) The keeping of systematic records of production as a guide and basis for the elimination of the unprofitable;
  - (5) The use of pure bred sires from cows of known producing ability;
  - (6) The replacing of the herd by high grade daughters from such a sire and the best producers of the herd.
- Cooperative effort in the marketing

of products; in the conduct of the testing and record keeping by means of cow testing associations; the co-operative purchase of pure bred sires; and the adoption of one definite breed in a community, all make for community prosperity.

So far, we have dealt with the dairy as an individual problem, leaving it to the individual to decide whether he can raise alfalfa between young or old trees and keep cows enough to consume it, or whether he must replace part of his present orchard with alfalfa, or whether he must buy or lease additional land on which to establish a dairy sufficient in size to supply his orchard's needs for nitrogen.

But the problem as I grasp it is larger than that of the individual. I am told we have planted orchards on all kinds of land, high and low, rich and poor; that the handwriting on the wall already suggests that there are lands planted to orchards on which the expense of heat for frost protection is a burden too great to permit of a permanent profitable industry; that it may be necessary ultimately for these lands to be converted into alfalfa fields and the product fed to cows, and the manure spread on the bordering higher lands which the frost slips past as it settles down onto the less fortunately located area.

It may be that this problem of the relation of the dairy to the citrus industry is a community problem in which leaders of thought in the industry must seek to see established in suitable locations that type of citizenship which makes dairying a success and that further type of co-operation which makes it a supplement to the citrus industry.

History seems to show that cotton, corn, wheat, fruits, in fact no single crop promises a permanent agricultural industry unaided or unsupplemented by other branches of agriculture; and as the grower of single cereal crops has had to change his practice or cooperate with the livestock man or give way to men who would do so, perhaps there is a handwriting on the wall for the citrus grower which as it becomes plainer will read, "Raise alfalfa to feed cows to make manure to save the citrus industry."

## Frost Dates

Dr. Ford A. Carpenter, meteorologist of the United States weather bureau at Los Angeles, gives the following dates as to spring frost occurrence, covering the period of years from 1912:

### Last Occurrence of Frost Temperatures by Years and Dates

Temperatures of 32 to 29 degrees inclusive, dates without marks; 28 to 25 degrees inclusive \*. Records for 1918, to March 23 inclusive.

## Makes Farm Work Easy

### IS there an International Harvester Mogul Kerosene Engine on your farm?

This is an important question because

few factors contribute more to farm life, in the way of economy, time saving, comfort, and lasting satisfaction, than the right size and type of Mogul engine.

You don't mind the lack of hired help nearly so much when you have a Mogul engine to do the chores. Morning and night it takes care of the jobs that used to be so tedious and tiresome. It does not get tired or quit just when you need it most. When you find how useful it is and how cheaply it works, you buy more labor-saving machines for it to run until it is doing all the power jobs on the place.

Mogul engines are the standard steady reliable power. They are designed, made, backed and guaranteed by a manufacturing experience that grew out of three-quarters of a century of good farm machine building. They work economically on the cheapest engine fuel you can buy—kerosene or distillate. They start easily. They run steadily. They serve you well for years.

Buy Mogul power and run your farm more profitably and with less labor. See the dealer and write us for catalogues describing Moguls ranging in size from 1 to 50-h. p., in all styles, for all purposes, all using kerosene for fuel.

of the motor, while another may even take the A. L. A. M. rating. Some-time, and the time is very likely near, when the farmer purchases his tractor, it will be definitely known by him just exactly what is meant by a "20 H. P. machine." Just what this will be cannot be told, but it will in all probability boil down to either the mechanical horse power of 550 foot pounds per second, or a carefully defined horse.

In the computation of power the two quantities that must be measured each time are the pull at the drawbar and the speed of the tractor, not of the motor. These two quantities can be easily obtained, the first by some kind of spring scales and the latter by laying off distance stakes.

Knowing then that the mechanical horse power is the result of dividing the product of pull in pounds and the distance traveled in feet per second by 550 it is very easy to obtain.

"H. P. equal 2.666 times pull in thousand pounds times miles per hour." And as an approximate rule it might be taken that the "H. P. equals five times the pull in tons times the speed in miles per hour."

In the accompanying diagram the drawbar pull in thousands of pounds is laid off horizontally and the mechanical horse power is laid off vertically; radial lines are speed lines. To obtain the horse power follow the line vertically that corresponds to the drawbar pull until it intersects the proper speed line. Then the horse power is on the horizontal line passing through that point, and can be read off on the scale at the extreme left margin.

For example: What is the horse power of a tractor pulling 5000 pounds and traveling at a rate of three miles per hour? Answer: 40. Follow the lines A.B.C.

Just inside the H. P. scale the equivalent horse pull is laid off. This horse pull is based on an animal that will exert a pull of 185 pounds while traveling at the rate of two and one-quarter miles per hour, and is equal to 1.08 mechanical horse power. For example: The equivalent horse pull in the above case is a little over 36 horses.

By knowing the speed at which any tractor is traveling, and the actual pull on a dynamometer, its real horse power can be calculated.

For instance: The model 20-35 with a 5000 pound drawbar pull at 2.06 miles per hour is equivalent to 27 mechanical horse power, or a little over 24 equivalent horses. The model 12-20 with a 3400 pound drawbar pull at two miles per hour does the work of 18 mechanical horsepower, or 16 equivalent horses.

### THRIFTY ADVANCE

The gospel of war stamps and thrift stamps is being advanced in almost every conceivable way all over the United States. One of the best schemes we have yet learned of is that being worked out by the employees of the Killefer Manufacturing Company of Los Angeles. They were recently granted a ten per cent increase of wages, and they unanimously elected to accept this ten per cent increase in thrift and war stamps, this to cover the entire year of 1918. Last Saturday night's thrift stamp collections by these employees aggregated \$111.25. Besides this, one day's liberty loan drive resulted in \$1500 worth of bonds being sold to the same wage earners. Incidentally we may say this is the third advance in wages of the employees of the big concern which makes so many dependable soil working tools.

California Sprayer Co.,  
6029 Pasadena Avenue, (Copy)  
Los Angeles, California.

Dear Sir:  
In reply to yours of the 31st of January, I would say that I used your "American Beauty" last season on my 10 acres of Valencia oranges according to the instructions you personally gave on my visit to your factory with extremely satisfactory results.

I dusted 840 trees, working from about 7 o'clock in the morning until about 10 o'clock during the foggy period. My man was able to do approximately 50 trees an hour, and I used about 100 pounds of sulphur.

I figured the whole expense at about \$12 for 10 acres, labor and material, and certainly the results were extremely satisfactory.

The reason I purchased your rig was that I saw it used with entire satisfaction on a 100-acre ranch, and my results were equally good with the ones that I saw.

Yours very sincerely,  
H. E. COLLINS.

Vice-President  
Agricultural Chemical Works.

## Irrigation and Crop Control

From Address by Pres. J. A. Widdsoe of Utah Agricultural College at Dedication of Citrus Experiment Station at Riverside.

WHEN the quantity of water offered a crop is varied, there is a corresponding variation in the yield obtained. In general, the old idea holds, that the more water is applied the larger the yield of the crop, but only within narrow limits. The outstanding fact is, that the more water is applied, the less the crop return for the additional water used. For example, one investigator found on a deep fertile soil, in a district where the annual precipitation is about 13 inches, that five inches of irrigation water yielded 38 bushels of wheat to the acre, and that 25 inches, or five times as much water, gave a yield of 47 bushels, or only nine bushels more. In other words, if the 25 inches of water had been spread over five acres of land, 190 bushels of wheat might have been harvested as against 47 bushels, when the same quantity of water was applied to one acre.

In another experiment, one acre of potatoes, receiving five acre inches of water, gave 154 bushels of potatoes. On another acre 30 inches of water were applied with a yield of 244 bushels. If these 30 inches of water had been spread over six acres of land, the yield from the water so used would have been 924 bushels, as against 244 bushels from the one acre, but with the same quantity of water.

As stated, the more water is used the smaller becomes the relative crop return. At least there comes a point at which there is an actual diminution of the yield. A vigorous stand of corn yielded 91 bushels of grain with five inches of water. The yield increased slowly until 25 inches had been applied, when it began to diminish, and with 40 inches of water only 90 bushels of grain were obtained—a little less than with five inches of water. This also is a law generally found to be true. The curse of the early days of irrigation in the West was overirrigation. None has dared to compute the loss in crop, alone, due to the application of water sufficient to hinder the growth of plants. The water logging of irrigated lands might measurably be overcome if every irrigation farmer were content to use reasonable quantities of water. In this matter again the irrigation farmer has a definite control over his crop. However, this is not the end of the story. As the application of water is varied, every part of the plant is affected. When little water is used, the proportion of roots is large. As more water is applied, the stems and leaves develop more rapidly. Increasing the water within definite limits lengthens out the plant; and in the case of the grains increases the number of seed bearing stalks from the seed. Even the shape of the leaves is determined by the quantity of water used. Corn leaves are narrow and pointed when produced with little water; wide and rounded when more water is added. Potato leaves are thick and long celled with little water; thin and short celled with much water. The color, stiffness and very shape of the plant may be changed by changing the quantity of irrigation water used throughout the season.

Of more direct interest is the fact that the relative proportion of leaves, stalks and other plant parts may be

controlled by irrigation, since seeds and fruit are usually more valuable than leaves, and leaves more valuable than stalks. Forage plants grown with little water are usually leafy, but the judicious application of water may increase the proportion of leaves. It seems possible by varying irrigation to produce, for instance, leafy or stalky alfalfa.

In cereal crops the seeds are of chief importance. It has been repeatedly demonstrated that the proportion of grain in the whole plant becomes smaller as more water is applied. In one set of experiments, wheat grown with five inches of water yielded 46 per cent of grain; when 25 inches of water were used the grain fell to 33 per cent. That is, water may be made to produce wheat or straw at the will of the farmer. The fruits are likewise affected by irrigation. By proper use of water the edible portion of cherries was increased five per cent; of plums ten per cent; of prunes and apples about two per cent, and the proportion of small potatoes was in one case reduced from one-fourth to one-tenth of the whole crop. Such results are far reaching once they become part of our agricultural practice.

The quality, that is the composition of irrigated crops, is remarkably sensitive to the quantity of water used. The proportion of the nitrogenous, that is, fleshforming, substances in any crop diminishes invariably as more water is used. By growing wheat with small quantities of water the seed produced has contained as high as 27 per cent of nitrogenous substances, or nearly twice as much as was obtained under irrigation. The grains, roots, tubers and fruit all obey this law. As the matter is more fully studied we may have here a powerful means of competition with the products of humid farms.

The other chief plant constituents also seem to be powerfully affected by irrigation. Crops containing much or little fat or sugar may be produced at the will of the irrigator. In the case of sugar beets, the water supply that will produce the sweetest beets is being well established. Cherries, peaches and prunes contain most sugar and least acids when receiving small irrigations. On the other hand, many other fruits appear to become sweeter under the influence of rather large irrigations. The color and flavor of fruit, the starchiness of potatoes, the woodiness of forage crops, the gluten in flour, and the cooking flavor of fruits, vegetables and other crops are affected strongly and definitely by variations in the quantity of the irrigation water used.

This is a most important matter which calls for careful and elaborate study from our agricultural investigators. If the irrigated regions can place crops of definite quality upon the markets of the world, we shall be able to command the best prices in competition with the products of the humid farms, and what is of more concern, we shall help make irrigation agriculture safer and more profitable.

Interesting experiments have recently been conducted that show quite clearly that varying the quantity of irrigation water renders the crop more or less susceptible to disease. For example, the percentage of bitter pit on Gano apples was seven with heavy irrigations and only about two with

light irrigations. If medium applications of water were made to August 1, and light ones thereafter, the crop was wholly free from bitter pit. This is quoted merely to show how intricate and complete is the response of the crop to the quantity of water used.

It is really remarkable also that the response does not merely depend on the total quantity of water used. The method of irrigation employed and the time of application change greatly the growth, development and quality of the crop.

#### MONTHLY WEATHER AND CROP REPORTS

By E. A. Beals, United States Department of Agriculture, Weather Bureau

**D**URING March abundant rain fell in all parts of the state. In Southern California the seasonal amount is nearly normal, and as much as that of a year ago, while in the San Joaquin Valley it is slightly over an inch above the normal and nearly three inches greater than that received up to the end of March last year. In the Sacramento Valley there is a decided shortage as compared with the normal and with last year. However, in this section the rains fell opportunely and gently which permitted them to soak well into the soil, therefore if the normal amount falls in April and May crops will not suffer seriously from lack of moisture. The snowfall in the mountains is considerably less than usual, and fears are entertained that there will be a shortage of water for late irrigation and power purposes.

Farmers were very busy during the entire month in plowing and seeding their land. A large acreage of barley and oats was sown in March, as well as some wheat. The early seeded grain has come up to a good stand, and the late sown is sprouting nicely. Some barley in the San Joaquin Valley is now in the boot and about ready to head, but in general wheat, barley and oats are not so far advanced in growth as is usual at this season of the year. In the interior valleys a few correspondents complain of the great amount of wild oats in the wheat sown last December; but it is not believed the damage from this cause will be of serious consequence.

In the north, pastures, ranges, meadows and alfalfa are in excellent condition, and stock in consequence is looking remarkably well. In the southern half of the state forage crops are rapidly improving and stock, although still thin, is taking on flesh and soon will be in good condition. The losses so far during the lambing season have been small, and the increase in the flock is normal, if not better than normal. The first cutting of alfalfa will begin next week and become general in about two weeks. Considerable land has been prepared for corn and beans, but very little of it has yet been planted. Extensive planting of truck crops and home gardens was done during the last half of the month and some sugar beets have been seeded. South of the Tehachapi the early planted sugar beets are ready to be thinned.

Almonds are past the blooming stage. This crop in a number of localities was severely injured by frosts on the 5th, 6th and 13th, while in other places it escaped serious harm. Apricots, cherries, peaches, pears, plums and prunes are in full bloom. Considerable damage has been done to deciduous fruit by thrips and horticulturists are now busy plowing vineyards, cultivating orchard and spray-

ing trees. Strawberries were badly injured by rain in the southern counties. Lemons are recovering from the setback they received from the hot weather last June. Oranges are making good advancement and Valencias of fine quality are being marketed.

#### GLENN COUNTY FARM BUREAU SCHEDULE FOR APRIL

April 15-16, Orland, night meeting, Tuesday, April 16.

April 18-19, Jacinto, night meeting, Friday, April 19.

April 22-23, Willows, night meeting, Tuesday, April 23.

April 25, Elk Creek, day meeting, Thursday, 2 P. M.

April 26, Plaza, night meeting, Friday, April 26.

All night meetings for the month will begin at 8 P. M., new daylight saving time. Programs for the month will refer to war production projects.

**Olive Trees**  
such as these are grown only on our foot-hill locations. — Note the good roots — for hardiness they have no equal.

We have a fine lot of Mission and Manzanillo trees, both on Picholine roots and grown from cuttings. We have had splendid success on all Olive plantings—a most important assurance to you.

Submit a list of your tree wants for special quotation. Do it right now.

We have also a complete assortment of Shipping Plums, Cherries, Prunes, Bartlett Pears, Fall Pears, Peaches, Almonds, Apricots, Walnuts, etc.

Our foot-hill grown trees are free from root diseases common to other localities. Our trees insure your future profits in fruit growing.

And remember—we will accept Liberty Bonds as full or part payment for trees. Write us today.

## See the CLEVELAND TRACTOR at the 1918 Tractor Demonstration

University  
Farm,  
Davis,  
California

April  
17-18-19,  
1918

Make your plans to attend this demonstration. The knowledge gained will be worth many times the expense. We invite you to study the

## Cleveland Tractor

see it operate under farm conditions, compare its price, weight, height, turning radius, ease of steering, packing of soil, how it works in mud, sand, hard or soft ground, in level fields or on hillsides. Compare the material, workmanship, dust-proofing devices, engine, governor, gears, clutch, roller bearings, clarifier, magneto and tracks. Compare every part of the CLEVELAND TRACTOR with all other tractors, then judge for yourself what is the best suited for your particular needs, and what is the greatest tractor value on the market.

**F. H. Stow, Cleveland Tractor Distributor**  
for Northern California and Western Nevada. Berkeley, California

## THE TRACTOR ENGINE

Continued from Page 458

## Ignition

The igniting point of different fuels varies, and accounts for the fact that gasoline may be compressed to higher pressure than distillate or kerosene, and alcohol higher than all three. In the Diesel type of engine pure air is compressed to 500 pounds pressure into which the fuel is sprayed. An igniter is not required.

## Temperature of Combustion

The temperature of combustion is very high in a gas engine. Twenty-nine hundred degrees Fahrenheit is not an unusual temperature. The significance of this is understood when it is suggested that the melting point of cast iron is about 2160 degrees Fahrenheit. If it were not for the fact that the gases of combustion are poor conductors, the gas engine would

be impractical due to lubrication difficulties in particular.

The term "cycle" when used in connection with a gas engine is a

complete set of operations or events which must take place in each cylinder of the engine.

Four stroke cycle: The four stroke

Oats and Barley Saved for Human Food

These mammoth tractors are saving thousands of tons of barley and oats and are enabling the farmer to produce more and cheaper.

cycle engine (or four cycle engine) is one which requires four strokes of the piston in the cylinder or two complete revolutions of the crank to complete the cycle. These four strokes effect the following events in the cycle:

1. Suction or admission of a mixture of fuel and air.
2. Compression of the mixture charge.
3. Combustion and expansion of the charge.
4. Exhaust or expulsion of the burned gases.

**Two Stroke Cycle:** In the two stroke engine a charge of air or mixture is given an initial compression sufficient to displace the burned gases in the combustion chamber near the end of the expansion stroke. The displacing charge of mixture is compressed in the following stroke of the piston and expanded after igniting on the next. Thus only two strokes of the piston are required to complete the cycle. The gases usually pass through openings known as "ports" in the side of cylinder opened and closed by the piston.

## Positions of the Piston

The extreme positions of the piston in the cylinder are usually referred to as the "head end" and "crank end" and dead centers.

## Combustion Chamber

The combustion chamber in a gas engine is the space within the cylinder, when the piston is in the position of crank end dead center, or in the position of greatest volume. For the sake of economy, it is desirable that the amount of surface in the combustion chamber to absorb heat should be as small as possible.

## Piston Displacement

Piston displacement is the volume of gases displaced during a full stroke of the piston. It is usually expressed in cubic inches and is used to calculate the capacity of the engine.

## Clearance

Clearance is the volume of the space remaining in the cylinder when the piston is in the position of head end dead center. Tractor engines usually have clearance amounting to one-quarter to one-third the volume of the combustion chamber.

## Principal Parts

Fuel tank; carburetor, to convert the liquid fuel into a spray and mix it with air; valve system to control the movement of the gases; ignition system to start combustion; cylinder and a piston to enclose the gases; crank and a connecting rod to utilize the force of the gases; flywheel mounted on crank shaft to give the engine a steady motion; governor to control the speed; pulley, gear, or clutch to transmit the power; oiling system to lubricate sliding parts; cooling system to keep the cylinder cool.

## Fundamental Definitions

A force is that which produces or tends to produce or retard motion. Usually measured in pounds.

Work is the product of force times distance. Usually measured in foot pounds.

Power is the rate of work usually measured in horse power. One horse power is equal to 33,000 foot pounds of work per minute.

The British Thermal Unit, B. T. U., is a unit of heat and is equal to 770 foot pounds of work. It is heat required to raise the temperature of one pound of water one degree by the Fahrenheit scale.

Buy another Liberty Bond.

## AT THE DAVIS DEMONSTRATION April 17-20 Inclusive

**A**T this mammoth and elaborate Educational Exhibition the ranchers of California will have the opportunity to witness the greatest tractor and agricultural implement demonstration ever held on the Pacific Coast.

EVERY TRACTORS in the following sizes will demonstrate their superiority in all classes of farm work: 5-10 H. P., 8-16 H. P., 12-25 H. P., 18-36 H. P., 25-50 H. P. and 40-80 H. P., plowing, disking, harrowing, subsoiling, checking, ditching, etc., also, the AVERY MOTOR PLANTER CULTIVATOR will be shown for the first time in public exhibition in the West. This motor implement plants and cultivates beans, beets, cotton, corn and all row crops.

AVERY BEAN AND RICE THRESHER will be in operation tent.

Pear growers of Napa County are now spraying for thrips.

Durham, Butte County, estimates a 60 per cent almond crop.

The valley will generally observe squirrel week April 29-May 4.

Sheepmen have contracted for all the range in Siskiyou reservation.

An \$8000 grain elevator will be erected at Williams, Colusa County.

Eldorado County fruit growers are using pine needles in orchard mulching.

Sutter County reports that her supply of raisins will be exhausted before the new crop comes in.

Lake County anticipates a fine pear crop. The growers have done more general spraying than for years.

Butte County is contemplating liberal response to request of the government to plant castor oil beans.

Yolo County wool producers are making the wool clip; but very few sales as buyers are slow in making offers.

The Eldorado County farm bureau is working for the keeping of pure bred swine on every ranch in the county.

The farm labor committee of the state council of defense is recommending severe measures with I. W. W. traitors.

"Every day squirrel day" in Yolo County. However, the week of April 29-May 4 will be a week when every squirrel will be invited to look for a health resort.

The Red Cross at Nicolaus managed a rabbit drive in which hundreds of rabbits were saved from destroying crops and \$200 was netted to the Red Cross organization.

Farm bureau meetings of Eldorado County: April 9, Eldorado; 10, Fairplay; 12, Penobscot; 15, Coloma; 17, Camino; 19, Gold Hill; 23, Kelsey; 25, Placerville; 26, Union.

The remount station at Camp Fremont, Menlo Park, is sending notices to farm advisers in near-by counties that it has thousands of tons of stable manure for disposal to farmers.

The Oroville mosquito abatement district is planning for a very thorough campaign during the summer of 1918. Much of the work will consist in permanent drainage systems.

Harry Stabler, former horticultural commissioner of Sutter County, has been made special labor commissioner and will endeavor to secure sufficient labor supply for farmers in that county.

Paul I. Dougherty, formerly assistant farm adviser of Napa County, and later of Imperial County, is now with the sharpshooter division of the intelligence department and has been transferred from Camp Lewis to a North Carolina camp.

The long standing dispute between water users and an irrigation company in Butte County has been settled by the state railway commission, which directs the company to file and put into effect the new rates within 20 days from March 25.

State Food Commissioner Merritt is taking a hand in settling the rice controversy which was brought about by Louisiana millers coming in and buying practically all the output—which the railroads were prevented from carrying to the Louisiana purchasers.

## Central California

Stanislaus County is shipping beans to Havana, Cuba.

Escalon, San Joaquin County, is appealing for a tomato cannery.

Tulare County farm bureau holds its fat hog auction this Friday.

Madera County farmers are endorsing the Madera County irrigation bureau.

A German has been arrested because of alleged cattle poisoning near Fresno.

The Grange Company proposes to build new bean cleaning and sacking plant at Ceres.

The San Jose Grange Patrons of Husbandry recently met and conferred degrees on a large class of candidates.

San Benito County reports its seasonal rainfall as nearly nine inches and so distributed as to assure a big grain crop.

The Tulare cannery had expected to make a strong run on artichokes,

## Southern California

Long Beach, Los Angeles County, is to install a mussel canning plant.

## The Coast and General

Sanford, Florida, recently shipped a solid trainload of celery.

Texas producers of spinach are making appeal for more cars.

Idaho will materially increase its sugar beet acreage this year.

Idaho producers are confronted with a shortage of 5000 freight cars.

Forest rangers in all the national forests are planting young trees.

The first cars of Bermuda onions out of Texas go forward this week.

Eastern Oregon reports live stock having wintered exceptionally well.

A potato marketing association has been organized at Satsop, Washington.

Dairymen at St. Helens, Oregon, are appealing for help from serious labor shortage.

Thousands of acres of alfalfa are being planted in Umatilla County, Oregon, this year.

Vegetable and truck farmers on the Eastern coast are suffering from severe basket and box shortage.

One Clarke County, Washington, lumber kiln-drying plant handles 10,000,000 feet of spruce monthly.

Eastern Washington farmers are making their spring drive on "log dragging" and grading of roads.

The superior court of Klamath Falls has issued an order establishing the Willow Valley Irrigation District.

The Conservator of Forests of the Imperial forest service of India is investigating American forestry conditions.

The Boise Valley Sheep Breeders' Association has been formed in Idaho. The president is S. E. Sebrén of Meridian.

The potato producing sections near Seattle, Washington, report light demand for seed and less planting than anticipated.

Western Washington farmers have purchased more tractors for this season's work than were owned in that section before.

The Utah-Idaho Sugar Company will plant 500 acres in sugar beets as an experimental plot in Walla Walla Valley, Washington.

The flour mill at Ashland, Oregon, has made changes in its machinery which enable a great increase in its production of flour substitutes.

The contention between sheepmen and cattlemen of Arizona regarding pasturage in the Indian reservations has been settled by compromise.

The Cache Valley beet growers competed for a series of prizes offered by the Amalgamated Sugar Company for Utah grown beets. There were five \$100 prizes and many others ranging from \$25 to \$75.

Arizona water users are protesting against the decision of Secretary of the Interior Lane in the matter of water division between the Imperial Valley and Arizona points. The arrangement will limit Yuma needs to 120,000 inches, or one-fourth the water available at Laguna dam.

Utah beet sugar manufacturers, at the personal request of Food Administrator Hoover, have agreed to pay beet growers \$10 per ton. This is a flat rate, or growers are given option of \$9.00 price on a profit sharing basis. The growers are cooperating and have promised to go the limit.

## Have You Bought Your Third Liberty Bond?

Agricultural News Notes gives its usual page over to Liberty Loan Bonds this issue. It is good reading. See page 467.

but finds it has not sufficient stock to make a successful season's run.

The Oakdale irrigation district has "taken stock" and finds its properties valued at \$2,607,\$10. The cost of operation exceeds \$60,000 annually.

Members of Lincoln Grange were recently hosts to the Pomona Grange of Stanislaus County. Prof. Horne made address regarding brown rot of fruit.

Merced County's rabbit drive netted 18,000, which it has figured will make a saving of over \$36,000 worth of food. At \$2.00 destruction each, rabbits are high priced.

Tulare County is giving very thorough investigation to the labor situation, and its farmers are answering questionnaire sent out by the Valley Fruit Growers' Association.

Secretary Miot of the Tulare County board of trade is negotiating for farm help and thinks he can land from 500 to 1500 desirable working people in the county if the farmers wish them.

The Pajaro Valley, Santa Cruz County, anticipates the early construction of a potato drying plant which will enable that county to send thousands of tons of dried potatoes to our armies in France.

There is contention between the national park control and the forest reserve people regarding the uniting of Sequoia Park with General Grant Park. Many people of the San Joaquin Valley are combating the change.

A fruit dryer of the Pajaro Valley at Watsonville is contemplating changes in his dryer which will enable him to dehydrate potatoes. Effort is now being made to secure government contract which will insure the project.

side County, spent the Easter vacation in their large war garden.

The draft quota for Imperial County has been greatly reduced because of the great percentage of Mexicans, Japanese and Hindus, not citizens.

The latest union is the American Fruit Workers' Association. It is negotiating with the Imperial Valley cantaloupe growers to supply labor.

It is reported that the beet sugar factory at Chino, San Bernardino County will not run this season, presumably because of beet production shortage.

A branch of the Indio state farm, or experiment station, is to be established at Palm Springs, Riverside County. It will be in charge of Prof. S. C. Mason.

The San Diego County farm bureau is protesting against the law which provides a closed season for all kinds of rabbits and the exaction of a license fee for shooting them.

Imperial Valley grain growers are holding mass meetings and discussing methods of handling grain in the face of the fact that they are unable to secure grain sacks in sufficient quantity.

The Pacific branch of the National Association of Economic Entomologists was held in Southern California at two points, one day session at Riverside and another at the state insectary, Alhambra.

Beet growers at Oxnard, Ventura County, are dissatisfied with the \$8.25 base price on beets, this because it is conditional on the price of sugar, some maintaining they prefer the \$7.50 price without strings.

# 150,000 Farmers Quit "Guessing" When They Paid Our Dealers \$10,000,000 for "Z" FARM ENGINES

## 150,000 Farmers Chose These "Z" Engine FEATURES:

1. Fairbanks-Morse QUALITY.
2. Economical in first and fuel cost, and low up-keep.
3. Simplicity and staunch durability.
4. Light weight, substantial, fool proof.
5. Gun Barrel Cylinder Bore.
6. Leak-proof Compression.
7. Complete with Built-in Magneto.
8. More than Rated Power.

## "Z" 3 & 6 H. P. ENGINE Uses Economical KEROSENE Also Distillate, Coal Oil Tops or Gasoline

Kerosene, easy to get, at half gasoline costs, does the work in a "Z" with more than rated power. FAIRBANKS-MORSE engine designers saw this war-demand coming and built "Z" Engines to fit the farmers' needs. The farmers know it now—over 150,000 strong. Will you too investigate? Compare. Figure out the FACTS—before you buy ANY Engine. *Alright—we know the result, because—*

### You Also Get This Local Dealer Service

Go to the Fairbanks-Morse Dealer. He is in position to render you prompt and personal service. He has exactly the "Z" for your NEEDS in stock and can make quick delivery. See it in operation on his floor.

## Insect Enemies of the Home Vegetable Garden

By F. H. Chittenden, Truck Crop Investigations, U. S. D. A.

CERTAIN species of ants may be found afield from March to October and often occur in greenhouses and coldframes, attacking cabbage and related plants, egg plant, lettuce, beans, parsley, radishes, tomatoes and peppers. They attack the roots, crown and lower portions of the stem, and completely destroy young plants.

Control. The best remedy is fumigating the nests with carbon disulphid by means of a machine oil can made of metal. Locate the nest and, if possible, the female, or queen. Inject about two or three teaspoons of the liquid into the entrance to the nest, and if not effective soon repeat the dose a little stronger. Hot water will answer the purpose if the insects are not too abundant. Poisoned baits as for cutworms have been used with good effect. Careful watch should be kept for the appearance of these insects in lawns and elsewhere about the grounds and the nests destroyed. Consult Farmers' Bulletin 740 on "House Ants."

### Onion Thrips

The onion thrips, incorrectly called "thrip," is microscopic in size and is often called the onion louse. It causes an injury somewhat generally known as white blast, white blight, and silver top. It also causes scullions, or thick necks—poorly developed and unmarketable bulbs. This species frequently ruins entire fields of onions. Besides the truck crops mentioned this thrips attacks cauliflower, cabbages, cucumbers, melons, pumpkins, squashes, parsley, tomatoes, kale, turnips and seed beets. It is what is known as a general feeder, and it would be easier to mention plants which it does not attack than to list those which it uses as food.

Control. Nicotine sulphate, 1-1000 and soap is used with success.

### Tarnished Plant-Bug

Nearly all vegetables are attacked by the tarnished plant-bug, a small leaf-bug measuring about one-fifth of an inch in length when mature. There are five distinct stages, called "nymphs," from the time the egg is laid until the adult or winged form appears. This species is injurious to cabbages, turnips, potatoes and cucumbers, and injury generally is done by the adults piercing and sucking the juices from the plants and later attacking fruits and shoots. It is the cause of "buttoning," and is credited with carrying some forms of blight on plants. Were it not that this insect feeds on so great a variety of plants, thus distributing its attacks, it would be a serious pest indeed.

Control. This plant-bug, when it occurs in great numbers, can not be kept within bounds by any single remedy. The great activity of the pest makes it particularly difficult to control. The best remedies are nicotine sulphate, kerosene-soap emulsion and fish-oil soap. As in the case of plant-lice, insecticides must be applied in the morning before the insects have become thoroughly active and while dew is on the plants. In the small garden, sweeping all the plants, grasses and weeds with an insect-collecting net will accomplish much toward keeping the pest in subjection.

### Red Spider

Practically all vegetables are sub-

ject to attack by the red spider. It is not a true spider but a mite, the latter name being indicative of its minute size. It is well distributed throughout the country. Among vegetables and truck crops most attacked are beans of all kinds, cowpeas, egg plant, cucumbers, tomatoes, melons, squashes, strawberries, raspberries, beets and celery. It is also a greenhouse pest and does great damage to cucumbers and tomatoes, as well as to ornamental plants grown under glass. It is a general feeder in the broadest sense, infesting the foliage of shade and fruit trees and some field crops. It is often present on the under surface of leaves like beans without being suspected. This mite injures plants by sucking the juices, and when plants are neglected their vitality is slowly reduced by loss of sap, and in time all of the plant's functions are deranged. In case of severe attack, millions of red spiders can be found on the foliage, and the webs which the insect spins from plant to plant can be easily seen, with the mites themselves passing rapidly over them and congregating in swarms. Sometimes the plants look as though stricken by fire.

Control. The remedies are spraying with soap solutions, kerosene-soap emulsion, and sulphur preparations. Flowers of sulphur mixed with water at the rate of one ounce to one gallon sprayed over infested plants is of great benefit. Unless remedial measures are adopted early and applied as often as necessity demands, red spiders are almost certain to do great harm to delicate plants, since if the plants become thoroughly infested they seldom survive. Frequent spraying with soap and water will often keep the pests in check, especially in greenhouses.

### Slugs and Snails

Much harm is done by slugs, little animals sometimes classified as insects, but really mollusks. They are not provided with shells, while snails are shell bearers. The latter are also sometimes troublesome, but their injury is limited. Attack is most severe on delicate seedlings grown in hotbeds and in coldframes. Delicate garden vegetables of nearly all kinds also are injured by them in the open, attack beginning when the plants are near the ground and even after the crop is ripening. Potatoes are bored into and celery is often badly injured during the bleaching process.

Control. The best remedy is a preventive and consists of lime in any form, quicklime being the most useful, sprinkled over the plants and scattered about the haunts of the slugs, which means all about the garden, buildings, outhouses and fences. When the lime comes into contact with the slug, the latter secretes slime copiously and in time this completely exhausts the animal and it dies.

Other remedies are soot, dust, sifted wood ashes and kainit. By scattering a line of any of these substances around a garden, coldframe or other inclosure, it will serve to keep the slugs away. To avoid slugs it is desirable to remove all rotten wood and old structures and to keep the entire garden and yard free from rubbish of all kinds.

### Springtails

Springtails are minute, dark-colored, soft-bodied insects which hop like fleas. They have the same habit as flea-beetles of pitting the first-appearing leaves of all kinds of seedlings, which causes much disfigurement and reduces the yield of the crop.

Control. The control is the same as for flea-beetles: Bordeaux mixture combined with lead arsenate or Paris green.

## Eastern Vegetable Shipments

HERE are few producers of farm products who have not been confronted by almost insurmountable obstacles in the matter of shipments, especially of perishable products. California vegetable producers have felt that they had rather more than their share. The situation became so strenuous that some step was necessary, and a few weeks ago the California Vegetable Growers' Committee was formed and issued a statement to Director General McAdoo, from which we quote:

"We, and those we represent, are growers of fresh vegetables, farming throughout the state of California about 75,000 acres. The crops raised by us are artichokes, asparagus, cucumbers, celery, cauliflower, cabbage, cantaloupes, lettuce, peas, rhubarb and tomatoes; and the total Eastern shipments of these products approximate 25,000 cars annually, about 75 per cent of which is distributed east of the Mississippi River, although all sections of the United States draw their supplies of fresh vegetables during some period of the year from California as it is the chief, and, in many instances, the only source of supply available.

"Prior to this season the service rendered by carriers has, as a rule, made it practical to deliver our products in all markets, even to Atlantic coast points, in good condition, but for several months past, on account of delays in transit, our vegetables have arrived at destination in bad

and, in many cases, worthless condition, and have sold for very low prices and in many cases for less than transportation charges, causing not only loss to us but what in many respects is a greater loss, namely: The absolute waste of valuable and necessary food products. This condition can only be corrected by putting in effect immediately a reasonable transportation schedule for the handling of our fresh vegetables, and we suggest as a maximum the following, namely, nine days to Chicago, 14 days to New York, 15 days to Boston and a schedule to intermediate points between Chicago and New York to correspond to the above."

Other transportation problems and the urgency of immediate decision were referred to in the statement, which was taken to Washington by Mr. O'Neil, one of the members of the committee. He has wired the home members of his committee:

"At conference with Traffic Director Chambers last night he promised resume definite schedule east of Chicago on perishables and to advise me today schedule to principal points in that territory such as Pittsburg, Philadelphia, New York, Boston, and full detailed schedule when worked out between him and regional director."

Other wires have followed from Mr. O'Neil in effect that schedules are being arranged and shipments of California vegetables are going forward with assurance of every possible aid from the railway administration.

## Garden Cutworms: How to Destroy Them

By H. J. Ryan, Bureau of Entomology,

U. S. Department of Agriculture

CUTWORMS are usually the first of our insect pests to attack the truck and vegetable garden after the plants appear above ground and are chiefly conspicuous by the results of their work. They are mostly concerned with young succulent plants, and the grower finds in the morning that the stem of a plant has been eaten into near the ground, or the entire plant has been lopped off and only a stub a half inch or so in length remains protruding from the soil. Tomatoes are often destroyed in this manner. Cabbages and lettuce are also favorite food plants of these pests; indeed, practically all early vegetables and truck plants are subject to injury.

If the interested gardener will dig an inch or so into the loose soil about the base of the injured plant, he will probably find a curled-up, dark-colored, fat, sleek, "worm," from half an inch to an inch in length.

Summary treatment is obligatory if one would circumvent activities so unquestionably hostile. A thief who works only at night, the cutworm's life history dates from an egg laid by a small gray or brown moth about an inch across the expanded wings and who also shuns the sunlight.

### How to Fight Cutworms

Cutworms find protection during the day under trash and garden refuse as well as in the soil. We may take advantage of this habit by placing pieces of boards between the rows. Many of the worms will crawl under these in the morning and can be found there during the day.

Some good may be accomplished, on a small scale, by digging the worms out and crushing them. It is also possible to find some at night by the aid of a lantern, but such methods are not practicable, and merely makeshifts at control.

### Poison Bait Remedy

The best remedy, and one which can be used successfully on either a large or small scale, is poison bran bait. For use in small garden two quarts of bran should be thoroughly mixed with two teaspoons of white arsenic. To this is added a pint of cheap molasses stirred into one-half gallon of water. The mixture should be made up to the consistency of a stiff dough and allowed to stand for several hours to enable the poison to soak into all the bran particles.

The bait should be scattered over the garden, especially at the edges, and about the base of the plants in lumps about the size of a marble. If distributed late in the day it will remain fresh and tempting to the worms when they commence their activities.

For large areas the following formula is efficient: 20 pounds of bran, one-half pound of white arsenic, one-half gallon of molasses and enough water to make the dough. This should be sufficient for four or five acres. It is sometimes necessary to repeat the application. The addition of fruit is unnecessary.

Short circuit on corn bread, the wheat won't go around.

A good citizen is known by the food he eats.

## Note What It Does

## "Right-About-Face" With FULL POWER

### Remarkable Performance with Small Tractor

BEFORE you write out your check for any tractor, note how the Bean TrackPULL turns right around into the same row with tools down deep all the way, without pivoting, or overloading one side of the tractor, or doing anything else that is injurious, or difficult, or that a tractor shouldn't do. Note how this tractor takes its turn with

its full load, just as easily as it takes the same load down the straight-away. Note the reason for this in this tractor's single track which it pulls and you steer. See how easy it is to steer, and how that great PATENTED SINGLE TRACK FEATURE also makes the TrackPULL Tractor as flexible as the best team you ever had.

### "Almost Like Animal Intelligence"

"Mine acts like it understood—almost animal intelligence," is the way one man puts it—and you'll want that, too, in a tractor. For ease of handling, as well as the ability to make right-about-face turns with full power, has got to be in the tractor you use in an orchard or vineyard or in the field, where there's a lot more than just straight-away work to do.

Be careful about "acrobat" tractors—for tractors that will spin around at a fair aren't necessary

ily tractors that will turn short with a full load in the field. Make them demonstrate to you with their tools hitched on.

Send right now for the Bean TrackPULL catalog, learn the price of this great machine, and get the name of the nearest factory-agent who will demonstrate how the Bean TrackPULL Tractor does the kind of work that's waiting for it on your place.

Mail us this coupon, now before you forget it. Find out the truth about tractors right now!

## OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscribers must have mentioned the Cultivator when writing the advertiser.

## THIS WEEK'S COVER

The center photograph shown on this week's cover will remind several hundreds of the Cultivator's subscribers of an annual event which is becoming one of the most popular of all held in California. It is the Farmers Picnic at the University Farm or, rather, it is one little sideline manifestation, for it shows only a small section of the parking grounds. This picnic has been held for seven years at the University Farm, and each year the attendance is greatly increased. This year's attendance will doubtless exceed all former records, for the event is to be preceded by three days of tractor demonstrations, and the tractors will all remain and participate in the picnic, especially the grand parade. The upper and lower portions of the cover engraving are from the poster announcing the demonstration which is conducted by the California Tractor and Implement Association.

The day has been one in which pleasure is mingled with profit, for some of the best speakers of the country have been called upon to give inspiration to the visitors who make this annual pilgrimage. This year's talent will be augmented by a great number of practical tractioneers who will be there with their machines to show how they can save labor and possibly save the country in our campaign for the production of more food.

More tractors have been manufactured and sold during the past 12 months than in any other like period in the history of the country. We believe another year will show even greater interest.

Bought your Liberty Bond?

## LIBERTY LOAN

The first Liberty Loan under bond act of May 24, 1917, was for \$2,000,000,000 at 3½ per cent. The bonds bear interest from June 15, 1917. More than 4,000,000 people subscribed.

The second Liberty Loan bore four per cent and was for a minimum of \$3,000,000,000 and a maximum of \$5,000,000,000. Its minimum was over subscribed 54 per cent. It bore interest from November 15, 1917.

## \$10 BEETS

Utah farmers are planting sugar beet seed. They have been given a \$10 per ton price, that is, provided the acreage is increased at least ten per cent over that of last year and also provided certain prices for sugar prevail at the time of harvest. Or they are offered by the mills a guaranteed \$9.00 basis regardless of tonnage or sugar prices. The beet growers and their friends are conducting a campaign to secure the desired ten per cent increase.

## CAMP FIRES

The forest service of California announces that it will require permits of all campers who expect to go into portions of many of the national forests. This requirement has in the past been confined to the Angeles

was the case a few years ago. Hence an efficient tractor, with tools built to do the work, gives opportunity to aid in food production as never before.

Proof of their worth has been shown by increased crops in many sections of this state. Tractor demonstrations afford opportunity to the manufacturer and his sales force to demonstrate methods of doing, but the farmer who has done and produced crops gives vastly stronger proof of the real value of the tractor.

## KILL THE PESTS

Many a farmer is writing to the Cultivator asking if there is not some relief from the pest of rabbits which are destroying crops all over the state. The game law as it now stands, protecting the rabbits, is resulting in a vastly lowered production of food-stuffs. There is not sufficient latitude given by the fish and game commission to allow farmers to protect their crops. The farmers should unite and demand of the next legislature relief from this intolerable and foolish situation.

## TRACTOR PAPER

The federal reserve banks have announced that they will rediscount notes which are secured by farm tractors. This is another step toward cheaper money for the farmer. It is

## THIRD LIBERTY LOAN

The campaign will run from April 6 to May 4. Initial payment May 9, five per cent; second payment May 28, 20 per cent; third payment July 18, 35 per cent; fourth payment August 15, 40 per cent.

Third Liberty Loan bonds are ten year gold bonds, payable 1928, bearing interest at 4½ per cent. Interest dates from May 9, 1918. Application must be accompanied by a payment of five per cent of the amount of bonds applied for or by payment in full. Bonds will be in denominations of \$50, \$100, \$500, \$1000, \$10,000 and \$50,000.

Although the loan is for \$3,000,000,000, it is the opinion of all financial experts that the United States will need at once \$5,000,000,000 and will so announce before the loan is well under way. This means that we must do more than meet our quota; that we must be prepared to go over the \$5,000,000,000 mark.

forest, but because of the large per cent of fires resulting from this cause in 1917, it was found necessary to extend this requirement. The record for 1918 may determine very largely whether or not the camp fire permit will be extended to the Sierra and Northern California regions.

No greater privilege is given to Californians than this of the freedom of our wonderful mountains. It is to be hoped that every camper will not only watch his own step but will play the part of a vigilante and at least inform the proper authorities when carelessness permits other campers to jeopardize not only the pleasure but the best interests of all in the state.

## EFFICIENCY

A whole sermon on tillage is preached by the photograph of the tractor digging up "the farm under the farm" on Page 458. We are fully aware that the production of a successful, and especially a profitable, crop requires vastly more than the plow which will go deep into the earth, pulled by a tractor powerful enough to negotiate any difficult job of plowing, that is, there are a thousand and one other questions of physical and chemical conditions of the soil, of fining the surface or possibly of sub-surface packing, and almost innumerable other questions, but the depth of California soils and the real value underlying their surface is appreciated by more people than

coming slowly, and many of our subscribers have complained because of refusal of the federal farm loan bank to advance loans as freely as the land owners have desired, but the borrower must bear in mind that this is a big question, and the farm loan movement is feeling its way. It must be kept within conservative and safe bounds. This is only justice to those who advance their money on these bonds of the federal farm loan banks, and it is good policy in the securing of permanency to the movement.

Now with the money which has been given by many farmers to cover tractor purchases, accepted by the federal reserve banks, it is presumed the manufacturers will be enabled to extend their operations materially and to give a lower rate of interest and to aid the country in producing more.

The instructions which have been issued by the federal reserve board to the banks authorize them to redeem this tractor paper provided its maturity does not exceed six months and the tractors are purchased for agricultural purposes. We wish the time were extended, but like other steps taken, "Safety First" is the motto.

## This Week's War News

A British torpedo boat destroyer has been lost by accidental collision during the week.

English troops are being transferred to Italy to reinforce troops there in anticipation of an Austrian drive in the near future.

Turks claim a victory over the British on the east bank of the Jordan, which victory the British assert is purely imaginary.

A vigilance committee at Collinsville, Illinois, took a German sympha-

thizer from jail and hanged him to a near-by telegraph pole.

Lenroot, loyalist Republican, has been elected United States senator from Wisconsin. Davies, also loyalist, likewise received strong vote over Berger, Socialist.

The Bethlehem Steel Company plant near Baltimore suffered from a terrific explosion on the night of April 8. No explanation is made, but we may assume it to have been caused by incendiaries.

The French are inquiring into the long delay in the execution of Bolo Pasha. As a rule, however, it is thought that the military authorities expect developments which may prove of value in ferreting out other traitors.

The situation in Finland is still one of anarchy. German troops are marching in and Swedish residents are uniting with the "White Guard" in support of the Germans. Russian reinforcements are also entering the country and aiding the loyal Finns.

The "72 mile gun" which Germans are using on Paris is discussed by its believers and scoffers. However, one claim is made that seismographs the world over distinctly make record of each discharge of the gun. In any case, thousands of residents of Paris have moved from the city.

April 6, the first anniversary of America's declaration of war and the initial day of the third liberty loan drive, was observed the country over with booming of guns and fluttering flags and "bombardment" by airplanes dropping circulars advertising the third liberty loan. Extended military parades were also held in nearly every city.

Another step in the Russian-German "peace negotiations" has been taken in the appointment of Adolph Joffe, who was chairman of the Russian peace delegation, to be ambassador to Berlin. The "government" at Moscow is reported to have ordered the sale of the Baltic war fleet to Russian firms or citizens who will change them over into merchant vessels. American, English and Japanese troops have been landed from warships in Vladivostok.

President Wilson made an address in Baltimore, April 6, in which he expressed willingness to discuss peace "when our enemies are willing to discuss peace with honesty of purpose," but as to the challenge of the Central Powers, "There is, therefore, but one response possible for us: Force, force to the utmost, force without stint or limit, the righteous and triumphant force which shall make right the law of the world, and cast every selfish dominion down in the dust."

The condition in France has again assumed the appearance of a deadlock. The battle line is little changed during the past week. Artillery action is almost incessant, and occasional charges on the part of the Allies have deprived the Teutons of some of their ground. The greater activity now is in the extreme north toward the sea. At this writing British and Portuguese troops are yielding slightly near Givenchy. United States forces are known to be on the Picardy battle line, but as to the extent of participation or the casualties no report is made. Amiens and the railway lines between it and Paris are still safe.

In discussing the man power bill in the house of commons Prime Minister David Lloyd-George made address reviewing the military situation and the problem which confronts the Allies. While not exactly pessimistic, the prime minister sounded a note of warning to the people of England and of America. He was free in expressing his disappointment that America is waiting to complete its various divisional organizations and to have its men in perfect training before sending them to the field of battle. The British fighting line is now being reinforced by boys of 18 and 19 years and the man power bill is contemplating raising the age limit to 50 or 55 years. In the minister's speech he referred to the fact that he and Mr. Balfour and Premier Clemenceau had submitted proposals to President Wilson to bring the United States forces into the battle line with other troops so long as they were unable to take definite part in the action as an American army. Meanwhile Ireland still refuses conscription.

# Uncle Sam Wants to Borrow Your Money!

**M**ONEY that through your liberty he made possible for you to earn. There is no other security in the world so valuable as a Liberty Loan Bond.

You may have bought a First Liberty Loan Bond. And you may have bought a Second Liberty Loan Bond. And you may have foregone some pleasures or comforts in buying either or both.

But you *must* buy a Third Liberty Loan Bond.

This is more than a duty. It is your country's call at a time when *more money* is needed to win the war.

The vast sums already raised and expended were but stepping stones. Now comes the Third call and you must respond generously—with sacrifice, if necessary.

Let us finish it now—as a whole nation unified in lending. It is the only way to win, and win we must. Buy that Liberty Bond *today*!

*This page is donated by the following Patriotic San Francisco Firms who realize the necessity of Success of the Third Liberty Loan:*

Genuine  
Giant Powder  
bears *this* trademark

**GIANT FARM POWDERS**  
STUMPING — AGRICULTURAL

The Giant trademark is worth looking for, because it spells better blasting and more of it—done at lower cost. "Giant is powerful, nice to handle," writes Clarence Warner, Dayton, Ore., "and takes less powder to do the same work than other brands. I think Giant is just O. K."

Giant Farm Powders—Eureka Stumping and Giant Stumping—are made especially for western farm use. Every ounce of energy has exactly the right cracking, splitting and heaving action. More than half a century of such efficiency has made them so popular that other explosives are in error called "giant powders."

This indicates the superiority of the original. There is only one brand of Giant Powders. The Giant trademark is your sure protection against imitations.

The coupon (or a postal mentioning this paper) will bring you the big free book "Better Farming." It tells you how to do many kinds of farm work cheaper and better.

### Perforated Tree Protectors

Why use anything but a PERFORATED PROTECTOR, which allows free circulation of air and sunshine to gradually harden the tender bark. Practically a small LATH HOUSE ABOUT EACH TREE. Protects from Squirrels—Rabbits—Gophers—Hot Sun—Sand Storms—Barking in Cultivation, etc.

We make a number of kinds. TELL US YOUR PEST, and we will tell you what kind to buy. Get our prices. We can save you money.

#### COLLAPSIBLE PLANTING POTS

Why not raise your early Tomatoes, cabbage, chili and egg plant for home use or for market. Do you know that you can start

Cucumbers, cantaloupes, melons of all kinds in these pots in flats until they have three and four leaves then plant pot and all, have melons two or three weeks earlier for market. Just the thing for Propagating Eucalyptus and Olive cuttings.

Write for samples and prices of both Pots and Protectors. State which you are interested in. THE EXPAN CO., 935 E. Central Ave., Redlands, Cal.

Better service is assured by the advertiser if when writing you mention the California Cultivator.

## New Irrigation District

Written for California Cultivator By Martha L. Baker

The first unit of the big Terra Bella district irrigation project in southern Tulare County has been completed and water from it is now being used. This irrigation system, which is the first of its kind to be built on so large a scale in this state, serves approximately 12,000 acres. The district was organized August 16, 1915, by resolution of the board of

property line and installs the meter free of charge, with a small charge for additional meters. The water is measured in pressure and gravity meters, the plan being to serve each individual property owner in units of ten acres. The water is measured in acre feet in the irrigation meters and in cubic feet in the domestic meters. The cost of the water cannot be defi-

Ditcher at Work on Terra Bella Lands

Tulare County soils are producing wonderful crops when water is carried to them.

supervisors of Tulare County, being one of the several new districts to be organized under the amended irrigation act of 1897. The district is funded by an authorized bond issue of \$1,000,000, of which \$600,000 has been sold.

Ten valley wells, all of which test 100 miner's inches or more, and one testing 177 miner's inches, three creek wells and an infiltration gallery, all of which have been tested out, furnish the water for the system. The water is delivered in a system of steel pipe lines to all parts of the district

nitely determined until the end of the irrigating season but the law provides the water shall be delivered to the property owners at cost. Six dollars and eighty cents an acre foot has been named as an approximate estimate of the cost of the water.

This big irrigation project is going to mean that hundreds of acres of now barren land in this part of the state can and will be placed under cultivation. The district under the system comprises some very fertile land lying at the base of the foothills of the Sierra Nevada and extending

Some of Terra Bella's Wealth Giving Water

—Engravings used by Courtesy of Terra Bella News.

and so is suitable for domestic as well as irrigation purposes. The system is operated entirely by electricity, with five zones, served by boosting stations augmented by reservoirs.

The district pipes the water to the

several miles west onto the plains. Part of the land in the district is especially adapted for the culture of oranges, lemons, olives, also deciduous fruits of numerous variety. The elevation of the land runs from 462 to 811 feet above sea level.

## Toxic Substance in Cotton Seed

At one time the Cultivator contained articles regarding the poisonous nature of cotton seed meal when fed to hogs continuously. Pork producers have usually fed sparingly, if at all, but it now appears that not only may it be treated so as to be fed to hogs but it is becoming a factor of value as human food.

The Agricultural News of Barbados comments:

The results of investigations into this toxic property by Messrs. W. A. Withers and Frank E. Carruth, of the chemical division, North Carolina experiment station, are recorded in a paper contributed by them to the Journal of Agricultural Research,

January, 1918. Previous work on this subject by these two scientists was recorded in the same journal.

They find that the toxic property of cottonseed meal is due to an active principle, which they name gossypol, and which is present in raw cottonseed kernels to the extent of about 0.6 per cent. Gossypol is readily soluble in acetone and ether, and moderately soluble in ethylic alcohol. The extraction of the gossypol by ether rendered the remainder of cotton seeds non-toxic when fed to pigs, whereas the ether extract containing about two per cent gossypol was highly poisonous.

It was found that cottonseed meal was much less poisonous than raw cotton seed, owing mainly, in their opinion, to the oxidation of gossypol by the cooking during the process of manufacture.

The experimenters conclude that the toxicity of cottonseed meal varies with the conditions of cooking the raw seed. Even after cooking for 28 minutes there was still left in cottonseed kernels 0.07 per cent of gossypol, as compared with the original 0.6 per cent. They are of opinion that thoroughly cooked cottonseed flour and meal have no apparent toxicity for rats, when supplemented by milk powder in the diet, although inferior in nutritive value to cottonseed kernels from which the gossypol has been extracted by ether.

It would seem, therefore, that it is possible, probably by a combination of extraction and cooking, to obtain a valuable foodstuff for human consumption from cotton seed, if also the seed is subjected to decortication for the purpose of removing the hard outer skin. Some such process is probably employed in the production of cottonseed flour in Texas, where, it is said, it is increasingly being employed in bread making. An extension of such manufacture in all cotton-growing countries would materially add to food resources, if after further trials the resulting flour can be depended on as free from the toxic property which has hitherto prevented its use as a food.

#### RAISING CALENDULA FLOWERS FOR MEDICINAL PURPOSES

Written for California Cultivator

One of the most common drug or medicinal plants in California, for which quite a demand has recently developed, due to stoppage of imports, is the calendula. The leaves or petals are the part used. They must be dark orange in color, clean, free from green leaves or stamens, and perfectly dry. The plants are hardy, of rapid growth and full of bloom practically the year around. Seed can be sown in beds one inch deep and transplanted into rows for cultivation, rows to be three feet apart and plants 15 to 18 inches apart in rows. As they bloom continuously they require plenty of fertilizer and water and frequent cultivation. Plants will begin to bloom 90 to 100 days from seed. They require picking weekly or as fast as the blossoms are fully developed. Pick without stems and place in shallow trays until partly dry. Then pull off the leaves and dry thoroughly, sift and put into clean flour or sugar sacks, ship by express or parcel post.

Prince of Orange is recommended as one of the best varieties. One-tenth of an acre makes a good trial planting and one-fourth to one-half pound of seed should bring plants enough to set it.

Ask no rest; we have a victory to win.

#### WOES OF THE FARMER

A Ventura subscriber writes of some of the woes of the farmer, and from the showing which he makes in the letter quoted below he has had his war time experiences. The worst of it is he is not the only one this year to whom things have looked serious and, as yet, still have anything

but a rosy hue. However, strictly from the farmers' standpoint the recent rains have given a little tinge of green which has, if not rosy, a look which means prosperity. The farmer writes:

"September ranch burned over by brush fire, some cattle burned. Dry weather until February 15, cattle dy-

ing for want of feed. Then 13 inches of rain, killing the weak cattle. Feeding for 15 days with hay, at \$35 per ton. Then a heavy rain making the hills slide, miring the stock. On March 8 some disease on account of low vitality of stock, loss 30 per cent. Where do we get off?"

#### FARM BUREAU DIRECTORS MEETINGS IN SACRAMENTO VALLEY

The directors' meetings for the month in the Sacramento Valley district are as follows: April 15, Colusa County, Colusa; April 16, Sutter County, Yuba City; April 17, Butte County, Oroville; April 18, Shasta County, Redding; April 19, Tehama County, Red Bluff; April 20, Glenn County, Willows.

Save energy by doing farm work with a gasoline engine whenever it is possible. A good engine will perform any work to which it is adapted much cheaper than it can be done by hand or frequently by horse power.

"There is no half-way house between victory and defeat." — Lloyd George.

Nothing is as usual; why eat as usual?

Storing Wealth in Tulare County

—Courtesy Terra Bella News.

## The Second Line of Defense

Behind our Army and Navy is our second line of defense—the farms of this country—which must provide the food necessary at home and abroad. The "Caterpillar" Tractor's important share in this work is to cultivate and harvest the crops more cheaply and more efficiently, to economize in man power, to increase production.

Because it will stand up to continuous, severe service, because its cost for operation and upkeep is low, because it will work under any and all conditions, the "Caterpillar" Tractor stands supreme. Holt manufacturing experience of more than three decades and Holt high standards of design, materials and construction have established and maintained this supremacy.

What the "Caterpillar" Tractor has done for others in reducing costs and increasing profits it can also do for you. Write today for complete "Caterpillar" Tractor information.

# CATERPILLAR

## THE GREATEST DAIRY COW IN CALIFORNIA

is a title that may well be claimed by MISS VALLEY MEAD DE KOL WALKER, who has added to her many accomplishments the winning of the California Dairy Competition over all breeds, with an actual production of 819.42 pounds butter fat in 10 months, and giving her a total credit of 966.9 pounds butterfat with age handicap as she is only a junior three year old. Keep your eye on her son

### King Korndyke Pontiac 20th

our junior herd sire, for whom we paid \$6500 in the Guaranty Sale. You will want to buy one of his sons one of these days, and in the meantime visit our herd whenever convenient and see the great

cows and heifers with which he is being mated. Our senior herd sire, PRINCE RIVERSIDE WALKER, is by the same sire as Miss Valley Mead De Kol Walker, and is out of the same dam as Aaggie Acme of Riverside 2nd, 1331.77 pounds butter in one year, the world's official record. A young son of PRINCE RIVERSIDE WALKER will introduce this wonderful combination of breeding into your herd. Only a few on hand and they are priced so reasonably that they will not remain unsold very long.

Our Entire Herd is Tuberculin Tested

## Tulare Holstein Farm

W. J. Higdon, Owner TULARE, CAL. H. L. Redd, Herdsman

## — Just the Bull You Need —

### A Son of King Mead of Riverside

To increase your herd production and improve its type and markings. He is a nice one, ready for service, straight, deep-bodied and three-fourths white. Remember that King Mead is in the front rank as a sire of great yearly record cows, and no other bull of the Holstein breed has transmitted as high per cent butterfat.

The dam has a record of 818.86 pounds butter and 21.14 pounds milk in a year. She has two sisters that average 1110 pounds butter and 28,817 pounds milk. She is a daughter of Ignaro De Kol, the only bull in the world with ten daughters that have each produced 20,000 pounds milk in a year. You will miss a golden opportunity if you overlook this one. The price is within the means of any progressive dairyman.

A. W. MORRIS & SONS CORP.

Woodland, Cal.

## Breed Leaders

Every breed of livestock has its outstanding character the same as the human kind. A great dairy cow has proved her ability to produce anywhere up to 15 tons of milk annually; the trotting horse has secured his record around two minutes; the beefmaker has shown his ability to make the least amount of feed into the greatest amount of food; swine, sheep and others of the livestock family have shown themselves great characters. In addition—and here is where their worth is proven—these animals can transmit their productive power to their offspring.

Beginning with the issue of August 4 the Cultivator gave an account of Pietertje Bloom of the university farm dairy herd. Some things she has done and more that her daughters have done were chronicled. She was a most worthy leader in this series of articles. Others of her kind follow. More of the "handsome is as handsome does" type of animals will be given in the columns of the Cultivator during the next few months.

Written for California Cultivator By W. Bernstein

### IN HONOR OF CANDY KID

**T**HIS famous Poland-China sow, which has held such a prominent place among this breed in California and has probably attracted as much attention in the state as any in the

third floor and shown in the room where the banquet was held.

Candy Kid has raised a number of litters, one litter being 12 in number. Out of her last litter two sows were sold at one year of age at the consignment sale February 20, one bring-

Candy Kid

breed, was farrowed March 1, 1913. Her sire was Speedway No. 153167 and her dam was Goldenrod No. 239020. Candy Kid was bred on the ranch of Thomas Hunter, president of the American Recording Company, at Morrow, Ohio. Probably no better blood lines were ever crossed than in the breeding of Candy Kid, and none have ever shown greater results than in this valuable sow.

She farrowed her first litter in the spring of 1914, from which she raised six pigs. She made her first appearance in the show ring at the state fair in the fall of 1914 where she received the award of grand champion. Showing at the same time with her sisters, Chocolate Drop and Taffy Girl, and brother, All Is Well, they received second in herd over one year, while my older herd, headed by Kings Wonder, in this same contest won first in herd over one year.

Following the state fair in the same fall Candy Kid won the same honors at the Kings County fair where she was passed on by two judges. At the P. P. I. E. she was placed second as she was not fat enough to do herself justice.

To increase interest in a meeting held in Fresno for the purpose of discussing the proposition of establishing stockyards there, at the request of the Commercial Club she was taken to Fresno and by means of the passenger elevator was carried to the

ing \$300 and the other \$210. She is due to farrow again on March 26, having been bred to the same boar that was the sire of the two sows mentioned above.

My brother's boar, President, was the sire of the above sows. When she was bred to him she was too fat at the time of breeding and only farrowed five pigs, but if she never farrowed again, in the three sows she raised from the last litter she has done herself proud and much for the Poland-China breed.

The most that Candy Kid ever weighed so far as I know was 702 pounds. She is an extremely easy feeder and is an ideal mother. She has been admired by hundreds of people who have visited my ranch and in particular by the boys' clubs, some of whom have come long distances to see her. The boys have had my best wishes and along with them the hope that they may be fortunate enough some day to get a sow as good as I consider Candy Kid.

What her real value has been to me might seem a joke to some breeders but it has been so real to me that I have never even considered an offer for her. As time passes I may own a sow as good as Candy Kid—I may own some that will bring me more dollars and cents because of the increased value of pure bloods, but I am sure that I will never own a better one.

## Silage for Hogs

It has been proven that pigs on a good alfalfa pasture with grain added grow far more satisfactorily and produce meat far cheaper than where fed on exclusive grain diet. Hence the question has often come, "Why not silage for hogs?" It has been tried and with varying success. Many hog growers think it is too bulky. The question is discussed in The Rural New Yorker, and that because of resolutions, or rather a telegram, sent

by farm bureau agents of California to President Wilson, in which the points were made.

1. To urge the building of a silo and planting of sweet sorghums for silage and for syrup on every dairy farm in California.

2. Put out on 20,000 farms one good brood sow or two pigs in order to increase the amount of pork that state will raise. At least 40,000 more hogs will be so raised.

# Fourth Sacramento SALE

150 Registered Holsteins 150

Sacramento, June 5-6, 1918

A Sale of Extraordinary Character

Featuring some of the most highly bred cattle yet offered in a California sale.

Cows with official records up to over 30 pounds butter in seven days!

## Reliance Irrigation Meter

For Open Ditches, Reservoirs and Gravity Pipe Lines

The Reliance Meter is recognized by water companies and irrigators to be the most accurate and impartial method of measuring water. Send for Copy of Water Watch.

Hydrometric Co. 955 North Main St. Los Angeles Cal.

The R. N.-Y. comments as follows: "Others refer to boy and woman labor, simpler plans, tested seed and fire protection for grain fields. They were all sensible, and the two here printed ought to be considered everywhere. The sugar situation is hard. We are told in Washington that a larger supply of sugar is expected during the summer, but we should all try to help out with a home supply of sweets. We have little faith in the advice to grow sugar beets for home sugar making. Sorghum will make a good syrup and can be grown on nearly every farm. It also makes good stock fodder. As for the silo, there should be five times as many as are now to be found in New York and New England. There were 43,629 silos in New York in 1916. The brood sow is a farm lady and she will help carry the army on her back. We know now that we can make pork on pasture. It is no longer a question of feeding grain entirely. The pig is a grazing animal; as much so as a cow or sheep—if we give him a chance. Silo, sorghum and sow! A great combination—as straight as the S is crooked!"

### DAIRY CIRCULAR

A valuable circular issued by the experiment station of our state college of agriculture is "Factors of Importance in Producing Milk of Low Bacterial Count," a study of the sources of bacteria in milk. It includes practical suggestions for keeping down the number. As bacteria exist in the udders of all cows, all raw milk contains some bacteria, but it is not necessary to encourage their increase, states the circular. Professor C. L. Roadhouse, its author, says nothing can be done to lessen the bacterial content of the normal udder except to keep the cows out of deep mud, and particularly the mud of the stable yard, which is permeated with bacteria that cause udder trouble.

The necessity for extreme cleanliness is urged and careful directions are given for each stage in the handling of the milk. Professor Roadhouse tells how to care for the cows before milking so that no dirt from the body or udder of the cow may find its way into the milk, how to keep down dust in the milking stable by feeding the cows an appreciable time before milking and then sprinkling the stable, urges the importance of personal cleanliness of the milker, and gives full and detailed directions for the washing and sterilizing of all utensils used. He also gives plans and specifications for three different sterilizer tanks, costing approximately \$11, \$22 and \$27, and directions for building a simple outdoor furnace for heating the water in the tanks.

For proper cleansing, dairy utensils should be first washed in cold or warm water to remove milk and any sediment, then brushed with a washing solution, prepared from salsoda or from one of the commercial washing powders, followed by rinsing in warm water to remove the washing solution—and then the utensils may contain thousands of bacteria! To destroy these, the utensils must be thoroughly sterilized with steam or boiling water. Professor Roadhouse says unsterilized utensils are the greatest source of bacteria in milk. The circular may be obtained free of cost by writing the University of California, College of Agriculture at Berkeley.

Production

## When You Look at Our Wonderful Sire King Korndyke Pontiac 106519

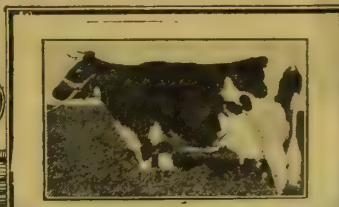

and then look at his dam's picture below, is it any wonder that he should be a real producer? The best evidence, however, is what his get is really doing. At the present time we have but one daughter in milk, and she certainly is a producer in every sense, with a most uniform udder and in every particular the real dairy type. We then have a number of yearlings and some few that are approximately 18 months old and are bred to calf at two years of age. It is difficult to imagine more beautiful and more uniform animals, possessing wonderful individuality, straight top lines, with all the characteristics that make the real dairy cow, namely, capacity, size, the small head and neck, the large middle and big bone. But you ought to see his calves this spring! We simply can't describe them, and only hope you can call some day and look them over personally. These are calves from the heifers sired by our other sire, Prince Gelsche Walker Korndyke No. 137414, and the combination, which we always felt would work out just right, is now an established fact. One look would convince any breeder. Don't you think it would pay to own one of his bull calves, raise him yourself, get him reasonably and thus build up your herd? One look and we know the answer is "Yes." Take our advice, you can't miss!

## "Whenever I Find Korndyke De Kol's Prince in a Pedigree My Respect for That Pedigree is Always Increased"

That statement was made publicly by Mr. A. A. Hartshorn, Hamilton, New York, formerly President of the Holstein-Friesian Association of America, during the last October Sale at Sacramento, which he attended. Mr. Hartshorn is noted for his accomplishments as a Holstein breeder, and one of the greatest factors in his success has been the way in which he sticks close to the practice of selecting individuals and families that transmit uniformly high production.

### Prince Alcartra Korndyke

our senior herd sire, is a son of Korndyke Queen De Kol's Prince, and his dam is Tilly Alcartra, 40.78 pounds butter in seven days after making a total of 123,351.3 pounds milk and 4,919.12 pounds butter in five consecutive years.

PRINCE ALCARTRA KORNDYKE is breeding on. His first five daughters to complete yearly tests as two year olds average 15,333 pounds milk and 675.92 pounds butter.

In a son of PRINCE ALCARTRA KORNDYKE out of one of our good cows you get the greatest certainty of the power to transmit high production and the type that should go with it. Let us price one of his sons to you now before prices advance as his daughters continue to make further high records.

The J. S. Gibson Co. Williams, Cal.

Clean and Clear as Water

Awarded Gold Medal Pan-Pac. Expo.

## For Contagious Abortion

Thorough use of B-K as outlined in our Bulletin 52, "Contagious Abortion," is the surest means known of controlling Contagious Abortion, preventing Barrenness, and removing Retained Afterbirth.

Complete irrigation of the uterus and vaginal tract is easy with B-K. B-K kills the infecting germs and foul odors—heals the uterus—removes the slime and acid—no irritation—no straining. B-K is much more effective and safer to use than lysol, carbolic acid, Lugol's solution or coal-tar disinfectants, which do not cleanse the uterus, but make it more acid.

If your dealer does not have B-K, send us his name.

FREE BULLETINS: Send for complete information—"Special trial offer" and bulletins No. 52, "Contagious Abortion," and No. 136, "Calf Scours."

General Laboratories 3125 So. Dickinson St., Madison, Wis., U.S.A.

## Come to Stanislaus County for Registered Holsteins

### STANISLAUS COUNTY LEADS

All counties of California in number of herds of registered Holsteins and number of 30 pound sires in service.

I have for sale a 14 months old son of  
**Abbie DeKol of East Bank 2d**  
winner of third prize in California Dairy Competition, 656.1 pounds butter fat in ten months. He is a fine, straight individual, and sired by a son of a great show cow that won prizes in the butter fat competition at two fairs. Priced right.  
**H. E. CORNWELL,**  
Route B Box 183, Modesto, Cal.

**White House Holsteins**  
A well bred proven herd sire for sale, also a few bull calves.  
A. M. Bibens, Rt. 1, Box 307, Modesto, Cal.

**Thompson's Registered Holsteins**  
Young bull calves for sale with yearly record backing.  
Luther Thompson, Rt. A, Box 351, Modesto Cal.

**Creamcup Holsteins**  
Headed by the 33.92 pound bull Creamcup Champion Pontiac Burke. A few young bulls for sale.. **M. HOLDRIDGE, Rt. B, Box 366, Modesto, Cal.**

**Pelandale Holsteins**  
Headed by Hazelwood Mercedes Posch Ormsby. Good young bulls and a few registered cows for sale.  
J. A. Pelanda, Rt. B, Modesto, Cal.

**HOLMES STOCK FARM**  
Registered Holsteins of best breeding. Young bulls for sale.  
R. L. Holmes Modesto, Cal.

**Segis Pontiac De Kol Dutch**  
Whose three nearest dams are 1000 pound cows that average over 30 pounds in 7 days, heads my herd. Bull calves for sale. E. E. Freeman, Rt. B, Modesto

**SUNNY STANISLAUS**  
The county where "water—wealth—Contentment—Health" as well as the county where are some of the finest dairies in the world.

Our "Senior Herd Sire is **KING KORNDYKE HENGVERVELD ORMSBY 7th**  
Five of his sisters sold at public auction for \$23,800, an average of \$4760.  
This blood has made some of the world's greatest producers. Our junior herd sire is **TOYON KING KORNDYKE SOLDENE**, son of a 33.23 pound daughter of King Hengerveld Aaggie Fayne. Young bulls for sale. No females.  
**REGISTERED BERKSHIRE BOARS**, sons of the \$1500 boar Star Leader, for sale.  
**Kounias Registered Stock Farms, Modesto, Cal.**

## Santa Anita Rancho Anoakia Breeding Farm Registered Holsteins

Our Junior Herd Sire, **Prince Walker Cornucopia** is now in active service and will be bred to a large number of high class cows and heifers during the coming year.  
His sire is **PRINCE GELSCHER WALKER**, whose daughters have commanded the attention of the entire Holstein breeding world through their tremendous records.

His dam is **ALBA SADIE CORNUCOPIA CREETIA**, 34.14 pounds butter in seven days, and she is by a son of Sadie Vale Concordia, 30.64 pounds butter in seven days, who is the dam of Sadie Vale Concordia 4th, 41.06 pounds butter in seven days, and she in turn is the dam of the sensational sire King Korndyke Sadie Vale and Sadie Vale Concordia 4th Pletje, 38.43 pounds butter in seven days.  
This combination of breeding we consider of exceptional promise and an outstanding offspring should result from the splendid females with which he is being mated.  
At present we are sold down to a limited number of young bulls, sons of our senior sire **MERCI LAD KORNDYKE BURKE**, whose dam made \$1,034.1 pounds milk and 1201.06 pounds butter in one year. They are priced moderately. Inquiries or orders by mail will receive prompt attention.

**Santa Anita Rancho, Santa Anita Cal.**

## Field Notes from the Live Stock Men

D. F. Conant of Modesto, has a number of his best Jerseys coming fresh at early dates. They will all be put on test. He has sold off a few of his young heifers as he has been slightly overstocked with this class of stock.

Reported sales of young Jersey bulls from the Modesto Venadera herd of Guy H. Miller: A bull calf by Altama Interest out of Lorna of Venadera to W. E. Miller, Stratford; a young bull and heifer to A. W. Nolan, Forestville; a young bull to Homer Winton, Camp Meeker.

Hale I. Marsh, Modesto, reports good sales of Poland-Chinas, with orders booked ahead. His futurity litters are very promising.

Recent sales of young Jersey bulls from C. D. Hayworth's Rico Vegas Farm at Modesto have been made to J. W. Garlic, Modesto; Van Assen Bros., Ripon; and W. Michaud, Ceres, who purchased Exile of Rico Vegas, first and reserve grand champion at Modesto and second in class at the San Francisco Land Show, both in 1917. Mr. Hayworth says that during the last six months he has had more calls for bulls, heifers and mature cows than ever before.

J. J. Flaherty, cashier of the First National Bank of Orland, which has a settled policy of loaning money for the purchase of registered Jersey cows in the Orland district, said in a speech made at the banquet at the annual meeting of the Orland Jersey Cattle Club: "We consider our loans for this purpose as the best, cleanest and safest of all the paper the bank holds. Since we began to make these loans we have never lost a cent, either principal or interest."

J. E. Thorpe, Lockeford, has a fine futurity litter of Duroc-Jerseys.

N. H. Locke, Lockeford, is completing a modern milking barn that will accommodate 100 head.

Eldorado Winfred, a senior two year old Holstein heifer bred and owned by Alex Whaley, Tulare, is on official test and has to her credit 25.15 pounds butter from 529.5 pounds milk in seven days. She is now milking around 80 pounds per day. She is sired by Sir Holland Gamp, the great

show bull formerly at the head of Mr. Whaley's herd and is out of Winfred Hotaling 3d, 32.19 pounds butter in seven days, the great cow that brought \$1750 for Mr. Whaley in the Guaranty Sale.

Pacific States Corporation, owners of Tagus Ranch, Tulare, recently completed the first group of the season's official records in their herd of registered Holsteins. El Prado Mercedes made 480.1 pounds milk and 21.84 pounds butter and Mercedes Colantha Aaggie made as a junior three year old 403.3 pounds milk and 18.08 pounds butter in seven days. Both of these are daughters of Colantha Sir Pontiac Aaggie. Rosina Gamp made 20.81 pounds butter from 383.9 pounds milk in seven days, and she is a daughter of Sir Holland Gamp. Tagus Parthena Korndyke, a senior four year old, made 20.11 pounds butter from 406 pounds milk, and Lockhaven Posie De Kol made 17.75 pounds butter from 366.3 pounds milk in seven days. Frank E. Gillam, in charge of the dairy department at Tagus, has a string of good ones coming up for test and should have another bunch of good records to report before the end of the season.

Raphaella Johanna Aaggie 3d, a registered Holstein cow owned by Napa State Hospital, Napa, is making a wonderful milk record. From last reports she had 927.38 pounds milk and over 31.5 pounds butter to her credit on official test in seven days. This is the second highest seven day milk record in the world, being exceeded only by the Canadian cow May Echo Sylvia, who made 1005 pounds milk in seven days under official test.

W. A. Young and J. A. Clark of Lodi are justly proud of their herd sire, Big Bone Bob, who in fair flesh at 14 months weighs 600 pounds. He is a son of a world's champion, Long Big Bone, who is just 1115 pounds of pork. Big Bone Bob's dam is Model Wonder, weight 850 pounds. She was sired by Peerless Big Bob, 1120 pounds. This firm reports recent purchases: A gilt from A. H. Sevre, Dows, Iowa, bred to Golden Gate King; a gilt from C. H. Porter, Eagle Grove, Iowa, bred to Big Kover; a very fancy bred August sow pig from Ed D. Fraser, Dextrel, Missouri.

## High Quality Poland-Chinas

William Bernstein, one of the Poland-China breeders in that little Poland-China county, sometimes known as the Kingdom of Kings, has been a breeder of some of the finest Poland-Chinas the state has ever seen. This has been shown by their winnings at the International Exposition, at state and other fairs for years. Now Mr. Bernstein announces that he is compelled to greatly reduce his herd because he finds it impossible to spare enough time to properly look after so large a herd as he has always kept. To that end he is going to have a sale and writes that some of the stock that he regrets to see leave will be sold under the hammer at Hanford, April 17. The sale will be preceded by one of Bernstein's famous lunches which will be served at 11:30 A. M.

While most of the animals to be sold are young stock ranging in age from five to ten months, there are enough of the older and thoroughly tried animals to be sold to induce a large number of buyers to attend.

Among the boars is Young Jumbo,

an animal that has every promise of being the foremost Poland-China boar in this state. He was acquired by Mr. Bernstein for the purpose of heading his herd and to represent his herd in the show ring, but he has been put in this sale for the purpose of adding interest to it. There are some equally high class sows to be sold. Any breeder needing new blood, young or old, will find it to his advantage to attend this sale.

In all 60 head are to be sold. Col. Ben A. Rhoades is the auctioneer.

### CALIFORNIA GUERNSEY

Only a few Guernsey cows have been tested in California, but the character of the records has been remarkable and there are more good ones in sight. The latest member of the breed to come to the front is G. W. Wilder's Class B cow, Imp. Brittleware Mistletoe 48510. She calved November 25, 1916 and was placed on test December 1, 1916, completing her year with a record of 14,467.2 pounds of milk and 751.38 pounds of butter

fat. This record entitles her to eighth place among the leaders in Class B.

Imp. Brittleware Mistletoe 48510 was bred in England by Godfrey Oakley, and imported by J. L. Hope of Madison, New Jersey. She is a daughter of Admiral of the Briquet 2116 E. G. H. B., A. R., and Brittleware Stella 6077 E. G. H. B. This makes her a granddaughter of Imp. Fanny's Sequel 19563 A. R., and a double great granddaughter of Imp. Masher's Sequel 11462 A. R., with 68 daughters and 19 sons in the Advanced Register. Had she been kept in the certified barn and her 14,467.2 pounds of milk sold as Hollow-Hill Farm certified milk, which brings 20 cents per quart, at retail, the returns for labor and feed would have been approximately \$1377. Her milk was separated and the cream made into butter for home use so no accurate amount of profit can be given.

### R. F. GUERIN HOLSTEIN SALE

Written for California Cultivator  
By C. A. Briggs

On April 4 at the farm between Tulare and Visalia the California Breeders' Sales and Pedigree Company held a dispersal sale of the mature animals in the herd of R. F. Guerin. C. L. Hughes, sales manager, and Col. Ben A. Rhoades, auctioneer, say that all things considered this was the most successful sale of registered Holsteins ever held in the state. The crowd was large and the bidding brisk. The particular and most satisfactory features of the sale are that the bulls sold well and that they and many of the good cows and heifers went into the hands of farmers and dairymen in Tulare County. New buyers form quite a percentage of the list of purchasers.

Eighty head were sold, bringing the very satisfactory total of \$27,520, an average of \$346.50 a head. The buyers were H. A. De Wolfe, Ripon; H. M. Cross, Merced; E. Ratterbury, Crows Landing; Robert S. Curtis & Son, Exeter; J. E. Peck, Calexico; W. J. Higdon, Tulare; Bohnett Bros., Campbell; F. M. Helm, Fresno; H. V. Greenwood, Vallejo; H. E. Vogel, Fresno; W. F. Mitchell, Tulare; F. C. Van Loan, Visalia; A. E. Montgomery, Merced; E. R. Atterbury, Crows Landing; Geo. Sibley, Tulare; J. P. Phillips, Fresno; Robert Whaley, Tulare; C. A. Pears, Tulare; L. C. Clark, Visalia; F. M. Elmo, Tulare; Alex Whaley, Tulare; E. A. Hesseltine, Tulare; W. Bernstein, Hanford; Chas. H. Holmes, Tulare; R. L. Waltz, Hardwick; H. C. Pearce, Tulare; Louis Stiner, Visalia; F. D. Campbell, Tulare; H. D. McCune, Le-moore; Henry Anderson, Tulare.

### WORKING RESERVE

The state council of defense has inaugurated a campaign for the enrollment of 37,000 high school boys in the working reserve. The drive for enlistment in this reserve will begin April 15.

Plans for the enrollment campaign provide: That every high school principal throughout the state shall act as enlistment officer; that all boys desiring to enlist in the reserve shall go to the nearest high school principal; that farmers who contemplate using parties of boys as farm workers during the coming summer shall apply to country farm advisers; that the Y. M. C. A. will send trained field agents with each party of boys to look after their physical and moral welfare.

"Raise more alfalfa"  
-is the cry of the stock interests to the ranchers of California

Despite the late rains the supply of hay for the next twelve months will fall far short of meeting the normal demand, according to authorities who have carefully studied the situation. The ranchers of the State must loyally come to the rescue by planting alfalfa at once. By doing so they will fatten their bank accounts and save the great stock interests of California.

Take no chances with seed of doubtful quality. Buy German's Selected Alfalfa Seed and insure bountiful crops of high-food-value hay. Place your order TODAY!

## Use the Moline Mower for Tough Heavy Cutting

On the rear of the Moline Mower you will notice a bell shaped gear. When this gear gets into motion it has the same effect on the sickle as a fly wheel on any machine and carries the mower through heavy and difficult cutting where other mowers fail. You can always depend on the Moline.

This is the same principle that was used on the old Adriance Buckeye Mower 60 years ago, and you won't find it on any other mower on the market. In fact, this mower is the old original Buckeye, now called the Moline Mower, and is greatly improved. Every user of a Moline Mower profits by these years of service and knows his Moline Mower will not fail him in a "pinch."

Other features such as, one-piece main frame; cold rolled steel axle and shaft; pawls and ratchets in plain view; coupling frame hinges which will not bind; five-inch driving wheels, extra heavy cutting parts; removable wearing plates; alignment device for the cutter bar; spring draft; forward acting foot lever and many other distinctive features, carry the Moline Mower through tough cutting year after year.

It will be worth a whole lot to you to have a Moline Mower at work on your farm. Remember when you get a Moline Mower you get the product of one of the oldest and most reliable concerns in the business. This means that you can always get repairs for a Moline Mower.

Your Moline dealer will be glad to show you the Moline Mower or if there is no Moline dealer in your locality write us for full information. Address Dept. 49.

 A DAUGHTER OF A 23 POUND COW heavy with calf to a 30 pound grandson of Sir Rag Apple Korndyke.  
 THE GRAND CHAMPION COW at 1916 Modesto Fair, bred to the 30 pound show bull El Prado Wayne Colantha.  
 THREE DAUGHTERS OF MODESTO NYDIA who has five A. R. O. daughters with records up to 25.74 pounds butter in seven days, 926.35 pounds in one year, two of them with over 20,000 pounds milk in one year.  
 NINE DAUGHTERS OF SALAMBO CAPTAIN, who has 11 A. R. O. daughters with records up to 24.26 pounds butter in seven days.  
 FIVE DAUGHTERS OF ACME PONTIAC, son of King Pontiac Ruby Burke and out of a daughter of Pietertje Bloom, 21,455.3 pounds milk and 754.25 pounds butter in one year.  
 FIFTEEN COWS AND HEIFERS bred to El Prado Wayne Colantha, 30 pound son of Colantha Sir Pontiac Aagie, and first prize aged bull at 1917 California State Fair.  
 A 22.78 POUND GRANDDAUGHTER OF KING SEGIS bred to Pride Fayne Valdesa.  
 AN A. R. O. GRANDDAUGHTER OF JULIANA DE KOL, former world's record two year old, bred to Colantha Sir Pontiac Aagie.  
 AN A. R. O. GRANDDAUGHTER OF IGNARO DE KOL, the greatest sire of yearly record cows of the breed, bred to Pride Fayne Valdesa.  
 A GRANDDAUGHTER OF ALCARTRA POLKADOT CORRECTOR, sire of Tilly Alcartra, bred to Colantha Sir Pontiac Aagie.  
 FOUR COWS AND HEIFERS BRED TO PRIDE FAYNE VALDESSA whose sire is by King Hengerveld Aagie Fayne and out of FINDERNE PRIDE JOHANNA RUE, 1470.59 pounds butter in one year, world's record when made, and whose dam is a daughter of Valdesa Scott 2nd, 41.88 pounds butter in seven days, 164.29 pounds in 30 days.  
 SEVEN COWS AND HEIFERS BRED TO COLANTHA SIR PONTIAC AAGIE, son of Colantha Johanna Lad, and he already has a good list of A. R. O. daughters, including Moorland Johanna Haskins, 32.86 pounds butter in seven days as a junior three year old.

## BULLS

Only a few young bulls will be offered, including a son of Colantha Sir Pontiac Aagie out of a 22.62 pound three year old; a son of the 31 pound sire, King Pontiac Ormsby Segis; four sons of the 30 pound show bull, El Prado Wayne Colantha.

All of the above and others of equal merit will be sold in the

## North San Joaquin Breeders' First Consignment Sale

Modesto, California, Thursday, May 9, 1918

The sale will be governed by the regular rules of this company, every animal pledged to absolute sale without reserve, limit, or by-bid, every animal guaranteed to be a breeder, tuberculin tested, and sold subject to tuberculin retest by the purchaser.

## WHY COWS ARE SO

The Story of Posy and Elfy, by Leroy Anderson

HEY were two registered Jerseys, both sired by Minette's Pedro, and since their dams were distantly related, they were a little better than half sisters. During their first two lactation periods they had varied so widely in milk production that they were thought fruitful subjects of investigation as to the possible causes of such wide variation. Accordingly they were bred at the same time in order that they might begin the third lactation period together. In age they were about equal and in weight about 900 pounds each.

In planning the investigation it was considered that there may be four possible causes of the wide difference in milk producing powers which are found in every dairy herd, and which may be indicated in the following manner. In order to save space, the method of solving each case is here given along with the statement thereof. Posy is the cow having the high production of milk, while Elfy is the inferior cow.

A. Difference in the coefficient of digestion, which means that possibly the inferior cow digests a smaller percentage of its food and hence has less to turn into milk. When the cows were in full milk a ten-day digestion trial was made with the result that Posy digested 64.39 per cent of her food and Elfy 64.99 per cent. It may be said that the coefficient of digestion is the same for each, and this possible source of variation is eliminated.

B. The inferior cow may require a larger portion of food for maintenance than the superior cow and thus have less food from which to make milk. A cow normally uses its food for two purposes; one to maintain the body and the other to manufacture milk. The solution of the maintenance question could not be made until the milking period was over. Hence the cows were not bred and when dry each was fed for 160 to 180 days on a ration which was sufficient to keep her at an even weight. The ration was the same as to kinds of feed which they had when in milk, but of course much less in quantity. The grain mixture was cornmeal four parts, wheat bran two parts and linseed oil meal one part. The roughage consisted of choice alfalfa hay and good corn silage. Based upon the 180 day trial the maintenance requirement of each cow for a year is as follows:

	Grain	Hay	Silage
Posy .....	1201	1204	4818
Elfy .....	1066	1066	4292
	135	138	526

Posy, the better cow, required slightly more food for maintenance than Elfy, which is contrary to our expectation. However, the difference is so small that the requirements may be considered practically equal. This test conforms to other experimental evidence that cows of equal weight need similar amounts of food to maintain the body.

C. Possibly the inferior cow uses some of its food above maintenance requirements for the production of body fat. This factor was eliminated by keeping each cow at an even weight throughout the milking period. Neither one gained more than 20 or 25 pounds in weight during the year, and thus little food was used for storage in the body by either cow.

D. The cause of variation in milk yield may lie in the difference in the amount of food consumed and used for producing milk in excess of the ration of maintenance.

The feed consumed by each cow during the year was as follows in pounds:

	Grain	Hay	Silage	Green feed (soiling)
Posy ....	3424	2904	8778	4325
Elfy ....	1907	1698	5088	2102

Considering all feeds, Posy ate 1 1/4 pounds to each one pound eaten by Elfy.

We may now consider how much feed each cow had available for production of milk after the maintenance requirement is deducted.

## THE SELF-OILING WINDMILL

has become so popular in its first three years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load. We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws.

Maintenance..	1200	1204	4818	.....
Available for milk product'n	2224	1700	3960	4325
Elfy				
	Green		Green	
	Grain	Hay	Silage	Feed
Consumed.....	1907	1698	5088	2102
Maintenance..	1066	1066	4292	.....

Available for milk product'n 841 632 796 2102  
Considering all the feeds, Posy had 2 2-3 pounds available for milk production to one pound for Elfy.  
Calculated on the percentage basis the relative use of feed looks like this:

	Used for Maintenance	Available for Milk Product'n
Posy.....	35 Per Cent	65 Per Cent
Elfy.....	56 Per Cent	44 Per Cent

The milk and fat yield of the two cows:

	Per Cent	
	Lbs. Milk	Lbs. Fat
Posy.....	8523	470
Elfy.....	3189	169

Posy produced 2 2-3 pounds of milk to Elfy 1 pound.  
Posy produced 2 3/4 pounds of fat to Elfy 1 pound.  
Posy ate 1 1/2 times as much feed as Elfy. Posy had available for milk production, above maintenance, 2 2-3 times as much feed as Elfy, and she made 2 2-3 times as much milk as Elfy. After maintenance requirements were satisfied each cow produced milk at a similar feed cost, but where Elfy lost is in requiring so large a proportion of her total food for body maintenance.

The manner in which Posy is superior to Elfy indicates the quality of all superior cows, namely their capacity to handle a large amount of food above maintenance requirements and turn that extra food into milk.

Someone may ask, did Elfy have enough to eat during the investigation? It is common observation that the low producing cow may have a strong tendency to lay on body fat, and if Elfy was fed in such manner as to prevent that, did she have enough to eat, or would she have produced more milk if she had been given more feed? During the year's test it was thought that she received quite as much food as she required. She was never ravenous for food as was Posy, always looking for her rations, but was indifferent about eating. However, to satisfy the question Elfy was bred at the close of her maintenance trial and after calving was given the same ration as when on test with Posy, and the grain portion increased to as much as 14.8 pounds daily. At the same time she was given all the hay and silage she would eat, but when the grain was increased to the maximum she refused silage entirely. The results of this feeding for 70 days were as follows:

Feed and milk yield in ten day periods:

Ten day period after calving.....	Pounds of Grain.....	Pounds Alfalfa Hay.....	Pounds Corn Silage.....	Total Pounds Milk.....	Pounds of Milk for similar periods during test with Posy.....
2.....	59	78.5	150.0	185.6	139.6
3.....	84	103.4	72.5	190.7	147.3
4.....	93	91.0	108.5	193.8	156.4
5.....	112	87.0	74.3	203.4	150.2
6.....	130	79.4	75.3	192.5	137.5
7.....	145	108.7	59.8	189.0	135.2
8.....	148	111.0	.....	187.2	138.4

Elfy gave four to five pounds more milk daily in this fourth lactation period than she did in the third when she was on the trial with Posy. However, she produced no greater quantity on the very heavy feeding than on the lighter ration similar in quantity to that given in the trial with Posy, from which we may conclude that in that trial she had a fair chance to do her best. She gained 25 pounds in weight during these 70 days.

The kind of cows we want in our herds are those with the capacity like Posy's. The chief and the great factor

in securing them is inheritance through rigid selection. The original report of this investigation is given in Research Bulletin No. 2 of the Missouri College of Agriculture.

#### BALANCED RATIOS FOR BROOD SOWS

The following rations for brood sows are suggested by J. S. Coffey of the Ohio State University:

1. Corn one part, skim milk six parts.
2. Corn two parts, shorts three parts.
3. Corn one part, middlings two parts, oats one part. Add five per cent oil meal to this mixture.
4. Barley, oats and shorts in equal parts.
5. Barley and oats in equal parts; mix with three pounds of skimmed milk per pound of grain mixture.

6. Barley, peas and shorts. Ration 2:1:1.
7. Corn, oats and oil meal. Ration 5:2:1.
8. Corn and tannage. Ration 8:1.

As Ohio is a corn state the use of corn appears in many of the above rations, but California swine breeders may bear in mind that sorghum grains show by analysis practically same nutrients as corn.

## How to keep your Ford engine running like new

Every car has different lubricating problems. In the Ford the special problem arises from the exclusive and ingenious construction by which the disc clutch and transmission gears are enclosed with the engine.

In other makes of cars, these three parts are separate, and the oiling requirements of each are met by a different lubricant.

In the Ford, one oil must lubricate all three of these parts—the engine, transmission gears and the disc clutch.

#### Faulty lubrication causes 90% of trouble

A careful analysis of the causes for trouble in the Ford engine shows that improper lubrication is to blame for 90% of them. This is largely due to the sediment formed by ordinary oil which breaks down under the heat of the engine. This sediment crowds the oil with lubricat-

ing qualities away from points where it is most needed, causing friction and rapid wear.

#### The ideal lubricant for your Ford

Ford owners are rapidly learning that Veedol Medium is the ideal lubricant for their cars.

It is heavy enough for the engine and gears, yet light enough so that the clutch does not drag.

Ordinary oil evaporates rapidly under the heat of the engine. Ford owners get 25% to 50% more mileage per gallon with Veedol, because Veedol not only resists destruction by heat and minimizes the consequent formation of sedi-

ment, but also reduces evaporation loss to a negligible quantity.

#### An 80-page book on lubrication for 10c

The most complete book ever published on automobile lubrication, written by a prominent engineer. Contains Veedol Lubrication Chart, showing correct grade of Veedol for every car, winter or summer. Send 10c for a copy. It may save you many dollars.

The famous Sediment Test, showing how Veedol reduces the formation of sediment under engine heat 88%. The left-hand bottle contains ordinary oil and the right-hand bottle Veedol, both taken after 500 miles of running.

In the Ford power plant the engine, transmission gears and disc clutch are ingeniously enclosed together. One oil must meet the different lubrication requirements of these three important parts. Veedol medium is specially made to do this.

## California Grazing Lands and the Live Stock Industry

Written for California Cultivator By A. L. Spellmeyer

CALIFORNIA is a rich state, and it's a large cattle producer, having more cattle than Arizona, Nevada and Utah altogether, and in addition to its beef type cattle it is a great dairy state, and will in the course of time be a great center for pure bred stock of all kinds.

At present probably half or more of the central and southern California area is devoted to live stock grazing, yet is there an experienced, practical live stock man, prominently active in any bank or financial institution, and is there any special interest in the livestock business on the part of any financial institution, other than the cattle loan companies operating on an eight per cent basis and mostly six months time? With the hundreds of millions invested in the California live stock business, it is on a haphazard uncertain basis, with no better methods of running cattle, securing increased production and with actually a lower general grade of cattle than 20 years ago. The borrowing power of a half million dollar ranch is somewhat less than that of a hundred thousand dollar city store.

At this time our nation needs increased meat production and the saving and increase of live stock is a vital necessity. California has been hard hit by drouth and loss, and it is a duty devolving upon banks and ranch owners to facilitate increased production and place this important industry upon a basis of permanence and safety. The beef demand of California is fair and will be better, and while top prices are never in accord with other top prices in Eastern markets, yet prices are never very low, for lower grade stock.

It cannot be denied that the lack of an extra price for finish, quality, and grade of cattle has operated towards lowering the general quality of stock, and for this the packers buying system in California is surely partly responsible.

With half of the grazing ranch owners leasing out their land on a year to year lease, subject to sale, and the other half operating on a temporary basis it's no wonder there is no considerable improvement in cattle or methods of grazing. The cattle business today requires an effort and knowledge to bring success that the lax methods and plentiful range of the past decade did not require. Until eight or ten years ago the cattle business of the entire country was a speculative uncertain business whose trend could not be foretold, but the scarcity of range, the growth of population and shortage of cattle have placed it upon a different basis, and the safest and most profitable business

ness the Middle West bankers have in the live stock loans.

California is as wonderful in possibility to the stock man as it is in other lines of production, and there is no good reason why properly managed 90 per cent calf crops could not be secured and forage crops saved as protection from periodic drouths. With better management ranges can be made to carry more cattle by relieving during the growing season. The Jornada experiment made by the United States forest service in New Mexico is very instructive, and accords with facts practical stock men have also ascertained.

Forage crops saved will prevent actual loss in bad years and increase meat fats in good years, but to cultivate and save forage, build fences, buy better bulls, etc. all takes money. Silage feeding and baby beef production will come to California, but it will take money to back these ventures. Those now doing this are making fair returns.

Personally I consider California, the greatest cow country in the West and, notwithstanding periodic drouths, offering unusual opportunities, which will be realized when the large acreage owners of land not at present good for anything but stock grazing realize facts, and either sell it at a possible living price for the stock industry or put their own cattle on and run it efficiently towards maximum returns for the stock business, and forget for awhile that land might have oil or a mine, or might raise almonds, or pecans, or tea in the future. There is no question that beef needs will greatly increase in the West and that this wonderful country will be closely populated in time, but that is all in the course of natural and expected development.

The value and importance of the live stock business is greater than the entire oil and citrus industries of the state together, and the hundreds of millions invested in cattle, sheep, hogs and horses is more than equaled by the hundreds of millions investment in the ranches they run on. The citrus and other agricultural pursuits depend upon the livestock business for their fertilizer and for the market for the hay, grain and green alfalfa. The people depend upon the live stock business for their food, their clothing and their shoes, and yet bankers in California don't consider or make any effort to supply cheap money to this industry, which is the basic industry of their state.

Acceptance of grazing land as grazing lands, by land owners, and cheap money from banks, will work great things and increased production and general prosperity for the great state of California.

## Veterinary Queries

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal. Unsigned communications receive no attention.

Hard Milker

Heifer that came fresh about two months ago gives rich milk but is very hard to milk. Can anything be done to relieve it?—Subscriber, Clovis.

The opening in the teats can be enlarged by cutting or stretching the sphincter muscles that surround the openings. In cutting great care must be exercised or one is liable to cut too much and do more harm than good. It may be better to stretch the openings by inserting an instrument that is made for that purpose. There are several different kinds that can be purchased from veterinary instrument makers. Some are of the shape of a small collar button. These are to

When writing advertisers, mention The Cultivator.

be inserted after milking and left until the next milking. The instruments are of different sizes and by using the small ones first and changing to the larger ones you can soon get the desired results. The instruments should be thoroughly cleaned each time before inserting them to avoid introducing any dirt that would irritate the parts and cause inflammation. You could get along very well for a time by using milking tubes. Use two and empty two of the quarters at a time. Manipulate the udder and teats as when milking and it would flow freely through the tubes.

#### Palsy or St. Vitus Dance

My dog has strained his front leg. He shakes his foot as if he had the palsy. I have taken him to the veterinarian in this city and he says he has strained a nerve in his foot and must be kept quiet. He gave me medicine for the dog but it does not seem to help him. This is a young setter about a year and a half old and is quite valuable. — Subscriber, Marysville.

Your dog has probably had distemper and this is one of the bad results that often follow. The setters seem to suffer more from distemper than other breeds. Properly treated when it first comes on it is seldom followed by palsy but when the palsy is once well established it is hard to relieve. Try this prescription for him: Iodide of potash, 20 grains; strychnia, one-tenth of a grain; gin, one ounce; water enough to make four ounces. Give a teaspoon of the mixture once a day. Aspirin in five grain doses given when he first came down with the distemper would probably have prevented all this trouble.

#### Bog Spavin

I have a colt one year old, and a few days ago a soft swelling came on the hock joint. The colt is fat and in apparently good condition otherwise. Is it spavin? What shall I do for it?—Subscriber, Shafter.

It is probably bog spavin, a trouble that may be caused by a strain causing congestion of the cartilages and ligaments of the joint. To ease the trouble nature provides, a surplus of joint oil (synovia) which puffs out at the weakest point. Reduce the colt in flesh. That will have a tendency to relieve the congestion. Give internally this medicine: Iodide of potash, one ounce; tincture of aconite, one ounce; water to make one pint. Mix. Give one ounce of the mixture on the feed or in the drinking water once a day while it lasts. Also clip off the hair over the enlargement and apply an ointment made of tincture of iodine, one ounce; iodine crystals, half a dram; lard oil enough to make four ounces. Apply a little of the ointment once a day, rubbing it in well. Your colt being young will probably recover quickly with this treatment and in a short time be as good as ever.

#### Bad Results from Castration

I have a Percheron colt coming five years old that ever since he was castrated has had trouble in backing or turning or stepping over in the stall. When harnessing him it seems to hurt him in the hips or loins. When pulling he carries his head low, and when stopping to rest will weave around for a moment until he seems to get his balance. He keeps fat and is well otherwise. What can be the trouble and what can be done for him?—Subscriber, Victorville.

All the trouble you have noticed may be caused by one or both of the spermatic cords not drawing back far enough and having become attached to the side of the scrotum. When castrating colts the cords should be pulled out as far as possible without

snapping before being cut off, then they will draw well back and never give any such trouble as you are having. Better have him examined by a good veterinarian and if he can feel the ends of either cord have him operate on the colt and remove as much of the cord as he can. That will probably end the trouble.

Book Review

#### PRODUCTIVE DAIRYING

"Productive Dairying," by R. M. Washburn, professor dairy husbandry, University of Minnesota, published by J. B. Lippincott, Philadelphia, has 432 pages packed full of valuable information for every dairyman. The book is written for high schools, colleges, or general study course, but it is indexed, and its fund of information of practically every phase of dairy work is complete. While it is an educational work, there is a minimum of technical points touched upon. At the end of each chapter a series of questions help one to review and impress the preceding chapter.

There are 131 illustrations and valuable index and 40 chapters and appendix. The book is divided into seven parts, the first touching upon the Why of Dairying, with three chapters; the second on Dairy Breeds with 15 chapters; the third upon Care and Management of Dairy Cows, four chapters; fourth, Winter Feeding; fifth, Clean Milk Production, with an even ten chapters; sixth, Farm Dairying; seventh, Market Milk, Adulteration, Kinds and Classes, and finally Food Value of Milk, Government Standards, etc. A valuable feature of the appendix is a table on feeding stuffs composition.

One paragraph in the opening chapter is as follows: "The cow as a converter or transformer of coarse, rough feeds into fine grained and more valuable forms has no equal. Physically speaking, the sun is our great original source of warmth and energy. A small portion of the heat which is poured so lavishly upon the earth each summer is captured by the growing plants and stored, some as grain, a little as root crops, but much more in such forms as grass and fodder. Only about 40 per cent of the solar energy captured by our cultivated crops is in a form sufficiently fine to be used by man direct, for example, as corn and potatoes, while the remaining 60 per cent of the energy is in the stalk, leaf, cob and straw. If we add to this amount the meadow hay and permanent pastures, it seems highly probable that fully 75 per cent of the food energy captured in this country, each growing season, is in such form that it is practically useless as food to man until converted by some animal into the form of flesh, milk or eggs. Plants get their energy from the sun and their substance from the soil and air, while animals get both substance and energy from plants (or other animals). Man is no exception."

Milk substitutes are not equal to milk in feeding calves, but give fair results when used with care. Now that milk is in demand for human food they are particularly recommended.

When the calf is two weeks old, grain and bright clean hay should be offered; the quantity fed should be increased as the calf's appetite demands.

Cut out non-essentials; we are in a race with a swift antagonist and need no handicap.

## Use of Lime and Gypsum

Discussing the fundamental principles of the use of lime and gypsum on California soils, Professor Chas. B. Lipman writes:

The term lime, as we may employ it in the agricultural sense, includes the following materials: Burnt lime (oxide of calcium), hydrated or water-slaked lime (hydrate of calcium),

ground limestone or air-slaked lime (carbonate of calcium). Even in the agricultural sense the term lime does not include gypsum. The latter is an entirely different substance from the three named above, as will be explained later. Speaking with the correctness of the chemist the term lime is applied only to burnt lime

(quicklime) or calcium oxide. Just how the three materials discussed agriculturally under the name lime are to be employed and where one is to be preferred to the other, if at all, are questions which are answered below.

Before going into a detailed description of the mission or the function of lime in soils it is well to state clearly the relative values for practice of

(1) the burnt, caustic, or quicklime; (2) the hydrated or water-slaked lime, and (3) the carbonate or air-slaked lime. These lime materials are largely valued for the amount of calcium oxide which they contain. Quicklime is nearly all calcium oxide. Hydrated lime or water-slaked lime contains less calcium oxide but may be looked upon in practice as nearly equivalent ton for ton to the quicklime. Air-slaked lime (like the ground limestone) or carbonate of lime contains only a little more than half the amount of calcium oxide that the quicklime does and therefore two tons of it should be employed if it is used in place of the caustic form. The relative money values can be determined at any time from the foregoing explanation of relationship between the different lime materials. It must also be remembered in that connection, however, that the cost of handling larger quantities and additional freight rates involved must always be taken into consideration in calculating the actual and relative cost of the different materials. The following is a consideration of the function of lime materials in soils:

Lime materials have the power of shrinking clay and making it more pervious to water and air, by making a large number of crumbs from large sticky masses. Therefore, lime makes clay and clay adobe soils looser, prevents their packing, baking and cracking, makes plowing and cultivating easier, and, in general, makes the soil, physically, a healthier medium for plant growth.

Lime materials (as above described) serve as a source of the element calcium to plants. Calcium is one of the ten essential chemical elements in plant growth.

Lime materials make "sour" soil "sweet." Speaking correctly, they change an acid soil condition to a slightly alkaline one. Acidity of soils is very detrimental to the growth of many agricultural crops. A slightly alkaline condition is ideal for them.

Lime materials are necessary for useful and beneficial bacteria and other microorganisms of the soil. It furnishes these the element calcium, which is an essential to them as to the higher plants. It promotes a slightly alkaline condition which is ideal for their development. By its physical effects lime produces good air and moisture conditions for bacteria as above described.

Lime materials promote the normal decay of soil organic matter through their effects on the agencies of decay above described. The normal decay of organic matter in soil prevents accumulation of poisonous materials in soils which are detrimental to plant growth.

Lime will not neutralize sodium carbonate or black alkali.

### Lime on Heavy Soils

No determination needs to be made to inform the owner of heavy land if lime is necessary to improve its texture as above described. The decision both as to the amount to apply and as to the feasibility of applying it must be made on the basis of the cost of lime and the degree of "running together" or baking and cracking, which is characteristic of the soil. From one to two tons of the burnt lime or of the hydrated lime, or from two to four tons of the ground limestone, may be safely applied to improve the working qualities of heavy soils. Application may be made by means of one of the several types of lime spreading machines or the lime may be deposited in piles and spread

## Yuba Ball Tread

There are three features to the "Yuba Ball Tread" to make it superior to all others:

- [1] The Tread
- [2] The Solid Inner Base
- [3] The Polished Steel Balls

The tread lies on the ground; it doesn't move, the rolling balls carry the machine over it. It is tightly drawn over the ball race—no slack to take up—no power wasted—the power generated by the engine is mostly delivered at the draw-bar.

The solid inner base prevents slack.

The steel balls carry the load, and roll easily.

Ball-bearing machines of all kinds are replacing those which consume more power to propel their own mechanism. The less friction the less FUEL; the less friction the less OIL; the less friction the less WEAR & TEAR—*economy in power is money in your pocket.*

GASOLINE ENGINES

Inquire of your Local Dealer for full particulars.

with a shovel. It should be well plowed in and covered up at a time when there is sufficient moisture in the soil for the lime to act well.

The burnt lime or the hydrated lime is to be preferred to the carbonate of lime for making heavy soils lighter if the cost will allow. The first two forms act more vigorously and more quickly. Applications of lime are best made prior to fall or winter plowing or several months prior to planting. This must particularly be borne in mind if either burnt lime or hydrated lime are employed.

**Lime on "Sour" or Acid Soils**

If "sour" soils are also heavy clays or clay adobes, the recommendations for the use of lime above made for heavy soils are to be followed. If sour soils are loams, silts or sands, the ground limestone is to be preferred to the other forms of lime where it is obtainable.

To test your soil for sourness or acidity proceed as follows: Mix some of the surface soil to be tested and moisten thoroughly. Mold it into a ball of wet earth about three or four inches in diameter. Break the ball in two and on one of the broken surfaces place two strips of red litmus paper previously moistened with clean boiled water. (Litmus paper, both red and blue, may be obtained in the drug stores.) Set the broken surfaces of earth together again and press tightly. Perform the same test with another ball of earth, but use blue instead of red litmus paper. Allow the balls of earth to lie undisturbed for half an hour; then open, and if the red litmus paper has turned blue no lime is needed. If it remains red, and the blue litmus paper turns red, lime is needed and should be applied as above directed. If neither the red nor the blue litmus paper should change color during half an hour or more, then the reaction of the soil is neutral and small applications of ground limestone, not to exceed one ton per acre, will be sufficient.

**Nature and Function of Gypsum**

Gypsum is the sulfate of calcium and therefore is not the same as lime nor the same as any of the three forms of the latter above described. The only thing which gypsum has in common with the three lime materials named, from the point of view of chemical composition, is that it, like the others, contains the element calcium. Let us study its functions in soils.

Gypsum exerts a similar effect to that of lime on the clay and adobe soils (see above).

Gypsum, like lime, serves as a source of the element calcium (see above).

Gypsum, like lime, stimulates the beneficial soil organisms on the roots of leguminous plants like the peas, beans, vetches, alfalfas and clover.

Gypsum does not make "sour" soil "sweet." It will not change an acid into a slightly alkaline soil as do the lime materials. Gypsum is a neutral salt (possesses no alkalinity), and therefore will not be of assistance, or act as a corrective to a "sour" or acid soil.

Gypsum does not share with lime, to any appreciable extent, the good effects of the latter on soil organic matter (see above).

Gypsum will neutralize sodium carbonate or "black alkali."

England has gone on rations and each buyer, from the king to the humblest citizen, must present a card to secure his weekly allotment of one and one-quarter pound of meat and four ounces of butter or margarine.

**FIRE FIGHTERS MEET**

Farm Adviser Baade of Napa County writes:

"On Saturday afternoon, April 27, at one o'clock, there will be a meeting at the Napa County Courthouse, at Napa, of the 20 rural fire companies which have been organized in

this county by the farm adviser as per the request of the state and county councils of defense. Each company is composed of 12 men, and the 240 thus called in will be sworn in as firemen, their officers also taking the necessary oaths. They will at this time elect a county chief and a county assistant chief.

"There will be a program, pictures will be taken, and a parade is now being scheduled, which will show that our people are prepared to protect their property during this time of need."

War provides a stage where all may play a part.

**DO YOU USE  
THIS METHOD  
OR THIS**

Time is the stuff of which life is made  
you can't afford to waste it carrying water

Help is scarce—and growing scarcer every year on the farm and everywhere

You can't afford to utilize labor carrying water  
—it makes water too expensive

Put up a redwood tank and install a redwood pipe line  
—it's the sanest investment you can make

In the long run its economy of time labor and money  
—besides it's a lot of real satisfaction

Ask our engineering department to tell you what it would cost to install a redwood tank and pipe line on your place

Very likely you'll be surprised at how little it will cost and certainly you'll be glad when you have it working for you

Water for the house and for the stock—where and when you want it, is the modern up-to-date method for the progressive farmer

Redwood tanks and pipe lines outlast all others and cost less in the first place

## No Tractors Like Case

**N**ONE have the same experience behind them. Case built its first oil burning tractor 26 years ago, and Case has been building power-farming machinery for 76 years.

We have a plant covering 140 acres and we employ over 4,000 skilled mechanics. We have branches throughout the United States and Canada.

Case Kerosene Tractors are offered as tried and proven machines. It is not necessary to do any experimenting with them. They have already been subjected to belt and traction tests at our factory—far more exhaustive than demanded by the average user. This is your assurance that when you put your Case Tractor to work in your fields you will not be disappointed. For performance, materials and workmanship Case Kerosene Tractors rank first. We make them complete in our own shops. We stand back of them just as we have made good our guarantee on other Case machinery since 1842.

Case Kerosene Tractors come in 4 sizes: 9-18, 10-20, 12-25 and 20-40. So there is a size for every farm. Case also continues to make its famous Steam Tractors in 8 sizes.

Send for our latest illustrated catalog, designating whether you are interested in Kerosene Tractors or Steam Tractors or other power farming machinery.

## Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Oily Butter

What is the trouble with my butter? I feed alfalfa meal, barley hay, and cow has salt and is now getting green feed every day. The calf is five days old and the cream skims thick but the butter will not harden and sticks to the paper. It is sweet and nice flavored but is soft. — Subscriber, Spring Valley.

This query is answered by S. L. Deming of the University of California:

"I believe the main source of difficulty is churning the cream too soon after the cow has freshened. It may also be churning at too high a temperature and the butter warms up considerably during the working. Would suggest not using cream from a cow in less than ten days after being fresh and then regulating churning temperature so that the churning may be completed in about 40 minutes. Under ordinary conditions this temperature should be about 58 degrees. The butter should then be washed in water which has about the same temperature as the buttermilk, then worked and salted in the usual manner. If the parchment paper is wet in a salt solution before wrapping the butter it will not stick to the butter to any extent."

### Abnormal Appetite

Have a cow that eats whenever she can get in reach of rags, sacks, ropes, straps, hair such as horses' tails or cows' tails, and she has even eaten all the hair off her own tail. I feed her tame oat hay, Lima bean straw, and she runs in the pasture in day time and gets plenty of green grass. Also keep a box of stock salt and fresh water which she can reach at any time.

Abnormal appetite is sometimes very perplexing, but as a rule it is caused by some deranged digestion or possibly by a ration which is not properly balanced. Cattle on low swampy land are especially predisposed to it, but it sometimes happens that one cow in a herd seems to be affected and the others perfectly healthy. The following treatment is recommended in "Disease of Cattle" issued by the Department of Agriculture:

"The aim must be to improve the process of digestion and to supply the animal with a sufficiency of sound and wholesome feed. The following should be given to the cow three times a day, a heaping tablespoon constituting a dose: Carbonate of iron, four ounces; finely ground bone or "bone flour," one pound; powdered gentian, four ounces; common salt, eight ounces; powdered fenugreek, four ounces; mix. In addition to this, three tablespoons of powdered charcoal may be mixed with the feed three times a day, and a piece of rock salt should be placed where the animal can lick it at will."

### Hens' Feet Swollen

What can I do for my chickens? The feet are swollen, red and sore. One hen's feet almost rotted off. I killed her. The head and eyes become affected. They eat heartily to the last. The one I spoke of became blind.—Subscriber, Puente.

I am not given very much to go by in this description. Does trouble begin in the feet or in the legs? What is the course of disease—swelling first, then inflammation and redness,

or vice-versa? Do the bottoms of the feet show any signs of injury, such as might be made by the prick of a tack or a bit of glass, or do they look as if they had been bruised? Trouble in the feet and legs is commonly of two kinds. It may come from rheumatism, which begins in the joints, usually in what answers to the knee joint in human beings, and spreads from there, or it may be what is called

bumblefoot, which is the result of an injury to the foot. In bumblefoot the injury often produces an abscess in the soft part of the foot, which, if unopened, finally infects the leg. You will have to decide which of these causes is at the bottom of the swollen, inflamed condition of the legs and treat accordingly. If there are abscesses in the bottoms of the feet open them and cleanse the cavity thoroughly with peroxide of hydrogen, then put the hen in a clean place, and do not allow her to roost till the wound is healed. If the trouble is rheumatic there is little to be done except to change the surroundings, for rheumatism is almost always due to dampness in house or run and can be cured only by removing to a dry place. Give a dose of Epsom salts, 20 to 30 grains per bird, to clean out the intestines, and the following day add bicarbonate of soda to the drinking water, a teaspoon of soda to a quart of water. It is possible that this trouble is of an ulcerous character. If there are ulcers the case is much more serious, and affected birds should be killed and burned at once. I should like to hear more from the writer about the symptoms and the effect of treatment.—J. A. K.

#### Crown Gall on Peaches

Many of my peach trees are suffering from the so-called crown gall. The gall is prominent near the surface of the ground, and I notice that some of the roots are attacked. What is the cause, and does it spread among other trees? Is the disease in the ground or on the tree when bought at the nursery, and how should I combat it?—Subscriber, Chino.

This is an infectious disease, attacking many varieties of fruit trees, and its spores seem to exist in nearly all soil. The first step in its control is to plant trees entirely free from it, then use care in injury to roots. Where the galls are on the small roots of old trees, cut them off, and where around the crown of the tree, the gall should be chiseled away to clean healthy wood, which should be treated with Bordeaux paste. The subject has been treated very fully in Bulletin 235, which may be had by writing to the University of California, Berkeley.

#### Rough Bark of Quince

I have a quince tree about eight or nine years old. It has rough spots on the bark similar to black knot on cherry trees. Please advise me through the columns of the Cultivator what it is and what if any remedy to use for it and when and how to use.—Subscriber, Upland.

Presumably this condition is that which comes naturally from the growth of the quince. On this point Bailey's Cyclopedia says:

"The blossoms are produced on the current season's growth. A short growth starts from the terminal winter bud, and on the other end of this the flower and fruit are produced. There is no proper stem or peduncle to the fruit, but the quince sits close, or sessile, on a short, leafy branch. The wood growth is continued by an axillary bud of the previous season. This peculiar habit of growth gives the tree its crooked, bunched appearance."

#### Calves on Milk Substitute

Will 12 day old calves do well without milk? What substitute could I feed them? I have good green alfalfa fields for them. — Subscriber, Judson.

It is not easy to raise calves without at least skim milk, and with skim milk care must be used in the feeding of proper substitutes. Would re-

fer the inquirer to answer on page 232 of the Cultivator of February 23. In addition we may say that a little roughage and a little grain are valuable additions to the calves' ration. Here are a couple of mixtures recommended by Larson & Putney's "Dairy Cattle Feeding and Management."

Many grain mixtures have been proposed for dairy calves. The one which perhaps has been more frequently recommended than any other consists of: Three parts corn meal, three parts ground oats, one part linseed meal, one part wheat bran.

A ration which is recommended by the University of Wisconsin consists of: Five parts whole oats, three parts wheat bran, one part corn meal, one part oil meal.

We may also call attention to the valuable proprietary meals and calf feeds on the market, which some dairymen find satisfactory.

#### "Green Ladybugs"

Last year green ladybugs with black spots on their wings attacked my string beans, squash, melon vines, etc. Can you tell us some way to kill them?—Subscriber.

The ladybird, sometimes called

ladybug, is one of our most beneficial insects. They are gathered by the millions in the mountains east of Sacramento and distributed in aphid infested sections of the state where they earned vastly more than their board. There is no "green ladybug," at least the ordinary twelve-spotted cucumber beetle, which is often misnamed ladybug, does not belong to the family of beneficial insects, but is one of our worst pests. But let us keep him straight. "He" is not a ladybug, but a diabrotica, or twelve-spotted cucumber beetle, and any of the family should always be destroyed the instant he appears in the garden, for his family grows rapidly. Use a neutral form of lead arsenate spread over the plants, six to ten pounds of the arsenate to 100 gallons of water.

Never water a horse immediately after feeding grain. This washes the grain through the stomach before it is properly mixed with the stomach juices and is liable to cause colic. It is safer to water the horse before feeding grain.

If you have saved a slice a day, eat corn bread and save a loaf.

## TEST SPECIAL BELTING

*A money-back-belt — no arguments — no quibbling*

Why buy a belt once a year, or more often, when you can get a TEST SPECIAL?—It will save you time, annoyance of costly shut-downs, and increase the amount of power transmitted because there is no slippage.

**A** GOOD belt will last for many years—TEST SPECIAL surely will—money back if it doesn't.

No other belt has ever approached TEST SPECIAL in point of service—no other belt likely ever will—the reason—it is honestly made—most belts are "near belts."

Write to us about your belt troubles—make a rough diagram or drawing of your belt as now installed, if you can do so, otherwise, tell the story as fully as possible.

We'll promptly reply and tell you how to get the best results. You don't have to buy a TEST SPECIAL in order to get our help—you'll be sure to buy one some time, when you know how much money it will save you.

### TREES

**For Sale to Nurserymen or Large Planters.**—Owner of a large block of very fine Eureka Lemon trees will sacrifice at a ridiculously low price to those who will take a large quantity. These are not old dirty culled over stock, but strictly first class trees, clean, thrifty and straight, budded high on sour stock, never have been frosted or stunted in any way. Ground has to be vacated by June 1, so this stock will actually be sold at LESS THAN SEEDLINGS CAN BE RAISED. Address X, California Cultivator.

**For Sale.**—Extra fine Valencia trees, ¾ to 1½, all sour root, high buds, very thrifty, clean and straight, not fertilized, excellent soil for balling, nothing better grown. Can supply a limited acreage yet closing out entire lot of these fine trees. S. R. Coate, 564 S. Los Angeles St., Anaheim, Cal. Phone. Anaheim Pacific 403-J.

**Here is Your Opportunity to Secure A-1 citrus trees.** We offer several thousand 2-year-old lemons; Eureka and Villa Franca, also Washington navel; also several hundred Valencias on sweet root. We call these good trees and we know whereof we speak. ALBERT JACKSON, Upland, Cal.

**For Sale; Citrus Trees.**—Choice stock, young and thrifty. Selected buds, Valencias and Washington Navel, Eureka and Rialto seedless lemon. Marsh seedless grapefruit; also young seedlings. W. W. Burns, 631 Security Bldg., F. 3110, Los Angeles.

**Lemon Trees.**—Special price on first class stock to close out. Large or small orders. Smith Citrus Nurseries, 816 Washington Bldg., Los Angeles, Bdw. 1720.

**For Sale.**—Valencia Orange and Marsh grapefruit trees. Stock propagated only from Performance Record Trees of best type. Trees that will bear and insure profits. Write today. L. V. W. Brown, Riverside, Cal.

**By Far the Lowest Priced means of reaching a buyer for what you have to sell is through classified advertisements in California Cultivator.** The cost is only 1 cent per word per issue, with a minimum of 35 cents.

**Valencia, Orange and Eureka Lemon trees** one year past ¾ to 1 inch. Pedigreed stock on sour root, high buds. We will bud 6000 choice seedlings to your order. Seed bed stock for sale. Randall Bros. Nurseries, Whittier, Cal.

**100,000 Sour Orange Seedbed Trees.**—50,000 sweet; choice new stock. Trees lined out this year sure to hit high market. Better plant a few thousand next spring. Southland Nurseries, 1941 East Colorado, Pasadena.

**For Sale.**—About 20,000 uncultured Navel, Valencias, and lemons at surprisingly low prices. All are highest character of pedigreed stock. Address W. C. Goodno, 397 So. El Molino Ave., Pasadena, California.

Redwood tank, lug hoops, \$135; 1100 gal. redwood, \$19; 1500 gal. \$22; heavy steel galv. barrels, \$6.75; galv. drums, \$4; 30 gal. hot water boilers, \$3.50; 500 gal. corrugated tank, \$19.50; 8000 gal. heavy corrugated galv. tank, \$135; 10,000 gal. heavy corrugated galv. tank, \$175; 900 gal. heavy riveted steel tank, \$68; 5 wagon tanks, \$28 to \$48; new, used redwood and galv. tanks all sizes.

**COMPLETE PUMP OUTFIT; PUMPS** 50 in. at 50 ft.; 3-in. Krogh vertical pump, shaft, 8 hp. engine belt, on cars, \$350.

**COMPLETE PUMPING PLANT**—Fine job only used two years. 8 hp. engine, 20-stroke Buckeye pump, Jack, hardwood rods, 7-in. brass cylinder, 100-ft. 8-in. casing, \$450. Office DEMMITT CO., 120 N. Main, upstairs. Yards, 816 Yale, Los Angeles.

**For Sale**—One 18 h. p. "Olds" distillate engine, mounted on wagon. One 50 h. p. "Olds" distillate engine; one 20 h. p. "Muncie" oil engine; one water well drilling rig; one wooden wagon running gear. The above used machinery may be priced at our shop. Will be sold at a very low figure. Dunn Manufacturing Co., Oxnard, Cal.

**REMANUFACTURED PIPE** All sizes, standard pipe, and wrought iron screw casing. All kinds of fittings. Guaranteed good as new. Write for prices.

**WEISSBAUM PIPE WORKS.**  
169 Eleventh St., San Francisco.

**Gasoline Engines**, the largest stock of used gas engines in California from 2 h. p. to 100. Thoroughly overhauled. Machinery Exchange, 733 North Spring St., Los Angeles.

**For Sale**—One 1918 model Bean Track Pull Tractor, 1-2 gang, 12 inch new John Deere plow. Will sell cheap. J. A. Hall, Del Sur, California.

## AUTOMOBILE ACCESSORIES

Your Ford will use half coal oil or all distillate if you use our 1918 carburetor. 34 miles per gallon guaranteed. One-third more power. Use cheapest gasoline or one-half kerosene. Quickly starts cold motor even at zero and moves right off with full power. No spitting or popping. Slow speed on high. Fits exactly. Attach it yourself. 30 off list where no agents. Big profits selling our goods. We fit all motors. Write for 30 day trial offer and money back guarantee. The Air-Friction Carburetor Company, 313 Madison St., Dayton, Ohio.

## CATTLE

**SHORTHORN CATTLE, SHROPSHIRE SHEEP, Berkshire Hogs** and Shetland Ponies. Get our prices and descriptions before buying. Butte City Ranch, Box C, Butte City, Glenn Co., Cal. W. P. Dwyer and W. S. Guilford, Owners.

**Pedigreed Bull Calves**, Registered \$50.00, unregistered \$25.00. Service bulls \$75 and up. Good individuals from producers. Cows with yearly records at a profit, tuberculin tested. Write or come and select. Horses. N. H. Locke Co., Lockeford, Cal.

**Registered Holstein Bulls** from high producing dams for sale at reasonable prices. Also a few choice females. McAllister Sons, Chino, Cal.

**Venadera Jerseys**, the herd with official yearly records. Calves of both sexes for sale. Guy H. Miller, Route 1, Modesto, Cal.

**Ayrshires (registered)**—A few young bulls, heifers and cows in milk at a bargain for quick sale. A. MacMinn, Phoenix, Ariz.

**Sunshine Farm Jerseys**—Bulls from officially tested dams for sale. E. E. Greenough, Merced.

**Registered Holstein Bulls** of various ages for sale. Millbrae Dairy, Millbrae, Cal.

**Registered Jerseys**—1 yearling bull for sale. J. R. Carhart, Fullerton, Cal.

## THE YUBA BALL TREAD

The Ball Tread is the patented trade name by which Yuba tractors are known. It is different from the track principles used in other flat track machines and has its advantages. The Yuba glides over the smooth steel balls just like a sled on ice. There is almost no friction as the Ball Tread is merely an enlarged ball bearing. The rigid track castings of high carbon steel are the runners of the tractor which glide over the freely rolling steel balls, thus forming the Ball Tread.

One way of demonstrating the frictionless quality of the Ball Tread is to stop the machine with the plow chain taut. Then jump on the chain. The line will slacken and the Yuba tractor will back up—there is no friction to hold it.

The Ball Treads are protected from dirt or dust and are kept well lubricated when the machine is in operation, by oil flowing to them from the track oil box which is secured inside the track. If the raceway of the Ball Tread becomes worn from long continued service, a set of oversized balls can be used. The Yuba track is composed of a series of links joined together by heavy steel pins. The tread shoes are bolted onto these links and are designed to give the greatest tractive power, being reinforced at the point of contact with the ground.

The K-W Ignition Co. Farm Paper Advertisement No. 1A

Owners of tractors equipped with K-W Magnetos find they can fire thinner mixtures and cheaper grades of fuel and still develop full horse-power, than they could by any other system of ignition.

The intense hot spark that a K-W produces gets all the power out of every drop of fuel. It turns the ordinary wasted fuel into extra work *without* cost. A

## High Tension MAGNETO

will start your tractor quickly and easily regardless of weather conditions and will operate on all the low grades of fuel. It gives continuous — no trouble ignition.

Forty tractor manufacturers pay more for K-W Magnetos because they want their users to have the best. K-W Ignition is one of your guides as to quality in your selection of a tractor. Insist that your new Tractor be K-W equipped.

If you are not using a K-W on your present tractor and wish to cut fuel cost — write us. There is a type of K-W Magneto that will do this.

## Brooding Large Flocks

Written for California Cultivator by Jean A. Koethen

**B**ROODING hen hatched chicks is the simplest of all brooding. You give the hen a warm, comfortable coop, and she does the rest. This spring I have put each new brood as it came off in a corner of the feed house. A south window at the floor level gives the chicks a chance to play in the sun, and a partition a foot high keeps them where they belong. The floor is covered with clean dirt for each new brood. After a week in this protected spot they are kept in the open with little danger of chilling.

This, as I said, is the simplest kind of brooding. As the size of the flock increases the problem becomes more complex. When 50 or 100 chicks are to be raised in one flock one of the small indoor brooders is best. Such a brooder may be operated in a shed or feed house or if the weather is not rainy in a lath house. The small brooder stove makes easy brooding if one has a tight, sunny brooder house. I saw several of these little stoves in operation in one brooder house not over 16 feet long. The house was divided into compartments, each running back from the south front, which was all glass, and at the rear of each compartment was one of these little stoves. This gave each brood of 25 chicks its own heat, which could be regulated according to the age of the brood. The day I saw them the littlest, newest brood was cuddled about its warm stove, while the largest chicks found sufficient warmth in the sunshine which poured in at the window. Such a plan as this is excellent for the fancier, who must keep his chicks in small flocks and give each one a maximum of heat and care.

When it comes to brooding chicks by the thousands there are two camps. One holds that the saving of labor is the great thing, and that while there will be greater loss if a thousand chicks are brooded about one large distillate or gasoline stove, the work is done more cheaply and therefore more efficiently in the end. The other puts the life of the chick and its rapid growth and development above everything else, and continues to brood in small flocks in spite of the additional labor.

The plant of Scofield and Olsen at Van Nuys is one of the best equipped of the first class in Southern California. Here 1000 chicks are brooded about one big stove, and so carefully has every detail of comfort and ventilation been looked after that few chicks fail to reach broiler size.

The brooder house is 24 feet square and is built of the best matched lumber. It is divided into two rooms, each 12 by 24, and these two rooms are again divided into two, each 12 by 12. The rear room is the brood room, and the one in front, which is mostly glass and wire on the south, is the play room. A small door connects the play room with the outside run. The house has therefore two brood rooms and two play rooms, and is intended to accommodate 2000 chicks, 1000 on each side.

The brood room is floored with cement, and the walls are lined with asbestos paper so that there can be no danger of fire. Corners, into which the chicks might crowd and pile up on one another, are eliminated by slanting the cement floor up for two or three inches where it meets the corner of the room. The two

small windows are near the ceiling and the air is kept pure by a ventilator in one corner connecting with a ventilating duct under the floor. The first day or so the chicks are kept close about the big stove by a fence of inch mesh wire, but this is soon removed, and the chicks are free to find a temperature which suits them, whether in the brooder room or farther from the stove in the big sunny play room. The floors of both rooms are covered with several inches of fine straw, which gives the chicks abundant opportunity for scratching as well as a soft bed to sleep on.

As this brooder house is not only a nursery for the chicks but must serve also as a home for the pullets till they are nearly grown, it is supplied with roosts as well as with brooding facilities. When the baby chicks are put in the brooder room, the roosts, which are 3/4 inch slats nailed 3/4 inch apart on a frame of light timber, are put up against the wall. After a few weeks, when the chicks near the roosting age, these frames are dropped. As one side of the frame is fastened permanently to the wall about three feet from the floor, when the other side touches the floor near the stove the whole frame rests in a slanting position on the straw, and the effect of the three frames rising from the floor to the wall on three sides of the stoves is not unlike that of an amphitheatre. This gives the chick which is ready or nearly ready to roost the choice of straw bed on the floor, low slat or high perch for the night, and soon every chick is roosting as high as possible. As they near broiler size the little cockerels are removed to the fattening coops and the pullets are left in possession.

An equally good example of brooding in small flocks may be seen on the poultry plant of C. R. Brown, president of the Arlington Poultry Association. Mr. Brown's brooder house is 40 feet long and about 20 feet wide. An alley runs through the center, separating the little chick runs, which are 2 1/2 feet wide and eight feet long, from those designed for the older chicks, which are five feet wide and eight feet long. As the hot water brooders are ranged along this central alley, nearly all necessary care may be given the chicks without entering the runs. A door from each indoor run opens into the outdoor run of the same size, so that the chicks have the choice of the well heated brooder, the cooler play room or the outdoor air. As they come from the incubators the chicks, 100 in a flock, are placed in the small runs along the east side of the house. As they outgrow these runs and the 100 chick brooders which hover them, they are moved to the wider runs on the west side, and are provided with larger brooders until they are able to do without heat. Mr. Brown believes that chicks can be better cared for in lots of 100 than in larger flocks. This house has accommodations for 3200 chicks. The day I was there, which was early in February, it contained

2600, the oldest 24 days old, and he expected to fill it again in March or April.

Mr. Brown's system of feeding is unusually simple. The nursery feed for the first day in the brooder consists of rolled oats. The second day a mixture of Indian corn and milo ground together is set before the chicks, in a hopper, and this, with a hopper of the purest beef scrap obtainable, is their fare until the cockerels are removed to the broiler

## Care of Sitting Hen

**T**HE kind of care and attention given a sitting hen during the process of hatching eggs plays an important part on the number and condition of the chicks when hatched. See that the hens are made comfortable on the nest; allow them to come off only once a day to receive feed and water. If there are any that do not desire to come off themselves, they should be taken off. Hens usually return to their nests before there is any danger of the eggs chilling, but if they do not go back in half an hour in ordinary weather, they should be put on the nest. Where a large number of sitters are kept in one room it is advisable to let them off in groups of from four to six at a time.

### Keep Eggs and Nests Clean

The eggs and nests should be examined and cleaned, removing all broken eggs and washing those that are soiled; in the latter case the soiled nesting material should be removed and clean straw added. Nests containing broken eggs that the hen is allowed to sit on soon become infested with mites and lice, which cause the hens to become uneasy and leave the nest, often causing the loss of valuable settings of eggs. In mite-infested nests, the hen, if fastened in, will often be found standing over rather than sitting on the eggs.

Many eggs that are laid in the late winter and early spring are infertile. For this reason it is advisable to set several hens at the same time. After the eggs have been under the hens from five to seven days, the time depending on the color and thickness of the shells—white shelled eggs being easier to test than those having brown shells—they should be tested, the infertile eggs and dead germs removed, and the fertile eggs put back under the hen. In this way it is often possible to put all the eggs that several hens originally started to sit on under fewer hens and reset the others. For example, 30 eggs are set under three hens at the same time, ten under each. At the end of seven days we find on testing the eggs from all the hens that ten are infertile, which leaves us 20 eggs to reset, which we do by putting them under two hens, and have the remaining hen sit over again after she has sat only seven days. In this way considerable time can be saved in one's hatching operations.

### Protect Sitting Hens from Mites and Lice

In order to secure greatest success and make the hens comfortable when they are sitting, great care should be taken to keep the nests free from mites. To do this effectively is not an easy task. If oil from crude petroleum, which is good for controlling mites, is sprayed freely about the house at that time it may soil the eggs and prevent successful hatching. Infested quarters, therefore, should be treated thoroughly before hens

coops and the pullets to their house. At the Scofield and Olsen ranch Co-operative chick mash and chick feed are placed before the chicks the first day and are kept before them till they have learned to eat. After this the chick feed is fed in litter three times a day and the mash kept before them till the middle of the afternoon, after which time they are expected to fill their crops with hard grain. All the greens the chicks will eat are given after the third day on both plants.

are set, so as to start them in nests which are absolutely clean. Beneath the straw of the nest a layer of lime and sulphur will tend to prevent mite breeding, and the entire nest may be dusted occasionally with pyrethrum. Broken eggs and the straw soiled by them should be removed promptly, as they tend to attract mites.

Medicated nest eggs, said to control poultry lice, are on the market. These consist largely of naphthalene. While this material will destroy lice when applied generally to the fowl, it is injurious to the hen's eggs as well as to the bird. If used in quantity, or if the medicated eggs are allowed to remain for some time beneath a hen, she may die as a result. Sodium fluorid powder, dusted on the fowl, or dissolved in water and used as a dip, is the best remedy for lice.

## Storrs Egg Laying Contest

Storrs, Conn., March 27, 1918. Report for the twenty-first week ending March 27:

The total production for the 1000 hens in the laying contest at Storrs amounted to 4339 eggs for the twenty-first week. This figure represents a production of 62 per cent, and while not quite as good as the production in the corresponding week last year, is still 44 eggs greater than the average for the last four years. First place for the week was won by Richard Allen's Rhode Island Reds from Pittsfield, Mass. with a production of 58 eggs, thus establishing a new high record for the present contest.

It is perhaps significant that there have been few pens of Leghorns among the leaders during the past few weeks. The combined data of the previous four contests show that the Rhode Island Reds have outlaid the other breeds during the months of February and March, while the Leghorns have been at the bottom of the list in average production. During April we may expect the Leghorns to rise quickly to first position and if they follow previous records, they will hold first place until the end of August.

The three best pens in each of the principal varieties are as follows:

### Barred Plymouth Rocks

Jules F. Francais, 720; Tom J. Adam-

son, 665; Rock Rose Farm, 657.

### White Wyandottes

Obed G. Knight, 793; Brayman Farm, 664; J. Frank Dubois, 652.

### Rhode Island Reds

Richard Allen, 736; Pinecrest Orchards, 640; Chas. H. Lane, 614.

### White Leghorns

J. O. LeFevre, 689; A. P. Robinson, 660; Braeside Poultry Farm, 653.

### Miscellaneous

Cook & Porter, (Buff Wyandottes) 706; Ore. Agricultural College (Ore-gons) 696; H. P. Cloyes, (Buff Wyandottes), 604.

### PRESERVE EGGS

Save eggs during April and May for winter use by preserving in water-glass.

Mix nine quarts of water, boiled and cooled, with one quart of waterglass. Will preserve 15 dozen eggs.

Place the solution in a five gallon jar. Store in cool place for winter use.

Eliminate the male bird at the end of the hatching season. Fifteen million dollars is lost each year by allowing the rooster to run with hens during the summer months. Product the infertile egg. Dispose of the male bird not later than June 1. Market a better quality of eggs.

RICE

By agreement between the growers and millers of rice and the food administration, prices for California rice have been fixed as follows: Paddy rice, \$4.10 per 100 pounds to the growers; cleaned rice, \$7.10 per 100 pounds from the mills to the trade, and \$8.00 per 100 from jobbers and wholesalers to the retailers.

HAY

Under date of April 6, Scott, Magner & Miller says:

Receipts, past week, 1150 tons. As there is now plenty of grass all over the country for stock feed the feeding of baled hay in the country districts has practically ceased and with few exceptions, which are mostly orchard districts, there is no call for hay at the present time.

Reports just received from some of the early hay districts are that they will be cutting first crop alfalfa within two weeks. The government seems to be well stocked in all cantonments and in all probability will not require much hay before new crop is available.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the market. For prices to consumers charges of cartage, commission and handling must be added according to conditions.

Citrus Fruit Market

Los Angeles, April 10, 1918.

Both oranges and lemons are commanding exceptionally long prices. Some soft stock has been put on the auction, which accounts for the few disastrous prices. All good fruit is cleaned up as soon as offered.

Shipments

Cars of citrus fruit from California since November 1, 1917: Southern California, oranges, 6880; lemons, 1792; total, 8672. To same date last season: Oranges, 17,520; lemons, 2983; total, 20,503. From Central California: Oranges, 2164; lemons, 113; total, 2277. To same date last year: Oranges, 4055; lemons, 164; total, 4219. From Northern California: Oranges, 203; last year same date, 344.

Boston: 8 oranges, 2 lem. Nav. 2.10-6.20, Seed. 4.35-5.00, lem. 1.55-4.20.

MARKET NOTES

The crop reporting board estimates the amount of corn on farms of the United States, March 1 as 1,292,905,000 bushels. This is about 40 per cent of the entire 1917 crop. The amount on hand the preceding year same date was 782,000,000 bushels.

The amount of wheat on farms on March 1 was 111,000,000 bushels, which was about 17 per cent of the 1917 crop. The year preceding there were an even 100,000,000 bushels, which was only 15 per cent of the 1916 crop.

The inspection division of the bureau of markets has opened headquarters in the city of Los Angeles.

New York market is being glutted with eggs and prices have begun to break. The trouble has been caused by ruling of the food administration which some of the markets have maintained could not be enforced.

Estimated weights of orange boxes in shipping have been raised from 72 to 73 pounds and of lemons from 84 to 90. This will result in an increased weight per car of 2772 pounds.

PARTIAL LIST OF CALIFORNIA SHIPMENTS

From post card reports to the bureau of markets, United States department of agriculture, Miss Hoey makes report of the following shipment of cars of products from California for the week, April 1 to 8: Apples, 4; artichokes, 35; asparagus, 56; cabbage, 62; cauliflower, 37; celery, 23; fresh peas, 5; dried apples, 3; dried apricots, 3; dried beans, 10; dried peaches, 11; dried pears, 1; dried prunes, 33; lettuce, 38; mixed vegetables, 85; mixed fruit, 5; onions, 10; potatoes, 32; raisins, 23; rhubarb, 25; dried peas, 2; turnips, 1; Mexican tomatoes into the state, 22.

RED CROSS CALVES AND SEPARATORS

One of the interesting new features of the University Farm Picnic on April 20, will be an auction sale of two pure bred dairy bull calves and of two farm cream separators, the proceeds of which will be turned over to the Red Cross Society. The Jersey bull calf was donated for this purpose by C. G. McFarland of Tulare; the Ayrshire calf by E. B. McFarland of San Mateo, and the two hand separators by the Empire Cream Separator Company and the International Harvester Company of America, of Bloomfield, New Jersey, and San Francisco, respectively.

## They Win on the Roads You Drive on

**AJAX**  
Shoulders  
of  
Strength

## AJAX TIRES

### Dirt Track Champion of America

These same winning Ajax Tires, successful on dirt tracks at high speed, will be equally successful for you on your roads at your speed.

Dirt tracks are the same road-bed as the country roads surrounding them. Success on dirt tracks means service on country roads.

AJAX TIRES on proved performance, are the money-saving, mileage-giving tires for the farmer.

### SHOULDERS of STRENGTH

The picture shows these supports built into Ajax Tires on both sides of the tread, giving them more tread on the road—more rubber where it should be. They give longer life to Ajax Tires because road friction is thus distributed evenly over the tread. On Ajax Tires there can be no centering of friction in one spot to wear through to the fabric.

### AJAX ROAD KING

"More Tread on the Road"

Ajax Road King proves its superiority in competition with other tires, ON THE ROAD. Built for city streets or farm highways. Ajax Road King has "more tread on the road" than other tires. Note its triangle barb tread—an added safety factor.

#### 97% Owners' Choice

is a practical endorsement of Ajax quality unequalled by any other large tire manufacturer. This huge percentage of Ajax output is the choice of car owners to replace other tires that came on their cars. All Ajax Tires—and Ajax Inner Tubes—give real service. Write for booklet on Ajax Shoulders of Strength.

AJAX RUBBER CO., Inc., 1796 Broadway, New York

## Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

### Who Pays Taxes?

In making a deed to real estate after March 1, who is to assume the taxes, the owner or the purchaser?—Subscriber, Orland.

It is entirely a matter of agreement, just as the assumption of any other encumbrance. If there is a grant deed with no mention of the taxes the purchaser would be entitled to recover the amount paid against the grantor as the taxes become a lien upon the property at noon on the first Monday in March of each year. Frequently the deed mentions the taxes and the purchaser pays them when due.

### Dog Killed

My dog following me on the public road, bites a man without provocation. He kills the dog. What are the rights of the parties?—Subscriber, Claremont.

Unless the owner of the dog knows that he is vicious and it can be proven that he has knowledge of that fact, there is no liability. The old saying is, "A dog is entitled to one bite." A person may justifiably injure or kill a dog in self defense, but the danger of being bitten must be imminent. It has been held both ways that a man is and that a man is not justified in killing a dog which has bitten him. I doubt that any court would in such instance award damages for the value of the dog.

### Damage for Killing Dog

A man catches my dog killing a chicken in his yard. Have I any redress if he kills my dog? Could he get damages for his dead chicken?—Subscriber.

The general rule is that a person is justified in killing a dog in defense of the property of the person and then only if the property endangered was worth enough to justify the killing and the killing was the only means of saving the property. He had no right to kill the dog after the dog killed the chicken; that was simply revenge. The chicken owner could recover the value of his chicken and you should recover the value of your dog.

### Wife's Share in Property

Real estate stands in the name of husband and wife, to the purchase of which the wife has contributed from individual gifts to her. Could either the husband or wife sell this property without the consent and signature to deed by the other?—Subscriber, Santa Rosa.

In the case stated, the property is not only community property, but each of the parties holds an undivided interest in the whole of the property as they are what is technically termed "tenants in common." Neither could without the signature of the other convey clear title to the land. Each has the right to occupy the whole of the land. The husband's interest would always be subject to proof of the wife's separate interest.

### Voting by Proxy

What is status of a proxy in a corporation, say such as a cooperative marketing or purchasing association not conducted for profit, or fraternal or church organization? May proxies be given by members? May there be a provision inserted in the by-laws which will prevent the use of proxies by members? Also may proxies be given by trustees or directors to be

used in meetings of the directors?—Subscriber, Los Angeles.

The rules with respect to all non-profit organizations such as those above named are quite different from the usual profit corporation. The law of this state with respect thereto is exceedingly vague. The general provision is that such corporation may prescribe in its by-laws the persons who may act as proxies for members and the length of time for which such proxies may be executed. Under the heading of religious organizations the provision reads that the manner of voting may be in any manner provided by the by-laws and that the rules and discipline of the church shall be considered a part of the by-laws. Under cooperative business organizations a provision is made that the by-laws may provide for forwarding the ballots of the members by mail or otherwise and that such by-laws may provide for the mode and manner of conducting elections. Under cooperative agricultural associations the by-laws may determine the whole question of voting by proxies. And generally under non-profit cooperative corporations the by-laws may determine whether the voting power of each member shall be equal or unequal and may fix and determine rules applicable to the voting power, property rights and interests of the members. On the other hand the trustees or directors of a corporation are the delegates or agents of the respective stockholders or members, and the general rule applicable to all agents chosen for their personal qualities is that they cannot delegate their power to others.

### Transfer of Stock

A year ago I sold my stock in a California corporation, filled out the transfer on the certificate and delivered it to the purchaser and received my money. The purchaser has never transferred this stock on the books of the corporation. Am I still a stockholder? As the corporation is bad off would there be a liability in case of failure?—Subscriber, Inglewood.

The transfer is not valid, except as to the parties thereto until the same is entered upon the books of the corporation so as to show the name of the parties by whom and to whom transferred, the number of the certificate, the number or designation of the shares, and the date of transfer. Thus as to any creditor you are liable for your proportion of the debts incurred while your name shows as a stockholder.

### Contract for Sale of House

X is owner and vendor of bungalow which he sells to A on installment contract. If the bungalow burns is the contract extinguished or must X replace the bungalow for A? Insurance is carried as the interests of the vendor and vendee may appear at the time of fire. Could the insurance be divided equitably and the contract extinguished or could A require the seller to rebuild if A had not much equity if X would pay the equity?—Subscriber.

For the purposes of the above question the practical status of the vendor and vendee is that of mortgagor and mortgagee and X has no concern with what happens to the property other than that his security may be impaired, and the personal responsibility of A for the balance due over the value of the lot may be negligible. Therefore, unless the contract otherwise provided, X could enforce the personal obligation of A in the contract first against the remaining lot and then any other property of A, nor would he be required to rebuild. X could also require the balance due him to be paid out of the insurance collected; the exact form in which he would go about collecting the insurance would depend upon the form of the policy. Of course X and A could make any contract with respect to the matter which would be agreeable to both, but that would be a new contract and not dependent upon or arising from the direct provision of the old.

## THE SERVICE FLAG

Dear little flag in the window there,  
Hung with a tear and a woman's  
prayer;  
Child of Old Glory, born with a star—  
Oh, what a wonderful flag you are!

Blue is your star in its field of white,  
Dipped in the red that was born of  
fight;  
Born of the blood that our forbears  
shed  
To raise your mother, the Flag, o'er-  
head.

And now you've come, in this frenzied  
day,  
To speak from a window—to speak and  
say:

"I am the voice of a soldier son  
Gone to be gone till the victory's won.

"I am the flag of the service, sir;  
The flag of his mother—I speak for her  
Who stands by my window and waits  
and fears,  
But hides from the others her unwept  
tears.

"I am the flag of the wives who wait  
For the safe return of a martial mate,  
A mate gone forth where the war god  
thrives  
To save from sacrifice other men's wives.

"I am the flag of the sweetheart true,  
The often unthought-of—the sisters,  
too.

I am the flag of a mother's son,  
And won't come down till the victory's  
won!"

Dear little flag in the window there,  
Hung with a tear and a woman's  
prayer;

Child of Old Glory, born with a star—  
Oh, what a wonderful flag you are!  
—William Herschell in the Indianapolis  
News.

## MARINDA'S SLICKIN' UP

**W**HEN the Brown place was sold for four thousand dollars it was the talk of the town. Some called Brown lucky, others termed him a sharper, and nearly everybody agreed that the purchaser was a "numskull with more money than brains." But by the by the Brown place began to blossom out, and in the course of a few months was the pride of the town. Old fences came down, stumps were removed, flower-bordered walks appeared as if by magic, and tidiness was everywhere apparent. No great amount of money was expended, but system was adopted, and every little change brought out the beauty that had so long lain hidden in the old homestead. The Browns had begun by "slicking up" and it only remained for the new comer to make the place artistic.

It had long been Jared Fuller's hope to sell out at a figure that would enable him to purchase a small place in the village, and have enough left over to keep him from want the remainder of his days. He was well along in years, and his hundred acre farm was fast becoming an elephant on his hands. Mrs. Fuller was no longer able to do the work of the dairy, and with Marinda away from home the greater part of the year the old couple longed for the few conveniences the village afforded.

"Ef we only had a leetle house down street, with an acre uv ground, a few hens an' a leetle money in the bank we could git erlong amazin' well," he was wont to say, but no purchaser came, while the fences leaned further and further, and many of his farming tools rotted down in the dooryard.

During the winter of the coal famine, many shade and fruit trees around the house had been sacrificed, the stumps of which still stood high and unsightly. The wood pile, with its attendant litter, had spread and spread until it covered half of the back yard, and was a blot on the landscape viewed from the road.

All this untidiness jarred upon the finer nature of Marinda Fuller during her vacation visits, and though she expostulated with her hard-headed father it was to no purpose.

"Them's city notions," he would say, and the grass grew tall in the front yard, and the trellises fell from the weight of the climbers.

When Marinda came home the following summer she was full of determination. She had come two weeks earlier than was expected for the purpose of getting things in order for the arrival of her city friend. It was to be a case of father's will against daughter's, and she had already decided as to how her battle was to be waged. She was scarcely more than

seated in the old family wagon when she fired the opening gun.

"Mother writes that the place looks more run down this spring than ever," she ventured.

"Waal, I dunno how it's goin' to be helped, I an't got no time nur money to fritter away on sech things ez that," returned the farmer rather dejectedly.

"An hour or two a day would do a lot toward fixing up a place, father."

"Yaas, but I don't hev that hour or two an' never hev an' never will; the place is all right fur what I git out uv it. I ain't a bit better off than I wuz when I started in 30 years ago, an' ef they any fixin' up done somebody'll hev to do it besides me," and Jared Fuller pulled his hat brim far down over his eyes apparently to protect them from the glaring sun, but more especially to hide their moistened depths from the gaze of his daughter.

"Father," Marinda began, after a moment's silence, "may I fix the place up myself? I—I've got a friend coming up from New York in about two weeks, and I'd like to—to make it a little more presentable."

"Yew fix it up?"

"Yes, me, father; that's why I've come ahead of time."

The old farmer eyed his daughter critically. He saw that she meant business, and his strong will gave way a little. He spoke with much deliberation.

"Waal, ef yew've got any money to throw away on the ol' ranch, why I dunno's I've got any objections, but I want yew to jest bear in mind, Marinda, thet I shan't lift a finger nur furnish a cent."

"And you won't object to anything I do so long as I don't injure the property or inconvenience you with your farmwork, father?"

"No, go ahead an' stick it up to suit yerself," and Jared Fuller heaved a sigh of relief now that his consent had been given, and his hands were clear of any part of the proceedings.

By this time they had reached home, and after greeting her mother, Marinda lost no time in getting her plans under way. She engaged a painter to give the house one coat of paint, bought a lawn mower, and secured the services of big John Fales, and his boy to work around the place for two weeks. Scythes began to swing across the front yard, and a cut path led to the front door. The old, unsightly fences were carted away, and the 18 inch wall that separated the lawn from the highway, was neatly whitewashed. Every stump was dug out, the ground levelled, and turfed over. The farming tools were housed in hastily improvised sheds, and two artistic pillars built of field stone ornamented the driveway entrance. The old woodpile was moved to a more suitable spot, and in its place a flower bed was spaded. The front veranda was put in repair, and a hammock swung invitingly over its floor. Across the road trees were trimmed and underbrush removed so that a view could be had of the river that wound prettily through the valley.

At the end of two weeks Marinda had gone as far as her limited means would permit, but the transformation of the "Fuller place" was truly wonderful, and Marinda's father was forced to admit that he "felt more like he wuz visitin' some uv his well t' do relations than livin' to home."

At length the long looked-for day arrived when Marinda's friend was expected. Much to the surprise of her parents, an athletic, well-dressed man of about 35 sprang from the wagon, when Marinda drove up in front of the house. A tell-tale blush stealing into her cheeks when she introduced the visitor as Doctor Forrest, of the hospital, told her father and mother that a pretty love story was undoubtedly woven into her hospital experience.

"Marinda," said Doctor Forrest, a few nights later, as they lingered under the moon-lit veranda, "this is an ideal spot up here; just the kind of a place I have longed for for years in which to spend my summers. I have fallen completely in love with it."

"Would you care very much if the homestead passed from your father's hands into mine, or rather 'ours,' for I hope to claim these as my own be-

## After a Hard Day's Work—

WITH the chores done, the stock tended to, everything ship-shape and air-tight for the night—

It's pretty nice to settle down to supper with a steaming cup of Ghirardelli's at your elbow. Pretty nice and warm and comforting!

And in the morning—up early (what with help so scarce!) and a hundred and one things to do—it's right comforting to know that Ghirardelli's will be there at the breakfast table to greet you.

A delicious, sustaining food-beverage—drink it every day for health and economy.

In  $\frac{1}{2}$  lb., 1 lb. and 3 lb. cans; a  
tablespoonful—one cent's worth—  
makes a cup.

## The Spirit of War Service

Alone in the midst of war's desolation, the telephone line-man crawls to mend the broken wires.

On all sides the thunder of artillery; in the air bursting shrapnel.

He faces danger with that unconquerable spirit of war service which permits him to think only of maintaining the telephone connections.

The safety of the troops depends on these lines of communication, often used for the sentries' warnings, the carrying of official commands and the

summoning of reinforcements.

In a dark hole hidden among sparse brushwood are the telephone operators, some of whom have been for months in their damp cave ceaselessly swept by shells.

And they are admirable, all these heroes of the Signal Corps, whether serving in darkness or in the all too bright light of day.

The spirit of war service, over here as well as over there, furnishes the nerves, the endurance, the morale—the stuff that wins war.

fore we leave this Eden again?"

"I know that father desires to sell the farm and live in the village, but I—I never thought of parting with the old place; it has grown very dear to me," she replied, with much feeling. "But you won't part with it, my dear, it will be ours; yours, forever. It shall be one of your wedding presents. I know all about what you have done up here in the way of beautifying the place, and I love you for it. We have talked it all over, your father and I, and have settled upon price and everything. He is happy over the result, and so am I. Are you satisfied, little girl?"

And without her uttering a single word he knew that she was.—Green's Fruit Grower.

### TO BE HAD FOR THE ASKING

A series of ten leaflets telling how to use to best advantage potatoes, corn meal, oatmeal and other foods which we find it necessary in these days of war necessity to use largely, may be had by writing to Food Administration, United States Department of Agriculture, Washington, D. C., and asking for United States Food Leaflets Nos. 1 to 10. The titles of the leaflets are: Start the Day Right with a Good Breakfast, Do You Know Corn Meal? A Whole Dinner in One Dish, Choose Your Food Wisely, Make a Little Meat Go a Long Way, Do You Know Oatmeal, Food for Your Children, Instead of Meat, Vegetables for Winter, Plenty of Potatoes. It is not necessary, however, when requesting the leaflets to send the titles, simply ask for Nos. 1-10.

From "Plenty of Potatoes" we take the following recipes:

#### Potato Corn Meal Muffins

Two tablespoons fat, one tablespoon sugar, one egg, well beaten, one cup milk, one cup mashed potatoes, one cup corn meal, four teaspoons baking powder, one teaspoon salt.

Mix in order given. Bake 40 minutes in hot oven. This makes 12 muffins. They are delicious.

#### Potatoes Good in Cake

They are often used in this way to keep the cake from drying out quickly. Mash the potatoes and beat up with milk until very light. You can use your usual cake recipe, substituting one cup of mashed potatoes for one-half cup of milk and one-half cup of flour.

#### Potatoes for Your Main Dish

Potatoes, left over or fresh, may be combined with cheese or nuts or meat or other material, often to make the main dish of a meal.

#### Potato Sausages

One cup mashed potatoes, one cup ground nuts, fish or meat, one egg, well beaten, one-eighth teaspoon pepper, salt pork, bacon or other fat.

Mix the mashed potatoes and seasonings with the ground nuts, fish or meat. Add beaten egg. Form into little cakes or sausages, roll in flour and place in greased pan with a small piece of fat or salt pork on each sausage. Bake in a fairly hot oven until brown.

#### Scalloped Potatoes and Cheese

Arrange a layer of sliced raw or boiled potatoes in greased baking dish and sprinkle with grated cheese and a little flour. Repeat until dish is nearly full. Pour milk over the whole, about one-half cup to every three potatoes. Skim milk is good. Bake in a moderate oven until done. The length of time required depends upon whether the potatoes are raw or boiled and whether the baking dish used is deep or shallow. Boiled potatoes baked in a shallow dish will take only 20 minutes. Raw potatoes in a deep dish may take as much as 1½ hours.

#### A Shepherd's Pie

Grease a baking dish; cover the bottom with mashed potatoes. Add a layer of cooked minced meat or fish, seasoned well and mixed with meat stock or gravy. Cover with mashed potatoes. Bake long enough to heat through—20 to 30 minutes.

Try a rye-bread cottage cheese and tomato catsup sandwich. It will give your palate a thrill, one you'll probably repeat.

Has your dollar gone to the Red Cross?

### HOME GROUND CORN MEAL

A Suggestion from the Island of Jamaica

"I have made corn meal with my coffee mill that would make some of the imported corn mills feel ashamed. This is how I do the thing: First, I have the mill properly cleaned with hot water and dried. Then I screw it down so that the corn comes out in coarse grit from the first grinding. Secondly, I screw it up to three-quarter tight, and pass the grit through which should come out nearly done. Thirdly I screw up as tightly as possible, return meal to mill and the result is that after sifting I get as fine meal as could be desired. Again, if I desire to have a real good plate of pea soup, all I have to do is to pass the peas through the mill before cooking, and the result is marvellous. I have not tried it with banana or potato chips, but I feel confident that the same results can be obtained. Of course, it takes up more time and labor than the corn mill, but the results pay when you haven't got a corn mill of your own or one near by.

There are latent possibilities of helpfulness in children that some mothers never discover. The child will love and take pleasure in doing the tasks assigned him if the right attitude toward work is taught and freedom of imitation allowed as far as possible. The little girl will dust and tidy the living room more joyously if she be permitted to arrange the rose bowl and flower vases to suit her taste and make the few little changes in furnishings that she considers more artistic.

Genuine comfort if you ask for and get—

# LACTEIN

## For Chickens and Hogs

Lactein is condensed buttermilk and for feeding chickens and hogs equals the best buttermilk at a cost of about one cent a gallon. It will positively produce more chickens, more hogs, more eggs, more pork and more money.

LACTEIN is a scientific product produced under perfect sanitary conditions from fresh buttermilk and whey at the creameries, cheese and casein factories of California.

### BUTTERMILK IS 91 PER CENT WATER

Buttermilk contains 9 per cent solids and 91 per cent water. Whey contains 6 per cent solids and 94 per cent water. The solids of both buttermilk and whey, and especially whey, are very rich in the one greatest tonic known for chickens, **LACTIC ACID**. They are also rich in protein (albumen and milk sugar or carbohydrates). LACTEIN is produced by separating the water from the solids at a temperature and in a manner that not only thoroughly Pasteurizes and sterilizes the solids, but retains and stimulates the Lactic Acid, which in buttermilk is practically lost if either brought to a high temperature or reduced to a dry state.

### LACTEIN IS BUTTERMILK WITHOUT THE WATER

LACTEIN retains all the health-giving food values and a uniform acidity without the useless bulk of water encountered in either whey or buttermilk, and will keep pure and fresh under any condition or in any climate for any length of time.

### LACTIC ACID IS A TONIC

For years the greatest poultry experts in the world have recognized the value of sour milk as a food tonic—a regulator for poultry and hogs, but when they have undertaken to use raw buttermilk have run up against objections which more than offset the many advantages for its use in feeding. In the main these objections were the excessive cost, inconvenience, trouble and expense of handling, and the poor keeping qualities. LACTEIN eliminates every objection to the use of raw buttermilk and reduces the cost to a mere trifle.

### ONE GALLON LACTEIN EQUALS FIFTY GALLONS BUTTERMILK

One gallon of LACTEIN, when mixed with 49 gallons of water, has a tonic and food value for chickens or hogs equal to fifty (50) gallons of the best buttermilk and will give better results than 50 gallons of raw buttermilk when fed according to our directions, not to mention the convenience in handling and the saving in price. LACTEIN is prepared by the chicken raiser in this manner each day in the amount required and fed as drinking water or in mash feed or both, but the best results are obtained by feeding one part LACTEIN to 30 parts water. This gives almost double the value of raw buttermilk.

### DRUGS NO VALUE TO CHICKENS OR HOGS

Everyone knows healthy chickens produce healthy profits and the other kind do not. To produce healthy chickens the eggs must come from healthy hens and the leading scientific authorities recognize the fact that no drugs yet discovered have proven practical for treating diseased chickens, also that it is more easy as well as more profitable to prevent disease than to cure it.

### LACTEIN IS A POSITIVE PREVENTATIVE

The Kansas City Farmer says: "Scientists have found in buttermilk the greatest foe of the bacteria to be found in the large intestines of chickens. Since practically all poultry diseases, aside from roup, are intestinal, **THIS FACT IS IMPORTANT**. When buttermilk is fed regularly to poultry the mortality is much less, and if young chickens are fed on it from the start it prevents white diarrhoea."

The California State Agricultural College says: "Disease in chickens may be controlled by feeding buttermilk and it has the added advantage of being an excellent food. In fact every effort should be made to obtain it."

### LACTEIN INCREASES GROWTH

The Agricultural College of Wisconsin says: "A pound of protein from cornmeal is not equal to a pound of protein from buttermilk in making growth. In fact it has been proven if the cereal grain proteins are used as the sole source of proteins they will show an efficiency of less than 30 per cent,

while the proteins of buttermilk will reach 65 per cent. In other words, only 30 per cent of a pound of protein from the grain would be stored away while the buttermilk will give 65 per cent. Buttermilk is therefore a more superior article as a rational diet for chickens, hogs or for human consumption."

### LACTEIN ASSURES MAXIMUM EGG PRODUCTION

It is not how much you feed your chickens, but how much you feed that is assimilated—**THAT MAKES FLESH AND EGGS**—that counts. LACTEIN makes the feed you are now using worth more by increased assimilation. It will make your flock healthy and vigorous, an absolutely necessary condition to a maximum egg production. Since wheat cannot now be used for chicken feed, it is most necessary to not only make the less desirable feeds palatable to the chicken, but increase the assimilation if the egg and flesh production are to be maintained or increased. LACTEIN will do it.

### LACTEIN PREVENTS DISEASE

It not only prevents the many distressing diseases known to poultry, but it provides an even greater service as a fattener and egg producer by aiding digestion, improving appetite and increasing assimilation. Its use will positively bring a greater and more rapid growth of every fowl in the fattening pen, build firmer flesh, add wonderfully to the general vitality of the entire flock and, owing to its excessive nutritive qualities, makes record layers of hens that previously were very poor egg-producers.

### LACTEIN SAVES THE BABY CHICKS

LACTEIN will cut your heaviest losses 90 per cent in baby chicks. It prevents the dreaded white diarrhoea and will show a much more rapid growth in weight than for chicks given the same food without LACTEIN. This has been proven many times. LACTEIN is equally valuable for the entire feathered family, turkeys, ducks, geese, pigeons, etc. It not only prevents losses and increases profits, but it lightens your labors.

### FEED LACTEIN TO HOGS

LACTEIN is equally valuable as a food for hogs. It stands to reason that if buttermilk is a good appetizer and tonic for hogs, LACTEIN is even better because the acidity of the LACTEIN is always the same. Feed it to hogs in their swill water or other feed and watch them grow. A few pounds more of pork these days makes a big difference in the profits.

### WE GUARANTEE LACTEIN

We do not want your money unless you feel that LACTEIN is all we claim it to be. We will promptly refund your money if it does not do all that is claimed for it, when directions for using are carefully followed. Every gallon of LACTEIN is sold under these conditions, and we have yet to find a customer who has asked to have his money refunded, but have many letters similar to the following:

Mr. O. J. Rogers, a real estate dealer and chicken raiser of Modesto, Cal., writes: "I began feeding your LACTEIN milk food to my chickens about three months ago and am well pleased with the results. In fact, would not think of being without it for a single day. About a month ago, I discontinued its use for ten days and my egg production dropped from 60 to 38 per day. I changed the grain feed, but got no increase in eggs and then began feeding LACTEIN again and am now getting 68 eggs per day, or nearly double the number that I got without it. I consider LACTEIN both a tonic and a food for chickens. It not only prevents sickness, but seems to increase assimilation and gives more food value to the other food. It sure keeps the chickens in fine, healthy condition."

### LACTEIN IS A BODY BUILDER

LACTEIN is a tonic, appetizer, liver and bowel regulator, body-builder and egg-producer. It will not mold, sour or rot, and will retain its acidity and other properties indefinitely and under any climatic conditions. Nothing, however, will convince you of the worth of LACTEIN like feeding it to your own chickens or hogs. "The proof of the pudding is in the eating thereof." Any chicken or hog raiser who will feed LACTEIN as directed for 30 days will thereafter never be without it, for it means more healthy chickens and hogs, more rapid growth, more eggs, more pork, and more money.

## LACTEIN

LACTEIN is put up in wood barrels holding five, twenty-five or fifty-two gallons. Should your local feed dealer not have LACTEIN, write us direct and we will see that you are supplied without delay, or better yet, fill out and mail the coupon below or a copy of it, and we will send you a five-gallon keg by express, prepaid. This when diluted with water as per instructions is equal to 250 gallons of the best fresh buttermilk for chickens or hogs, and is sufficient to acquaint you with the wonderful merit of LACTEIN. The price in fifty-two-gallon barrels is \$26.00 per barrel, twenty-five-gallon barrels, \$15.00, and five-gallons \$3.50.

The largest and most successful chicken and hog raisers all over California feed and recommend LACTEIN, and the results they obtain are really remarkable.

Address all inquiries regarding LACTEIN to

## *It Must Be Kept Alight!*

UPON America devolves the sacred duty of keeping alight the torch of Liberty and upholding justice and democracy throughout the world.

Let us not falter or count the cost, for in the freedom of the world lies our only safety and the preservation of our American liberties and institutions.

It isn't a matter of choice that America is in the war. We chose to be an observer only for nearly three years, or until human liberty was nearly crushed from the earth. When duty drove us to take part in the world war we entered with all our mind, might, strength and soul.

Keep Liberty's Torch Burning.  
Buy Liberty Bonds. Buy W.S.S.  
Conserve Food. Produce Food.

# WHICH?

**Loan Your Money  
to Uncle Sam**

OR

**Let the Kaiser  
Take it From You**

**M**ONEY earned through your liberty will do no good if the Kaiser wins.

Money loaned to Uncle Sam pays you interest and is safe. If the Kaiser wins, what you have will be taken and you clubbed for not having more.

You may have bought a First Liberty Loan Bond. And you may have bought a Second Liberty Loan Bond. And you may have foregone some pleasures or comforts in buying either or both.

But you **must** buy a Third Liberty Loan Bond.

This is more than a duty. It is your country's call at a time when *more money* is needed to win the war.

The vast sums already raised and expended were but stepping stones. Now comes the Third call and you must respond generously—with sacrifice, if necessary.

Let us finish it now—as a whole nation unified in lending. It is the only way to win, and win we must. Buy that Liberty Bond *today!*

The Pacific Slope Branch of the American Association of Economic Entomologists Discusses Problems Affecting California Horticulture

FOR the first time the Pacific Slope Branch of the American Association of Economic Entomologists met recently at Riverside and later at Alhambra with the officers of the state insectary and members of the department

of agricultural force which are permanently located in Southern California at Alhambra. Besides the usual attendance — even a greater than usual attendance on the part of Coast members — the meeting was honored by the presence of Prof. Fernald, entomologist of the University of Massachusetts.

The first day's sessions were held at the experiment station at Riverside, following the dedicatory services. At both that and the Alhambra meeting there were scientific papers but more largely the discussion followed the lines of practical insect control.

The election of officers resulted in Prof. H. J. Quayle of the University of California being named president and E. O. Essig, farm adviser of Ventura County, secretary.

On the second day of the meeting a luncheon was served the members at Pasadena, after which a pleasure trip was taken through the Huntington Estate and the Busch Gardens. The Huntington Estate makes a showing of one of the finest collections of native and exotic plants in existence.

Regarding the work and history of the association President Quayle says:

The American Association of Economic Entomologists was organized in 1889 and now includes a membership of more than 500, practically all of the entomologists of the United States and Canada, as well as the

leading entomologists of foreign countries.

This association meets each year during the holidays in connection with the meeting of the American Association for the Advancement of Science. Its last meeting was held in Pittsburg. The officers of the association for the present year are: Dr. E. D. Ball, president, Madison, Wisconsin; Professor W. C. O'Kane, vice president, Durham, New Hampshire; A. F. Burgess, secretary, Melrose Highlands, Massa-

chusetts. This association publishes the "Journal of Economic Entomology" the leading publication of its kind in this country.

On account of the distance to most of the meetings of the parent association, which are usually held east of the Mississippi, the members in the Western states organized a branch association three years ago. This is called the Pacific Slope branch of the parent association, which includes entomologists west of the Rocky Mountains.

## War-Time Rations for Dairy Cows

Address by Prof. F. W. Woll at Dairy Conference at Davis

THE war has affected the business of dairy farming as it has other industries: it has greatly increased operating expenses through the higher cost of supplies and the higher wages that milkers and ranch hands can command, as compared with pre-war times, and to offset the increased cost of production, at least in part, the price received for the milk or butter fat is considerably higher than before the war—in spite of which milk is still the cheapest animal food that enters into our dietary. It is practically indispensable to the human race, furnishing easily digestible food components at a relatively low cost. It supplies the sole source of the so-called vitamins, food accessories of prime importance in the nutrition of the young, and at least so far as dairy stock is concerned, the by-products of the dairy form a most important factor in the development of a strong body frame and a vigorous constitution which are essentials in successful dairy husbandry.

The changed conditions during the past year have worked to the disadvantage of the dairy farmer, and he finds himself more than ever before under the necessity of lowering the cost of production of the milk in

order that the accounts may balance or show a profit at the end of the year. There are at least four factors that enter into the case and determine the production cost of his product. The first and most important is the amount of milk produced by the cows. The other three are, the cost of equipment, of labor, and of feed. The average dairy cow of the state produces hardly more than 500 gallons of milk a year. Against this we have no doubt thousands of cows that produce over 8000 pounds a year, hundreds that produce over 12,000 pounds, dozens that produce over 24,000 pounds, and a very few that have even exceeded 30,000 pounds of milk a year, which is nearly eight times the average production of a dairy cow of this and many other states. Now, how does this affect the production cost of the milk? An inquiry conducted a few years ago at the Ohio station suggests the answer. It was found that under the conditions prevailing at that time, it cost on the average 6.2 cents to produce a quart of milk from cows yielding 3000 pounds a year; 4.7 cents for 4000 pound cows; 3.8 cents for 5000 pound cows, and 3.2 cents for 6000 pound cows—a reduction of 3.0 cents, or about 48 per cent, in the cost of production for the best cows

over that for the lowest producing cows.

To reduce the cost of producing milk, therefore, produce more milk per cow. That offers the greatest opportunity for lowering the cost. The dairyman whose cows average 8000 pounds of milk or better a year does not have to worry much about the increased cost of supplies or labor. He is receiving more for his milk or butter fat than he did previously and is, as a general rule, perhaps even somewhat better off under war-time conditions than before. But this is doubtless not the case with the large majority of dairy farmers whether they furnish the milk for direct consumption, or for the manufacture of butter, cheese, or condensed milk. The road to improvement is open to these, however, and in view of the low production of most of their cows, the results of measures taken with a view to increasing the milk yield will be likely to be more readily obtained and more decisive than in the case of herds that already have a high average production. It is only necessary to suggest the two main measures that may be taken: Selection of the best dairy-bred bull of the breed decided upon that one can afford, to be placed at the head of the herd, and

persistent culling out of low and unprofitable producers in the herd until this shall contain only cows of good dairy type and known dairy capacity. The third measure that must accompany these two is feeding and handling of the herd in such a manner as to secure a maximum production from them at as low a cost as possible.

Of the other factors influencing the production cost of milk, than that of the amount of the milk yielded, the item of cost of equipment is largely beyond the control of the dairyman. Under the state dairy law, he must provide appliances which will insure the production of an article that is up to a certain sanitary standard. The labor cost is also determined by conditions that he can control only to a limited extent. He cannot, as a general rule, work harder or during longer hours than he has in the past, and he cannot get any more work out of the help than before, if as much. He can cheapen the work of milking to some extent by the adoption of machine milking, but unless he has a large herd, the saving will come more in making the work easier than in reducing materially the time it takes to milk the cows. This leaves, therefore, the feed as the main reliance on

## MICA AXLE GREASE

## More About June Drop

Written for California Cultivator By Robert W. Hodgson

SOME weeks ago in these columns the writer discussed two specific cases of orange groves which did not suffer the drop occasioned by the hot spell of last season to anything like the same extent as other groves in the same vicinity. On analysis, these instances were found to be in direct accord with the findings of the agricultural experiment station, reported in Bulletin 290, and indicated rather conclusively that one of the most important causal factors of the drop lies in abnormally high soil temperature during the critical period.

In the bulletin referred to the recommendation is made that the growing of alfalfa, or summer cover crops such as cow peas, may be expected to result in heavier crops. A number of citrus growers have expressed some surprise at this recommendation and are inclined to look askance at such a procedure on the grounds that under normal conditions it is impossible to get a summer cover crop in and up before the trees come into bloom. This is quite correct. The question has, however, to do not only with the time of bloom, but also with what is known as the "critical period."

There is a period beginning at the time of bloom and lasting until the development of strengthening tissue occurs in the pedicel, when the young fruit is very loosely attached to the tree. At this time the only tissue holding the fruit to the tree in any secure fashion is the central vascular system consisting of a few wood vessels. This critical period lasts from the time of bloom for six weeks to two months. During that time the pedicel enlarges but little, but with the end of the period it commences to grow rapidly and in a short time reaches its limit of growth, being as large as it ever gets. During this growth period a large amount of fibrous strengthening tissue is laid down through the joint in the pedicel, making it quite difficult to sever the fruit from the tree at that point.

During the "critical period" disturbances in the water relations of the tree, if marked enough, initiate what is known as an abscission process which results in the separation of the plant cells in the region of the joint in the pedicel. This leaves the fruit attached only by the weak vascular system, and a slight jar is usually sufficient to cause the fruit to drop. In some cases where the atmospheric humidity is extremely low this central vascular system dries so rapidly that it becomes tough and the young fruits shrivel up and hang on the tree the rest of the season, supported by this dry central core.

As a general rule climatic conditions during the blooming period are not unduly severe and the danger from excessive drop not great. It is toward the latter part of the critical period that we may expect hot dry weather. If the summer cover crop is in and up by the latter part of April under ordinary weather conditions it may be expected to materially cut down abnormally high soil temperatures which may occur toward the end of the critical period. Last season the bloom was so late that summer cover crops were planted in some cases in time to function during the greater part of the critical period which was approximately from May to July.

The writer recently had the pleas-

ure of going over the Arlington Heights fertilizer plots, conducted by the citrus experiment station, with Mr. Gordon Surr. Some most interesting results have been obtained there this last season, particularly as to the size of the crop borne on the plots receiving different treatments. Some of the plots have been mulched with alfalfa hay and some with barley straw; several had summer cover crops of buckwheat and several, cow peas, both of which were let go to weeds, while one plot is in permanent alfalfa. In every case where the ground was shaded, either by a mulch or by a summer cover crop, during the heat wave of June, 1917, the crop borne by the trees is noticeably larger than on the plots not so treated. The writer is informed by W. M. Mertz, formerly of the citrus experiment station, that the same condition holds true with reference to the mulched plots at the experimental plot at the Chaffee Union High School at Ontario. The heaviest yields were obtained on the mulched plots.

The Arlington Heights plots, however, exhibit another very marked influence on the amount of crop borne to maturity. Apparently where there was an abundance of nitrates readily available to the trees during the hot spell the crop set was much larger than where the nitrates were not so readily available or the amounts not so large. Indeed in one case an almost quantitative relation between the amount of available nitrates and amount of fruit borne can be established. One plot received a certain amount of dried blood in addition to some other fertilizers. Another receiving exactly the same treatment, with the exception that the amount of blood was just twice as much, has apparently almost twice as much fruit. In the opinion of those most familiar with the experiment there can be no other explanation than that this is the most direct effect of the presence of available nitrates. This at once raises the old question as to whether it is not possible to increase the amount of fruit by the application of a fertilizer high in available nitrogen prior to the setting period. It also raises the possibility that many of our citrus trees are greatly underfed with regard to nitrogen and that the stimulus to abscission is brought into play more easily under these conditions. If this be the case, the amount of available nitrates must serve as a limiting factor to heavy crops. At any rate, these results indicate very strongly that during the critical period every effort should be made to keep the trees well supplied with available nitrates and to prevent soil temperatures from becoming abnormally high by the use of summer cover crops.

—LIBERTY BOND—  
CAROB

We are informed that Peter Bisset of the bureau of plant industry, United States department of agriculture, is making an effort to secure from Spain and Algeria some budding wood from the most desirable varieties of St. John's Bread tree (algaroba or carob). Like nearly all other trees the carob refuses to breed true to its parents, at least to do so is the exception, though from some of the earlier planted seedlings in the state there have been produced occasional trees which are large producers and producers of exceptionally rich "fruit." One tree at Rialto is said to produce pods which show more than 50 per cent sugar. This tree will doubtless be used to supply budding wood to some of the seedlings now grown in the state. There are other trees also of value, but none showing quite the sugar content of this one.

## Value of Green Manure Crops in Southern California

A bulletin which should prove of great value to the agriculturists of Southern California has just been issued by the University of California College of Agriculture. It is entitled "Green Manure Crops in Southern California," and was compiled by W. M. Ortiz, who until January 31, 1910 was superintendent of cultivations at the Riverside experiment station. For the past ten years experiments have been in progress in the citrus experiment station to determine the value of green manures in citrus orchards, and for the past six years there have been conducted experiments to determine the relative effects of the different green manure crops, including legumes and non-legumes. In this bulletin are given the results of these experiments and the deductions made therefrom.

A number of legumes gave satisfactory results when grown as green manure crops, of which Melilotus Indica (bitter clover) is the most promising, both from the standpoint of vigor and availability of seed. It has also been proved to be well adapted to a great variety of conditions. Purple vetch gave heavy yields and is more rapid in its early development than the Melilotus Indica. When seed becomes available in sufficient quantities it should be largely planted. Burr clover did not give as good results as Melilotus and is of value mainly in sections and under conditions where its early seeding habit will permit of its re-seeding itself. Fenugreek was not found satisfactory, and spring vetch and Canada peas

were found of value only in sections where the green pea aphid is not yet a factor.

Legumes were shown to be far superior to non-legumes in their effect on the field crops following.

It has been conclusively shown that green manure crops produce a marked effect on citrus crops, the trees so fertilized being in every way superior to those not so fertilized. Not only was more fruit produced, but much larger and finer fruit, and mottle-leaf was noticeably less. These cover crops not only add to the fertility of the soil, but conserve the fertility also as they prevent washing of the top soil during heavy rains. By absorbing the excess nitrogen of the soil and holding it until they are plowed under, they keep this nitrogen from leaching below the reach of the tree roots, and the decay of the roots of the cover crop, which have been found at a depth of eight feet, tends to make the soil more open to the air and water.

Green manure crops should be sown during September or October, and irrigation is usually required to start the growth and carry the crop until the rains begin. Artificial inoculation is seldom necessary in Southern California. To get the best results the green manure crop should be plowed under seven to ten inches and the soil should be moist at the plowing, even if necessary to irrigate beforehand.

The bulletin may be obtained free of cost by writing to the College of Agriculture, University of California, Berkeley.

## Subsoil

The local center of the Los Angeles County bureau at La Habra is one of the live institutions of the most noted of the state. At the regular meetings an effort is made to have "outside talent" occasionally but more often members of the center deliver practical talks on their own home-made products. Some time ago—before the recent rains—M. J. Pickering delivered a talk on subsoiling, discussing it especially from the standpoint of conserving as much of the soil's scant moisture as possible. The rains have come in such abundance since that for this season this talk ceases to have some of its former value but there are some points in it which we have been given the liberty to quote.

"In a general way subsoiling means breaking up the ground just beneath the soil or top layer. No attempt can be made now to discuss the various types of soil and subsoil in which subsoiling may or may not be needed. There are special conditions which make it not only desirable but helpful and necessary. It is helpful at all times, everywhere, excepting in deep sandy soils, especially so in parts of the orchard where the top soil has been removed in whole or part, leaving the poorer subsoil to support the trees. The part of the orchard to which the dirt has been taken does not need to be broken up till at least a few years later. Subsoiling is also quite helpful where there is a decided change in the slope, as on the steeper part of a hill. If the water runs down the steep part slowly enough to wet it properly the level part near the pipeline will get too much water while the lower part beyond will not get enough water.

"Also any unusually hard portion or spot that does not take water readily should receive extra attention by the subsoiler.

Mr. Pickering summarizes as follows:

1. Not extreme depth occasionally, but frequently at the proper depth, is the better plan in subsoiling.
2. Break up the ground so moisture and plant food can go down and the roots will go after them.
3. The subsoiler is one of the cheapest of tools, in both first cost and upkeep.
4. The subsoiler is the most efficient tool for deepening the soil and destroying plow sole.
5. The subsoiler conserves both water and plant food.
6. Use the subsoiler now to save moisture, and also cover crop. Breaking ground open now would prevent any loss of either irrigating or rain water, and permit cover crop to grow a few weeks longer.
7. The subsoiler increases the financial returns to the grower by increasing quantity and bettering quality of fruit.

### —LIBERTY BOND— YEAR BOOK OF INTERNATIONAL AGRICULTURAL STATISTICS

The International Institute of Agriculture at Rome, Italy, announces issuance of the International Year Book of Agricultural Statistics, containing data relating to yield, trade, consumption, prices and rates of freight for the chief products of the world's agriculture during the decennial period from 1907 to 1916.

This is a volume of 1000 pages and is sold for the low figure of eight shillings (\$1.95) post free.

## Farm for Profit

### and Help U. S. Win the War

Authoritative tests have proved that as high as 50 per cent increase in crop production may be expected from proper use of fertilizer. Do you realize what that increase means? Fertilizer is the basis of crop production, and compared to the prices of the crops they help to produce, fertilizers were never so cheap as they are today.

## MORE CROPS

will be raised in America this year than ever before. Make every acre you own or rent, produce to the limit. Fertilize your land—the increase in yield and price of crops will more than pay all the fertilizer expense—it will enable you to farm with profit. Don't spend your time working worn out land. Make it pay—Fertilize with Hauser's Organic Fertilizer.

## Valley Fruit Growers Association

Membership Campaign Under Way—Effort to Secure Sufficient Labor Supply for This Producing Season and the Harvest.

THE management of the Valley Fruit Growers' Association delayed its spring drive for membership until the Associated Raisin Company finished its campaign for five year contracts, but about the middle of March it sent out its 10,000 harvest labor questionnaires and is now canvassing nearly all of the Central California counties for new members. Regarding the need and the labor problem W. Flanders Setchel, president of the association, writes:

The harvest labor problem has been recognized as under present conditions the supreme task of the association. This problem, is, however, closely identified with the membership campaign, for in finding a solution of the harvest labor problem the association must be in possession of concrete evidence of the actual labor requirements of the district.

To make this possible the growers must join together in a cooperative effort in order that federal, state and other bodies will accept as authoritative the representations made by the association in the behalf of the growers.

During the summer months preceding the 1917 harvest season farmers' meetings were held throughout the state, whereat there were presented estimates of harvest labor requirements by different organizations for their respective districts. At these meetings the representatives of the Valley Fruit Growers' Association alone were able to demonstrate the needs of the district they represented, by a clear convincing tabulation rigidly confined to ascertained facts and capable of withstanding every investigation.

This one fact did more, probably, to establish the prestige of this association throughout the state than any other circumstance arising from the general efforts then being made to care for the harvest needs of California's farmers, and in no small measure was this prestige, so gained, the means whereby this association was enabled to present and to press its requests and representations for official assistance and cooperation.

Problem More Serious Than Ever

For the ensuing season the harvest labor problem will from the standpoint of available supply be more serious than ever before.

The draft, together with general industrial and agricultural developments, has further depleted the available harvest labor. It will be essential that the harvest labor requirements for 1918 be determined upon what practically amounts to a census basis, and to this end the association has issued the questionnaires. It is now squarely up to the growers to put in the foundation upon which the association can build the machinery for caring for the harvest labor requirements. The effectiveness of the association's work in obtaining labor will be in exactly the same proportions as the growers' response to the questionnaires now placed in their hands.

Depends Upon the Farmers

Built upon the solid foundation of an impressively large membership, fortified with accurate and authoritative knowledge of this district's harvest labor requirements, this association will be enabled to make its needs heard wherever it may seek assistance and cooperation. Official bodies to whom the association must make representations in the behalf of the growers will compute its weight and authority by the number of its members.

## Lime---Gypsum

The question often comes as to whether gypsum will correct soil acidity, also other points as to application of lime or gypsum, so we submitted the question to Dr. R. R. Snowden, and he writes:

For correcting acidity of the soil the carbonate of lime is the best form, since it is equally efficient with the hydrate or slacked lime and is not destructive to the humus.

The lump burned lime should never be used because of its strong caustic action and its certainty to liberate and cause loss of ammonia. Slacked lime, unless air slacked, is also too caustic, though when acidity is strong it maybe used to advantage.

Beet sugar lime, on account of its fineness is, unit for unit, the best carbonate of lime, but is liable to carry much water, which the buyer must pay freight and handling ex-

bers. It lies, therefore, with the farmers to give to this association power and influence.

Sections Organizing

The fruit growers of Northern and Southern California, impressed by the success of this association, are now organizing themselves along similar lines, so that while last year this association had the advantage of other districts in being organized, this year it will have active competitors for the available harvest labor supply of the state. With the support of the growers for this association, however, the advantage will still lie with this district, for here alone is the experience in the handling of such a problem available, gained and tested in successful practical accomplishment.

Again, it is up to the growers.

As nearly as possible, every raisin grower and every fruit grower of Fresno, Tulare, Madera and Kings Counties has been mailed a copy of the association's questionnaire. Any grower who has not received one should without delay get in touch with the association by letter or telephone and ask for a copy. The state farm labor agent representing the United States department of agriculture, the state council of defense and University of California have suggested that the plan adopted by this association in sending out its harvest labor questionnaire should be adopted all over the state during the coming season.

pense on without compensating return.

Conditions indicating the need of lime are (a) acidity; (b) deficiency of lime as found by analysis. The official method of analysis may show a great deal of lime when the crops on the same soil are suffering for lime. It will take account of the lime in certain combinations that the plants cannot use; (c) where the soil is a tough adobe. In Imperial and Coachella Valleys and some of the higher valleys of this state there is sufficient lime carbonate, but the soils of this southern valley are generally deficient in it. Stable manure is incompatible with either hydrated or carbonate of lime, so when it is to be applied where lime is also needed the form of the latter must be gypsum.

Lime, especially the carbonate, has the property of cementing the grains of a sandy soil, — and is said to increase its moisture holding capacity.

## Cooperative Credit Association

In answer to many requests from individuals and officials asking for assistance in the preparation of a suitable state law for cooperative credit associations, or credit unions, the bureau of markets of the United States department of agriculture has prepared a publication (Service and Regulatory Announcement No. 30) which gives suggestions for such an act, and contains a bill embodying the best views on the subject. The bill, which is submitted only as a tentative model, provides for the organization of associations without capital, as well as for the more familiar form with capital stock. In the form without capital stock it is intended to exemplify to the fullest extent the cooperative idea, and to avoid even the appearance or the possibility of profit-making. It is believed, say specialists of the department, that the practical effect of the work of a cooperative credit association will be to accustom men who are not now mak-

ing use of any banking facilities to take advantage of banking, rather than to withdraw business from existing commercial banks.

Some of the states (Massachusetts, New York, North Carolina, South Carolina, Oregon, Texas, Utah and Wisconsin) already have enacted special laws providing for the formation of cooperative credit associations. In some of these states, especially in Massachusetts, New York and New Jersey, organizations have been formed and are working successfully among factory and other workers in cities. The development of cooperative credit associations in rural districts is especially noted in North Carolina.

until you write us.

**C. J. GARDNER CO.**

Box 16

Santa Ana, Cal.

just issued for free distribution by the United States department of agriculture.

Practically the same plan as is described in the bulletin was followed in 11 other communities during the summer and fall of 1917, and the information is given at this time because of a demand for it for consideration at farmers' meetings. The plan proved successful under conditions found in the locality of Lincoln; in more humid or dryer sections of the country, the bulletin says, the methods employed might not prove satisfactory.

All will find valuable suggestions in Farmers' Bulletins 841 and 903, as well as the new publication. They may be obtained free upon application to the Division of Publications, United States Department of Agriculture, Washington, D. C.

—LIBERTY BOND—

SINKING OF FERTILIZER IN SOIL

Written for California Cultivator  
By J. R. Mattern

**T**HROUGHOUT all irrigated sections, and even in those places where water is not applied, entirely too little attention is paid to getting the fertilizer that is applied into the lower soil evenly and deeply. It is placed on the surface, and few indeed are the farmers or fruit growers who ever investigate whether it stays there, leaches away in the drainage water, or sinks below root depth.

Investigations by several competent people during the past few months have shown that wherever water is used the nitrates especially tend to gather or accumulate immediately under the furrow depth. A test hole dug down alongside an irrigation furrow or basin usually shows little of such available plant food in the upper few inches, a rather heavy accumulation in the few inches right at the bottom of the furrow, and practically none below that level.

The reason for this is that the soil, unless of a decidedly sandy nature, acts as a filter and takes from the water that is sinking and seeping downward any fertilizer or plant food it carries. Coupled with the poor distribution of fertilizer is a poor water penetration. The soil takes water slowly, holds little in capillary form, and dries out quickly between watering periods.

Whenever the plant food in a soil is confined to certain spots only, trees or crops of any kind cannot thrive. A few plants or a few roots of a tree here and there may get all they require, but the tree as a whole and the crop as a whole may starve right beside abundance of food.

The uneven distribution is indicated by uneven growth and health of trees or crops, but can be detected before such signs show plainly by noting that water fails to sink into the ground as freely and quickly as it might. Another sign is the drying out of areas. When the soil is clogged, or compacted, the movement of moisture in all directions, but particularly in the vital upward direction, is hindered or prevented entirely. Nor will such soil hold nearly so much moisture in capillary form as if it were properly mellow and loose.

The remedy is obvious and to a certain small degree already has been applied in many orchards and groves. The blasting of soil just where trees stand, however, is not enough. It should be broken along the lines of the rows at least one way, so that moisture in one part of the under soil may move more or less freely to another in case of a surplusage one place and shortage another.

other in case of a surplusage one place and shortage another.

The blasting must be done only when the ground is dry. If done in wet ground, pot holes and compacting are likely to result, though in non-plastic ground the crumbling and splitting is general over an area many feet in diameter. The sample for testing should be taken from a couple of feet under the surface and should be dry enough so that under pressure it fines and runs between the fingers.

In open ground the moisture that moves downward and in other directions carries with it all the fertilizers that are applied. In a short time the lower soil, where most of the feeding roots of trees naturally are located, become enriched. If cover crops are sown immediately after the breaking, their roots penetrate deeply, and later, dying furnish much organic matter which assists in maintaining the mellow condition.

—LIBERTY BOND—

A writer in the Popular Mechanics Magazine thinks that the tanks now used in warfare can be employed in reclaiming the farms of France when peace comes. The tanks can be used to draw specially devised plows in the first rough cultivation of the crater areas.

VALUABLE TO FRUIT GROWERS

Every fruit grower will be interested in Farmers' Bulletin 908, "Information for Fruit Growers About Insecticides, Spraying Apparatus, and Important Insect Pests," by A. L. Quaintance and E. H. Siegler. It may be had by writing Department of Publications, U. S. D. A., Washington, D. C. There are 100 pages, many illustrations, and a valuable fund of information on spraying methods, how to prepare insecticides, and how to use the spray pump.

—LIBERTY BOND—

COMPENSATION FOR BAGS

The ruling has been made that while no definite allowance is set for barley, it is a fact that the value of the second-hand bags is added to the bulk value of the barley, and indirectly the farmer will get back just about the same proportion of the cost of his bags when he sells his barley. Many farmers, it was said, do not realize this, but feel that they have to stand the entire expense of sacking grain.

On bags containing wheat a definite price has been set at nine cents per bushel allowance on bag value.

Twenty-four experiments are being carried on by the division of pomology at the University Farm to furnish the material for the demonstration and exhibits which it has planned for the benefit of fruit growers who visit the farm on Picnic Day (today), April 20. Valuable data has been gathered from investigations into methods of pruning, pollination, irrigation, mulching, drying and curing of fruits, control of diseases, and variety tests. The proper arrangement of varieties of fruits and nuts, especially plums, prunes, pears, and almonds—in order to secure perfect pollination, has been determined.—W. D. J.

—LIBERTY BOND—

W. C. Jacobsen, superintendent of rodent control of the state commission of horticulture, reports good progress made in the educational campaigns being conducted in various localities. Valuable help has been given by the county horticultural commissioners and the farm advisers, and all organizations possible have been asked to cooperate to make the squirrel control campaign a success.

—LIBERTY BOND—

Not "Bit" but "Best"—the end is worth our "All."

# How long will it run?

and what kind of service does it give you while it is running?

Those are the questions:  
You are not so much interested  
in how fast it will run  
—but how long it will run  
—how long it will last  
on your work?

## —Test Special Belts

—last and run and do their work well for years—it depends on the kind of work. Some belt users buy cheap belts made of short fibre cotton and shoddy rubber — consequence : they last a few months—maybe not a whole season.

You can't throw money away faster than to buy that kind of a belt—besides, when it fails to do your work the need may be greatest. Buy a Test Special belt in the first place—it lasts for years. Write us.

**BELT TROUBLES:** Do you have any troubles with belts? We are belt engineers. Send us a rough drawing to indicate how your belt is operated, and tell us your troubles. We'll cheerfully help you solve them—FREE.

# No Tax For These "Improvements"

**M**ORE rubber between layers separates the plies of fabric, an elastic wall allowing free play without friction. More cushion stock, pure rubber between fabric and tread as a protection against shock and injury.

Reinforcement in bead and side wall greatly increases strength at junction point.

The tough, thick tread gives many more miles of wear with a safe hold.

These values to such a high degree are new to fabric tires. Firestone engineers arrived at these unequalled results by applying some of the principles established in developing Firestone Cord Tires. Ask your dealer to show you a cross section sample. Meantime write for our book No. 36 on "How to Increase Tire Mileage." It's free and will show you how to save some money no matter what tires you use.

See your dealer. If he is not ready, he can promptly be supplied from the nearest Firestone Branch.

Extra parts are always available without delay for standard advertised machinery. This class always found in the California Cultivator.

## Facts for Farmers

**P**RESIDENT WILSON, in his address at Baltimore, opening the campaign for the third liberty loan of \$3,000,000,000, answered the challenge of the German military offensive on the western front in the following words:

"Germany has once more said that force and force alone shall decide whether justice and peace shall reign in the affairs of men; whether right as America conceives it or dominion as she conceives it shall determine the destinies of mankind.

"There is, therefore, but one response possible from us: force, force to the utmost, force without stint or limit, the righteous force which shall make right the law of the world, and cast every selfish dominion in the dust."

That is straight from the shoulder American talk. It must be backed by straight from the shoulder Americans. We farmers and live stock men of the Pacific slope are that kind of Americans and we've got to square our jaws, hump our backs and put that talk over in the only language Germany understands—guns and bayonets.

There is just one way to exert "force, force to the utmost, force without stint or limit." That is by skimping and scrimping and buying liberty bonds. In uttering that eloquent phrase our commander-in-chief of the American army meant bonds, bonds to the utmost, bonds without stint or limit.

Yes, there are lots of things wrong, probably—lots of "ifs" and "buts" in this war. Maybe we aren't getting what we ought to for our wheat, our sheep, our cattle, our fruit and our everything else. Suppose we are up against it for labor; supposing we are paying double for nearly everything. That doesn't alter the fact that we've got to win this war. There will be a lot more things wrong if we don't win.

And don't get the idea that it's going to be a short war. It isn't. Use your head on this war just as you use it every day running your ranch or

range. Figure on facts. When you figure on facts you can't get away from the big facts that right now Germany is traveling faster with her armies in France than she ever did since she first started for Paris. And she has more men and bigger guns than she ever had. Look at the facts in her last drive. Never mind the newspaper headlines. You don't want hope; you want facts.

Read your newspaper like newspapermen read it in these times of military censorship. When you read that the British are going to conscript in Ireland; when you read that our draft has been speeded up; that men are flowing to France faster than they ever were, use your head and draw your own conclusion that events are crucial, that more men are needed. If they weren't needed they wouldn't be sent. Let the dreamer flirt with hope. As for yourself look facts in the face.

A lot of perfectly good paper and good ink has been wasted in a misguided effort to single the farmer out as a separate class in this war. We aren't a separate class. We are just plain Americans making our living by farming. We have no more or no less responsibility in this war than any other A-1 American citizen.

"I appeal to every man and woman who resides upon the soil of free America and enjoys the blessings of her priceless institutions to join the League of Patriots by purchasing a liberty bond," says W. G. McAdoo, plain American and secretary of the treasury. That means us.

Of course this idea of bond buying is a new one. The only newness in it is the word "bond." Buying bonds is simply putting a little money in the bank every time you get hold of it.

Face facts again. The only reason that the government is floating liberty bonds is that it needs money. It needs money because we are in a war that eats up money and men like idle mules get away with the alfalfa. You can make a bet the government wouldn't offer 4½ per cent if it didn't need the money. Buy Liberty Bonds.

## The First Year of the Federal Farm Loan System

The federal farm loan system has completed its first year of actual operation. The first charter issued to a federal land bank is dated March 1, 1917, and the charters for the other 11 were issued during that month. Borrowing under the federal farm loan system is done through national farm loan associations, and the first charter granted to one of these associations is dated March 27, 1917; so that while most of the work of organizing the banks, systematizing their business, appointing and training appraisers and the like had to be done after the end of March, 1917, it may be said that the banks have just about concluded their first year of operation. A statement of the business done during this first year is therefore of interest.

Before the system was put in operation it was argued that our American farmers would not organize for co-operative borrowing. The answer to this seems to be found in the fact that up to March 31, 1918, 2808 national farm loan associations were incorporated, representing about four associations to each five counties in

the United States. These associations average about 20 members, representing a total membership of about 56,000 farmers.

The 12 federal land banks have received applications for over 120,000 loans, amounting to about \$300,000,000. Many of these applications have been rejected, reduced or withdrawn. About 80,000 loans have been approved, amounting to over \$160,000,000, and on over 30,000 of these loans money has been paid to the farmers to the amount of about \$80,000,000. Many of the loans approved were for reduced amounts which the borrowers declined to accept.

Notwithstanding the unusual expenses incident to the operation of new machinery and to the appraisal and determination of title on many loans that have not yet been closed, the expense of the banks in doing business has been within such limits as to justify the expectation of the farm loan board that these banks will easily be able to operate on a difference of one-half of one per cent between the loaning rate and the rate which they pay on their bonds. None of the banks, of course, received any appreciable income from their business during the first half of

the year, but during the last half the business of the Spokane federal land bank, for example, was sufficiently profitable to come within about \$10,000 of wiping out the excess of expenses incurred in the first half, and the volume of business on its books assures it a handsome surplus for the second year. Every borrower, when he takes out his loan, makes a sub-

scription which increases the stock of the federal land bank to the extent of five per cent of the amount borrowed. These stock subscriptions of borrowers, in the case of several of the banks, are now so large that, in accordance with the provisions of the act, the retirement of the original stock of the banks, which was principally subscribed by the government, will begin within a few months.

## Don't Be a Welcher

Do you realize that he who lends to Uncle Sam gives manyfold to himself, and that his interest is paid in dollars, in safety, in honor, in victory, in life itself?

Do you want, in the ultimate hour of America's monumental triumph, when she has restored peace to the universe and freedom to all peoples, to say to yourself, "I did nothing to help all this"?

Do you hope for the achievement of your country's aims and promises, ideals and pledges, yet hoard a few beggarly dollars at the same time?

Do you value a cold dollar more than the hot thrill of having done a citizen's full duty; struck a blow against abysmal tyranny; backed the

lads who are fighting for you; saluted Old Glory and kicked the kaiser?

Do you still look a fat bank balance in the countenance when every true American is ready to strip himself for the world's salvation on earth?

Do you experience any emotion when the "Star Spangled Banner" is played and can possession of a few hidden currency notes give you the same grand sizzle of pride, love, courage, hope, and exaltation?

Buy another Liberty Bond and swell your American chest—you have helped make world history; you have helped make world humanity; you have helped make world glory for a glorious world saved from butchery and kultur.

## The Working Farm Manager

Written for California Cultivator By D. J. Whitney

**Y**OU can talk about the farmer, the tenant, the hired man, the hobo, and the back to the lander, but one of the most important personages in the farming business in this section of country at least, is the working farm manager, which is probably as good a name for him as can be given.

By this term is meant the man on a salary who operates a ranch in the absence of the owner, who is usually a city man who some time or other got the idea he wanted to get back to the land or to show farmers how to make money in farming, or something of the sort; and so bought some orange or olive land, had it planted, and proceeded to pay the bills while another man ran the place.

### A Neighboring Example

Not far from here is a fine young orange grove just coming into good bearing. The working manager has a farm of his own, but the owner of the orange grove will not let him leave, simply because it is too difficult to get some one else in his place. He keeps a cow and chickens, supplied by the owner; all grocery bills are paid, and the monthly salary is a good deal nearer \$100 than \$75.

This working manager states that he would pretty near die if he had to be locked up in an office, that outdoor work suits him perfectly, but you will go far and search long before you will find an office man who will have the opportunity of putting away anything like half of what this man can save.

### Requirements

A man for this kind of a job must know how to care for orange trees. Any man with a good head and a taste for farming can learn this with a moderate amount of experience. Next, he has to be conscientious and work as well when the owner is away as when he is near.

This is where scores fall by the wayside. Sure, they are honest, in their own minds, but it is very easy to let things slide along and a good deal easier to do so when another man bears the costs. So first, with lots of fellows, some things are slipped over; then they are slipped over still more, and then more yet, until the place is in such a condition that a whole lot of work and expense has to be put on it to get it back into anything like real shape.

There is a neighboring orange grove where the owner has not been so fortunate and has changed managers about a dozen times. With few exceptions the men have started in with a hurrah. They meant well, all right, and worked fine for about two weeks; then did not work quite so hard, and soon things were gliding along as if it were half vacation. So, the most important thing of all is the inner worth of a man that keeps him

up to the mark all the way along. Most men cannot make a success when they are working for themselves, and they will make far less of a success when they are working for some one else.

On a place like the one referred to, there is about \$75 a month salary with cow, chickens and garden, yet most men will not make good on it.

### Woman's Work

What is a farm without a wife? There are more than a few persons within a few miles who are trying to back and farm at the same time, but it is a poor sort of a proposition. Neither living nor farming seems to be much of a success in most cases. So, also, in working a place on a salary, a wife is as much of a necessity as when working a place for one's self.

In the first ranch noted, it takes two men to keep things going. The second man has to eat, and no man wants to work on wages and board himself, so the manager's wife has to cook for, in this case, one extra at all times. Furthermore, at certain times, such as harvest, there is work for a crew of men, and they have to be fed. The standard method on most such ranches is to allow extra when men are fed, so when extra work comes for the farm woman extra pay comes also. The responsibility of seeing that things go right rests thus on the manager's wife as well as on the manager. Conditions on most such ranches, however, are exactly what a woman would face if her husband owned the place. In one respect they are a little more troublesome, for the owner of a ranch expects to show up once in a while and he has to be fed and sometimes put up.

An important feature about the working manager proposition on a small ranch is, therefore, that the unmarried man is nearly ruled out of it. Otherwise the qualifications are: knowledge of how to get things done, moral character that will keep from getting slack, ability to get along with an employer, and the ability to handle some hired help.

With these qualifications the demand is greater than the supply, though the supply of incompetents is greater than the demand.

### How to Land a Job

There may be requests to the writer from would-be back-to-the-landers to get them jobs like that. There is no use doing anything of the sort. No man with sense will hire an inexperienced man or one of whom he knows nothing. The only opening is to head back to a promising section of country and start in as farm hand, then with gumption and ability, to work along to the management of a small place, and then perhaps to renting, or working on shares; then to the purchase of a place, on a shoestring or otherwise.

Lalley-Light  
Safer  
Brighter  
Better  
in the Barns

## Preferred Because of its 7-Year Success

In the past year Lalley-Light has won distinct preference among electric light plant buyers, because of its more than seven-year record of success. This success has been registered in practical, everyday use on thousands of busy farms. Since the first Lalley-Light plant was sold, down to the present time, we do not know of one that has worn out in normal service. We do not know of a single dissatisfied owner. Lalley-Light stands high because it is scientifically designed and built, primarily and expressly, to furnish electric light and power for farm use. It has proved its low cost, its absolute safety, its reliability, wherever it has gone. It has brought new comfort, convenience and cheer to every farm family that has installed it. It saves time and work. Now, more than ever, Lalley-Light is needed to help the farmer in the extra work made necessary by the increased production of war-time. Write to us today for complete information, cost of the complete plant delivered to you, and name of nearest dealer prepared to show you Lalley-Light in actual operation.

Generating Plant is 27 inches long, 14 inches wide, 21 inches high. Storage battery is included in complete outfit.

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscribers must have mentioned the Cultivator when writing the advertiser.

## THIS WEEK'S COVER

The mammoth bronze bust of Frederick the Great, presented to this country by the kaiser and displayed in Washington, has been consigned to oblivion by order of the President. It never meant anything to this country, or if it did, it was a warning which was never heeded. On the other hand, Liberty Enlightening the World, presented to us by France, is loved more than ever and is one of the bonds between the two republics. We hope it will not be long before Liberty's arm will be lengthened and strengthened, and our forces, alongside the French and British, will stay the flood of Huns endeavoring to crush Liberty. We have used Liberty's torch on the cover of this issue because of its appeal to all true Americans. It must be kept alight. At this moment the effort to keep it alight is best advanced by the purchase of the third liberty bond issue. The country is answering nobly, and it now appears that the greatest over-subscription any bond offering ever had will be secured by this campaign. Farmers may feel that their effort is best given to the producing of crops and using of all possible means to that end, but in addition we may all have part in the liberty loan drive.

—LIBERTY BOND—

## TRACTOR WEEK

The producing interests of California will have their eyes on the University Farm at Davis this week. We feel perfectly safe in prophesying that the attendance at the demonstration will be immense and the display of tractors and tractor drawn implements will be an inspiration, especially in a year when the needs of our country appeal to all producers. We expect to pass on some of the lessons of the Davis demonstration to our readers next week.

## HONOR COUNTIES

Perhaps it is a little early to give the honor list, for it will be greatly lengthened when all of California's counties have finished their liberty loan campaign, but just for the one first week of the campaign, here are the counties which went over the top and subscribed their full quota in the first fourth of the campaign: Yojo, Monterey, Lake, Kern, Madera, Napa, Colusa, Trinity, Nevada, Stanislaus, Plumas. Some communities like Saratoga, Kerman, Johnsville, Del Rey and others are 100 per cent over.

—LIBERTY BOND—

## MORE CASTOR BEANS

The castor bean propaganda which began some weeks ago and which fell so flat because, as it now develops, it was used by unscrupulous promoters to advance selfish interests, has again been taken up by officials of the army, and the situation is now being explained to California. Although late, it is anticipated that 10,000 acres will be planted in this state within the next few weeks. The government urges that where a farmer is so situated as to produce food on his lands, such lands shall not be used in castor bean production. Five thousand acres has already been contracted for, and Henry S. Gane of Santa Barbara is pushing the campaign for the other 5000. Producers are to receive \$3.15 per 46 pounds, or \$6.85 per hundred.

—LIBERTY BOND—

## PEACE AT ANY PRICE

One of the strongest forces in the United States working for a successful conclusion of the war is the League to Enforce Peace. Its president is William Howard Taft who once remarked that he was in favor of peace at any price, and added; "The price of peace at this moment is war to a successful conclusion."

The League has now adopted as its slogan; "Win-the-war-for-permanent-peace" and; "Our object is to sustain the determination of our people to fight until Prussian militarism has been defeated."

It is either millions for defense or millions for tribute, and America's answer is being shown in the wonderful answer to the appeal to buy liberty bonds.

—LIBERTY BOND—

## IS IT NEEDED?

Why is a fish and game commission? There are times when we feel that this commission has served a purpose in preserving our wild life which adds much to the attractiveness of mountains and sea, but when it stands in the way of economical food production in times of stress such as the present, the question is pertinent, "Why this commission at this time?" Farmers are appealing for relief from the pest of rabbits, and consumers the state over are appealing for cheaper fish, the price of which has made it a luxury, even for the well-to-do. Fish should be the cheapest food on earth, and with the greatest ocean in the world on our western border let's have restrictions removed, at least sufficiently that the price of this healthful food may be brought within the reach of common folks.

—LIBERTY BOND—

## VALUE OF STATISTICS

The department of agriculture and many state agricultural institutions succeed in gathering a fund of information as to the normal production and as to the estimated production of crops, which is of immense

value to the entire country. The value of these statistics has been appreciated by many, but never as this year. The saving of a great portion of the world from starvation is made possible by knowledge of the world's shortage. There are not many years in the world's history when such value will be placed upon this knowledge as this year, but we hope especially that our own California board of agriculture will appreciate the need of some careful work along this line. The board has a competent statistician; his force should be increased and the state be given opportunity to know itself.

—LIBERTY BOND—

## THE SEASON'S CROPS

The apricot grower, and in fact every fruit grower, has a vital interest in knowing the coming season's output, and, unfortunately, it is not possible that he should know with any degree of definiteness, but he may at least know as much as the buyer with whom he has to deal. True, this question is not so vital since cooperative effort is securing more satisfactory marketing for the greater percentage of California fruit growers, but, at best, give us the facts so far as they can be determined. The Cultivator is much later in its campaign to secure this information than in former years. Some growers have felt that the season was from two weeks to a month later. Cultivator letters are out in all sections asking, and at this late season we expect a fund of information which will help everyone who has fruits to market. Some answers to our letters have already come back with indications that 100 per cent crop is possible. More next week.

—LIBERTY BOND—

## This Week's War News

The Turks are attempting to occupy Crimea.

Shipment of food supplies from the United States and Canada to the Allies during March aggregated 1,100,000 tons.

California's quota of the 150,000 men who are called to army cantonments, movement to begin April 26, is 4363. Oregon's is 293; Washington, 1593; Arizona, 470.

The Bolsheviks in Vladivostok are accused of sniping at Japs. Russians are protesting against Japanese troops remaining in that city.

It is rumored there is great activity at all naval German bases, especially at Kiel, and an important naval engagement is anticipated.

In Mesopotamia the British have been quiet along the Euphrates and have penetrated to a point 85 miles northwest of Hit, recently capturing in excess of 5000 Turks.

A British fleet of torpedo boat destroyers made a dash into the German mined zone in the North Sea and sank ten Hun mine layers and returned to the open sea without loss.

The British forces in Palestine have destroyed the Hedjaz railroad line. The raiding column has advanced over the Jordan 21 miles. The British have captured many prisoners and much war material.

In Finland the Red Guard has suffered reverses at the hands of the White Guard who are assisted by the Germans. Additional German forces are being landed, and it appears Germany will dominate in the formation of the government.

Answering the rumor that American soldiers killed in battle are stripped of their uniforms before burial,

Acting Quartermaster Goethals says: "I beg to say that there are no such rules and regulations and that such practice does not obtain."

Robert Goldstein, a Los Angeles promoter and exhibitor of a film which has been declared a violation of the espionage act, has been found guilty and is now subject to a 22 year imprisonment and heavy fine, sentence not yet pronounced.

The submarine sinkings reached the lowest level last week of any week since the submarine campaign was begun more than a year ago. The total was only four vessels of more than 1600 tons, two, less than 1600, and two fishing boats. Eleven other vessels were unsuccessfully attacked.

The present moment is witnessing America's greatest movement of troops. No announcements are made, but it is rumored that at least 150,000 Sammies are crossing the Atlantic monthly. The military needs have been so great that passenger traffic in many sections has been entirely suspended.

The mammoth collier Cyclops from a South American port coming up the Atlantic Coast has not been heard from since leaving a West Indian port, and speculation is rife as to what has become of the vessel. It was a 19,000 ton vessel and was loaded with manganese ore. She carried 293 men, several of whom were Californians.

Europe has been stirred by the revelations of the French government as to a letter from Emperor Charles proposing a separate peace in which the emperor asserts that France should retain Alsace-Lorraine and that Serbia and Belgium should be restored. This has created a situation between the Imperial German government and that of Austria which is decidedly strained. Emperor Charles denies having written the letter. Count Czernin has tendered his resignation as premier, which has been accepted by the emperor.

The response to the call for liberty loans is wonderful. Literally thousands of the towns of the country are already over the top with more than their quota. In the 12th district (Pacific and mountain states) alone nearly 200 towns and counties are entitled to the honor flag. Eleven California counties went over the top the first week of the campaign. San Francisco and Los Angeles are making a fine campaign. Los Angeles promises to go over the top long before the 30 day campaign ends. Some of these counties are entitled to special honors because of 100 per cent increase over their quota.

The world's greatest tragedy is still being enacted in northern France. The force of the enemy's drive has been diverted from Amiens far to the north, and the aim now seems to be to drive the Belgians and British entirely from Belgian territory and capture Calais. The most important point yet captured is Ypres. This point is a railway center and distributing point for the British forces. Every day shows a slight yielding on the part of the British lines, and at this writing (Wednesday) it appears that the Messines Ridge, which has been one of the strongest fortified positions the British forces have held, may be forced to give way. The American army appears to be taking part in the battle, but only in connection with the British and French armies. As the pressure has been lifted from the southern end of the line, the French have made counter attacks and retaken some valuable ground. South of Verdun the line has been inactive.

## Northern California

Have you an honor flag?

Meridian, Sutter County, reports activity in sugar beet planting.

Sutter County council of defense reports many purchases of war savings stamps by Hindus.

A state highway is to be constructed from Lake County into Sonoma through Railroad Gap.

The cannery at Oroville hopes to double its output of canned tomatoes during the coming summer.

A Williams farmer recently sold 1800 bags of barley, at \$3.80 1/4 per hundred, which was record price.

A complete farm labor and farm production survey of Nevada County has been made by volunteer enumerators.

Farmers at Ord, Glenn County, have applied for permission to incorporate a cooperative grain elevator company.

Prune growers around Cloverdale, Sonoma County, are being appealed to to stand by the Prune and Apricot Growers' Association.

A farm center has been organized at Guerneville, Sonoma County. The packing house at Grafton, Sonoma County, is being enlarged.

James Mills Orchard Corporation is now making a planting of five acres of jujubes and five acres of assorted persimmons for commercial purposes.

The irrigation system of the Anderson-Cottonwood irrigation district is nearly completed. One flume connected with this system has cost \$40,000.

Ladybugs are being forwarded by the state insectary to aphids infested points at the rate of about 150 quarts daily. Most of the shipments go to the Imperial.

Practically all of the asparagus canneries along the river are in operation. The wholesale market is running between four and eight cents according to quality.

Butte County reports record price on paddy rice, namely five cents per pound secured last week by the Pacific Rice Growers' Association. All warehouses are now empty.

Early April frost did serious damage to early potatoes and some vegetables in Butte County. Smudging is reported to have saved many an orchard which was heavy with bloom.

California Ripe Olive Company at Oroville, Butte County, is engaged in canning asparagus and other vegetables. This concern will soon be in operation 12 months of the year.

California produced in 1917 on 82,000 acres 280,000,000 pounds of rice, and it is estimated that the state will produce this year more than 400,000,000 pounds. The state is now producing more than one-sixth of the rice of the entire country.

The concrete merchant vessel, Faith, recently launched at a Pacific port, is to be given its trial trip on May day. It is seldom that a vessel of such tonnage has been constructed in such marvellously short time.

The United States food administration is calling a series of meetings of cattlemen throughout the northern end of the state. They are invited to cooperate with the forest service and the California Cattlemen's Association. A meeting was held at Oroville on the 16th.

Have you an honor flag?

Kern County has 277 miles of improved highway.

Crows Landing oversubscribed and gets the honor flag.

Turlock, Stanislaus County, is to have a peach packing house.

Many large silos are being erected at Gilroy, San Benito County.

Woodlake, Tulare County, is shipping grapefruit of high quality.

Kings County bee keepers are organizing a county association.

Tulare County's output of Valencias will aggregate \$300,000 value.

Kern County's farm bureau is now conducting a silo-sorghum campaign.

Tulare County is going on the card system for distribution of wheat flour.

The Turlock cannery expects to handle between 1300 and 1400 tons of peaches.

The value of Tulare County's exports of foodstuffs for 1917 exceeded \$20,000,000.

The directors of the Turlock irrigation district are planning a drainage system.

Kingsburg, Fresno County, will have a 50 by 80 cannery exclusively for peaches.

Beekeepers of Kings County recently met at Hanford and discussed disease control.

Fresno County estimates that she will plant at least 2000 acres of long staple cotton.

Porterville, Tulare County is packing its Valencias. The output will be about 150 cars.

Oakdale, Stanislaus County, will plant 1500 acres to rice. Growers are being guaranteed \$4.10.

Many California towns have already gone over the top and are entitled to the honor flag.

Milo, Gyp and other kinds of substitute flour are being sold in practically all markets of the state.

The Milk Producers' Association of Central California recently convened in Modesto, Guy Miller presiding.

The California Peach Company, Inc., has decided to spend \$50,000 in advertising the coming season's output.

A band of sharpshooters at Hanford is using jack rabbits for targets, and the members recently returned with 200.

A road extending westward from Modesto to the San Joaquin is to be greatly improved, and new bridges will be built.

Prune growers who are profiteering at the expense of the association members are not in good form with loyal fruit growers.

Stanislaus County farm bureaus are appealing for a revision of grain prices which will put barley and other grains on a basis of equality with wheat.

The San Jose Grange of Husbandry goes on record "as opposed to the many frivolous amusements and extravagances now practiced by the public."

An expert in cotton culture and connected with the department of agriculture, is in the San Joaquin Valley giving advice to prospective cotton planters.

## Carbon Bisulphide as a Fumigant

**A**N ORGAN devoted to fire in-  
surance interests is com-  
plaining because farm pa-  
pers recommend fumigation  
of beans and seeds with car-  
bon bisulphide which is an extremely  
inflammable gas and there is some-  
times carelessness in its use. The  
same objection can be raised as to  
the use of dynamite or gasoline or  
many other agents which are most  
beneficial in farming operations.  
Farmers must be careful in handling  
any of these deadly chemicals. They  
must also produce clean seed and  
clean beans if they will farm at a  
profit.

When one takes charge of dynamit-  
ing operations it is presumed he  
knows the deadly nature of the agent  
he is using. With carbon bisulphide,  
every farmer understands that it is  
not only inflammable but extremely  
explosive when the fumes are mixed  
with air. No lantern or fire must be  
brought near it; neither may it be in-  
haled without injury. This is also  
true of hydrocyanic acid gas which,  
while not explosive, has been the  
cause of deaths to humans in the or-  
chards of California, and this because  
of momentary thoughtlessness.

In using carbon bisulphide bear in  
mind that it is much heavier than air.  
Place it over the grain in the bin in  
shallow pans or containers, and as the  
gas fumes rise they will settle through  
the stored grain. If there are 100  
cubic feet of space in the bin use  
about three pounds of the liquid bi-  
sulphide, or four pounds will treat  
about 100 bushels of grain. The best

results are secured at about 70 de-  
grees Fahrenheit. Before distribut-  
ing the bisulphide all cracks should  
be made gas tight, and as soon as  
distributed the door should be closed  
and its cracks caulked. Leave expos-  
ed to these fumes about 24 to 36  
hours. Permit no lantern near it  
when doors are open and allow to  
air out for some time before human  
beings enter.

Regarding the quantity of bisul-  
phide to use Mr. Swain of the entomol-  
ogical division of the university sta-  
tion at Riverside writes:

"That a dose of less than three  
pints of bisulphide to each 100 cubic  
feet of space is not efficient was  
learned through conversation with Dr.  
H. B. Frost of the plant breeding de-  
partment. Personally I have no di-  
rect information along that line, but  
Dr. Frost has done more or less fumi-  
gation in connection with his work on  
the breeding of varieties of beans,  
and he finds it true that at least three  
pints to each 100 cubic feet of space  
is necessary to obtain a good killing.  
This he claims will not kill every wee-  
vil or egg, but if a stronger dose is  
used the germinating power is apt to  
be seriously impaired. For beans for  
consumption, however, a stronger  
dose, say of four pints to each 100  
feet, can be used."

Fumigation of stored grains is  
treated very fully in a leaflet issued  
by the agricultural experiment sta-  
tion, University of California, Berke-  
ley, "Fumigation of Stored Grain,  
Dried Fruits and Other Products" by  
E. R. de Ong.

## Weekly Report on Condition of Truck Crops

By United States Department of Agriculture, Bureau of Estimates,  
San Francisco

Condition of truck crops for the  
week ending April 6, 1918:

### Southern California

Cantaloupes are making an excel-  
lent growth of foliage and are setting  
well. Reports continue to predict an  
early season for shipments, and a  
heavy yield per acre.

Asparagus. The situation is report-  
ed satisfactory with shipments in-  
creasing and the season much the  
same as last year. Shipping will  
probably continue three weeks longer.

Potatoes have been planted very  
heavily the past two weeks. Present  
indications are that the acreage will  
be normal, though not as large as  
last year's, which totaled 15,000  
acres for the southern portion of the  
state. The first car was rolled last  
year May 10, but the main plantings  
did not mature until June, July and  
August. While the general planting  
is about three weeks late, the crop is  
now growing very rapidly and carlots  
are expected from Orange County the  
first part of June and from Los An-  
geles County the latter part of June.

Cabbage is the principal vegetable  
shipping from Los Angeles and Or-  
ange Counties, but shipments will be  
much heavier the last of the month.

Peas. Shipments to Eastern mar-  
kets have stopped for the season.

Lettuce continues to be poor in  
quality and the supply is small. Plant-  
ings for spring shipments are also  
short.

Celery seedbeds are starting well,  
but estimates of acreage which grow-  
ers intend planting are much shorter

than last year's. Celery for mixed  
cars is going out of cold storage.

Tomatoes. Preparations are being  
made for planting a larger acreage  
than last year. Some damage has been  
done to seedbeds by flea beetles.

The condition of truck crops is re-  
ported as follows for this week and  
the week ending March 30, respective-  
ly: Asparagus, 89 per cent, 90 per  
cent; cabbage 65 per cent, 65 per  
cent, 65 per cent; cantaloupes 92 per  
cent, 92 per cent; cucumbers 89 per  
cent, 88 per cent; lettuce 65 per cent,  
65 per cent; onions 95 per cent, 75  
per cent; potatoes 92 per cent, 91 per  
cent; strawberries 84 per cent, 84 per  
cent; tomatoes 83 per cent, 83 per  
cent; watermelons 90 per cent, 91 per  
cent.

### Central California

Asparagus came on so rapidly the  
early part of week that the labor sup-  
ply was inadequate to handle the  
large supplies and large losses of the  
product resulted.

Weather turned cold on the second  
and subsequent frosts have destroyed  
all green grass above the ground.  
Shipments are expected to be resum-  
ed about the eighth. Canneries opened  
this year on scheduled time: April 1.

Artichokes are being shipped East  
at the rate of about ten cars per day.  
Present indications are that supplies  
will continue through May and ship-  
ments will proceed if transportation  
and markets are satisfactory.

Rhubarb shipments to Eastern mar-  
kets have been discontinued, closing  
a very short shipping season.

Correspondence with the advertisers in the Califor-  
nia Cultivator will convince you that their articles  
will save you money.

Potatoes are reported slightly damaged from frost. An increased acreage in the Colma districts will produce the first potatoes for shipment. Sacramento started shipping in carlots last year the first week in June.

Cantaloupes. A special reporter states that frost destroyed 25 per cent of the cantaloupes at Turlock on April 4. Soil conditions are favorable and planting is proceeding, but is said to be 15 days later than last year.

Spinach canning is in full blast and the large crop has taxed the canners' ability to handle the product.

Strawberries. No frost damage of consequence is reported, but it is not expected that the crop will equal last year's record production. It is estimated that 30 to 35 per cent will go to canneries.

The condition of truck crops is reported as follows for this week and the week ending March 30, respectively: Asparagus 87 per cent, 87 per cent; artichokes 70 per cent, 72 per cent; cabbage 90, per cent, 90 per cent; lettuce 90 per cent, 90 per cent; onions 92 per cent, 92 per cent; potatoes 76 per cent, 78 per cent; strawberries 89 per cent, 89 per cent.

—LIBERTY BOND—

**WAR GARDEN BOOK**

"War Vegetable Gardening and Home Storage of Vegetables" is the name of a 32 page booklet filled with valuable information for the war gardener. It is in two parts, Part I, War Gardening Manual, and Part II, Home Storage Manual. It is published by the National War Gardening Committee, Merrill Building, Washington, D. C. Copy of this manual may be obtained upon request to the committee.

# Cutting Gladiolus Bloom

By H. E. Meader in The Flower Grower

Of four different lots of Gladiolus America the first lot was cut with no foliage left on the plant with the exception of the two bottom leaves, the second lot with four leaves, and the third with six. On the fourth lot no flowers were cut, as no buds were allowed to form.

When the bulbs were dug, those with two leaves were very poor, in no case was the new bulb larger than the old one and in most instances the plant had died before maturing. There were very few bulblets.

Those with four leaves were very good and seemed well ripened and of normal size, with a good yield of bulblets.

Those with six leaves perhaps averaged a little higher quality, and slightly larger but not a great deal.

The fourth lot were in no way better than the third.

This proved to my satisfaction that no less than four leaves should be left on the plant for best results. However, in most cases the flower stem

Insert the knife with edge pointing down at "1" following down the leaf to "2," turn the edge against the

Corm of Gladiolus

Large corm showing method of reproduction by use of little corms formed each year around mother corm.

flower stem and cut same not quite through.

The stem may be bent sharply towards the cut and will snap off and pull out of the leaf socket, making a neatly finished job and allowing the greatest possible length of stem.

—LIBERTY BOND—

## THE SQUIRREL CAMPAIGN

As an inducement to the schools of the state to enter into the spirit of conservation and aid in the squirrel campaign, State Horticultural Commissioner Hecke is offering prizes to high and grammar schools.

The sum of \$100 is to be divided among the high schools as follows: \$50 first prize; \$30 second, \$20 third. Grammar schools: \$50 first prize; \$30 second prize and \$20 third.

In addition to these prizes the chambers of commerce and other commercial bodies in the respective counties of the state will offer additional prizes which, put together, will amount to a considerable sum.

—LIBERTY BOND—

## TOMMY'S HARD LUCK

Tommy came crying out of a room in which his father was tacking down carpet.

"Why, Tommy, what's the matter?" asked his mother.

"P-p-papa hit his finger with the hammer," sobbed Tommy.

"Well, you needn't cry at a thing like that," comforted his mother.

"Why didn't you laugh?"

"I did," sobbed Tommy, disconsolately.—Kirsch Sales Booster.

Method of Cutting Gladiolus Blossom Stalk

should be plenty long enough, if cut to leave five or six leaves.

I have taken the liberty of explaining my way of cutting as it allows two or three more inches of flower stem without taking an extra leaf than the method of cutting sometimes advocated.

**A Size for Every Engine and Motor**

Piston rings prevent escape of gas and power. They must fit exactly or there is compression leakage, excessive carbon, and power loss. The scientific construction of

**McQUAY-NORRIS LEAK-PROOF PISTON RINGS**

assures equal pressure all around the cylinder walls. They are made in all sizes to fit every model and type of engine, automobile, tractor, etc.—every size accurately gauged to fit the particular model of motor.

Your local dealer or garage has—or can get—our data book of piston ring sizes of practically every engine and motor made. This will tell exactly what rings you need. Complete size assortments are carried by more than 300 jobbing and supply houses all over the country from which you can be quickly supplied. Over 2,000 unusual sizes and oversizes—all widths and diameters—are kept constantly on hand at the factory ready for prompt shipment anywhere.

**McQUAY-NORRIS Superoyl RINGS**

A special ring for engines that pump oil. Used in top groove only of pistons to control excess oil, with McQuay-Norris **LEAK-PROOF** Rings in lower grooves to insure maximum compression and fuel economy.

SEND FOR FREE BOOKLET "To Have and to Hold Power"—a simple, clear explanation of piston rings, their construction and operation.

**Made by Dr. O. M. Franklin, Originator**  
Holds the record of immunizing more than a Half Million Calves against Blackleg with

— only one handling of each calf — has stood the test of time—easy and safe to use—cannot give the disease to calves or spread it in pastures.

Leading cattlemen use it exclusively and recommend it to their friends—ask any of them or write to the nearest office for references and free Booklet on Blackleg.

## Big Meeting of Big Cattle Men

Written for California Cultivator By C. A. Briggs

THE California Range Cattlemen's conference at Davis, April 8 and 9 was largely attended. Many able papers and addresses along the line of the need of better feeding methods and improved marketing conditions, together with the all important foundation of better cattle, made every session of value.

On the evening of the 9th the Pacific Coast Hereford Cattle Breeders' Association held a banquet, and every one got into a good condition for the first annual sale on the 10th. The officers elected for the ensuing year were those of last year: President, H. H. Gable of Esparto; vice president, W. D. Duke of Likely; secretary-treasurer, W. R. Madden of Dixon.

Sale day brought a goodly crowd with brisk bidding the special feature,

Fred Reppert of Decatur, Indiana, acted as auctioneer, Ord L. Leachman of Orland and Frank Hatch of Modesto assisting as ring men.

Forty-five head of registered Herefords were sold at an average price of \$350 per head. The top animal was a fine bull, Reuben 645572, bred and consigned to the sale by J. H. Cazler & Sons of Wells, Nevada, sold to W. D. Duke of Likely for \$1350. Buyers were present from a number of states, ex-Governor Packard of Arizona being one of the purchasers. As a first annual sale it was an unqualified success and placed a fine lot of animals in the hands of the stock men of the state.

The consignors to the sale were Cazler & Sons, Wells, Nevada; D. O. Lively, San Francisco; H. H. Gable, Esparto; W. D. Duke, Likely; W. J. Bemmerly, Woodland, and the Simon Newman Company, Newman.

## The Hereford Sale

Written for California Cultivator By W. D. Johnston

The total for the 46 head sold was \$16,215. The average price for the whole lot was \$351 with the bulls averaging \$352 and the cows \$350.

The most consistent buyer at the sale was S. R. Crowe, Hayward, who purchased 11 head, paying \$2640 for the lot.

The largest consigner to the sale was W. J. Bemmerly, Woodland, who sent 14 lots.

### Red Cross Donations

The Hereford bull calf, Our Folly,

which was donated for the benefit of the Red Cross, brought \$512.

The calf was donated by W. D. Duke, a Hereford breeder from Likely. The selling of this calf was one of the features of the sale. Dr. DeWitt, who is president of the American Hereford Breeders' Association, was the first buyer. He paid \$260 for the animal and then turned it back for auction again. The next buyer was H. T. Liliencrantz of Hollister, and he bought the calf for \$200. Donations from other breeders brought the total for the Red Cross benefit up to \$512.

## First Spring Sale of Shorthorns

Written for California Cultivator By C. A. Briggs

On April 11 in San Francisco the California Shorthorn Breeders' Association held a most successful sale of 63 registered Shorthorns from 11 herds, Fred Reppert, Decatur, Indiana, acting as auctioneer with Ord L. Leachman of Orland and Frank Hatch of Modesto assisting in the sales ring. Consignors were: Alexander & Kellogg, Suisun; Wm. Bond, Newark; W. M. Carruthers, Mayfield; H. M. Elberg, Woodland; A. W. Foster, Hopland; T. S. Glide, Davis; London Estate, Glen Ellen; Ormondale Company, Redwood City; Pacheco Cattle Company, Hollister; Paicines

Ranch Company, Paicines; and the University Farm.

The offerings were of very high quality, prices good and bidding went without a drag. A strong feature of the sale was that no consignor bid on the stock sold, all the animals going into the herds of other stock men. The average price on 29 females was \$476; on 34 males, \$307; total average, \$391.50. Top price went to W. M. Carruthers of Mayfield, three cows in his consignment going for \$1200, \$1450 and \$1500 and a bull which was the highest priced animal in the sale going for \$2000.

## Field Notes from the Live Stock Men

One of the most disastrous accidents that has happened to the Hampshire breed occurred at the Llano Vista Rancho last week when Sioux Queen, the famous old grand champion sow at the San Francisco world's fair, died. She had just farrowed a fine litter of pigs, 17 perfect belts, which were by Langdon's Choice, an excellent Hampshire boar. They have many other fine prize winning animals left in their herd, including the first and second prize winners at San Francisco, and many others of equal merit. They also have about 250 spring pigs.

Roy Dawson of Gardena has a splendid junior yearling Hampshire boar that is siring some extra fancy pigs. It is time well spent to visit his ranch.

F. L. Hall, the pioneer Berkshire

breeder of Perris, has added some excellent mature sows to his already famous herd. Mr. Hall is fitting a splendid herd for the Los Angeles Liberty Show.

Tom Blodger of Gardena has two fancy boars by Director, which has recently been placed at the head of the Denker herd at Sagus. He was a winner at the world's fair at San Francisco.

Chas. Shattuck, a well known architect, and also breeder of Jersey cattle, of Los Angeles, has branched out into the pure bred hog business, having recently bought some of the best sows to be obtained at the Conejo Ranch. He purchased two under year sows and two junior yearling sows bred to Duke's Allen, grand champion boar at Sacramento. Duke's Allen is directly related to E. N. Manley's

Pan-Pac. Expo.

## Flush Out the Cow After Calving

Thorough irrigation of the uterus and vaginal tract with a reliable antiseptic, once or twice after a cow drops her calf, will give you the greatest insurance you can have against Barrenness, Abortion, Retained After-Birth, etc.

B-K is more effective than lysol, carbolic acid, Lugol's solution and oily coal-tar disinfectants, which all make the uterus more acid, and do not clean. B-K heals the uterus and vagina by cleaning and removing the slime and acid. It kills the germs because it is much more powerful. The application of B-K as a douche is simplicity itself.

If your dealer does not have B-K—send us his name.

FREE BULLETINS—Send for complete information—"trial offer" and bulletins—No. 52, Contagious Abortion—No. 138, Calf Scours.

## Shorthorn Cattle and Berkshire Hogs

Shorthorn herd headed by Count Glory 426982, grand champion at the California State Fair, 1916. Berkshire herd won Premier Exhibitor's banner at P. F. I. E.

513 Hearst Building  
San Francisco

CARRUTHERS FARMS  
Mayfield, Cal.

When writing advertisers, mention The Cultivator.

April 20, 1918

\$5000 Senator, grand champion at Omaha.

Ex-Vice-President Fairbanks has just recently purchased a full herd of Hampshires from the Llano Vista Rancho. His herd boar is by Langdon's Choice and out of Sioux Queen, and his sows are from very prominent families of the breed.

Clayton N. Slocum of H. P. Slocum & Sons of Willows, reports 78 inquiries for sows in the last 30 days. He is much pleased with his advertising in the Cultivator. The \$1000 sow, Model Lena 294004, which Mr. Slocum brought out in his last importation from the East, farrowed 11 fine pigs, and two of the boar pigs are spoken for already.

Butte City Ranch, Butte City, breeders of Berkshire hogs, has offered a silver trophy cup for Duroc-Jersey swine to be shown at the Glenn County fair at Orland, September 16-21, 1918. The breeders of registered swine of all breeds in Glenn County work in the closest harmony. All are interested in better hogs and there is none of the hard feeling that is sometimes manifested.

Hogs to the value of \$18,000 were sold at auction at Porterville and direct to packers who were called to the sale by the large offering of strictly first class stock. One report is that the farmers benefited by the plan to the extent of at least \$900 over prices which might have been received under old method of marketing. There were nine cars in the lot, two of which, purchased by Los Angeles buyers, netted the producer \$17.05 per hundred. The auction method is proving a winner.

The exhibit of sheep at the Ft. Worth fat stock show was the largest ever made in Texas. The grand champion wether sold for 25 cents per pound, and the grand champion car of lambs sold at \$18.50 each, the top for the day.

Clydesdales are selling at unheard of prices in Scotland. A four year old gelding recently sold at auction at \$1000 and a three year old filly, at \$5145.

The bureau of animal industry has quarantined the counties of Mendocino, Sonoma, San Joaquin, Stanis-

laus, Fresno, Merced, Madera, Tulare, Kings and Kern in this state because of sheep scab. Several counties in Texas, Louisiana, and other states are under the same quarantine.

The Milking Shorthorn is increasing in popularity in all portions of England and some most satisfactory sales of the milking strain have been made in this country.

At the sale of the Central Shorthorn Breeders' Association in Kansas

City early this month 191 head averaged \$282. One hundred and sixteen bulls averaged \$227, and the females, \$369.

The sale of 107 Herefords at Hutchinson, Kansas, by the Bowman Company netted \$33,485, an average of nearly \$315.

A recent sale of pure bred drafters in Chicago netted only \$330 each. Values ranged from \$50 to \$775. They were Percherons, Shires, Clydes and Belgians.

## Treatment for Worms in Hogs

The popular opinion that soda lye possesses preventive and remedial properties against worms and other intestinal parasites has, by a recent experiment carried out by the United States department of agriculture, been proven false. Hogs were fed soda lye for a period of two and one-half months and according to the report the extent of infestations increased during the course of the experiment.

The department further points out that since soda lye has no effect on parasites in the comparatively simple digestive tract of hogs, in the complex alimentary canal of cattle and sheep its opportunity to influence parasites is further lessened.

A safe and effective hog tonic and worm remedy is offered by the University of Missouri college of agriculture: Sal soda, three pounds; Glauber's salts, three pounds; copers, three pounds; sulphur, one pound; charcoal, four pounds; and common salt, three pounds.

Mix thoroughly and keep in a trough in a conveniently dry place. When the herd is seriously infested with worms it is well to use santonin six

grains, calomel four grains, per hundred pounds weight of hog. Feed in a thin slop after hogs have had no food for a day or two.

In the event that santonin cannot be obtained, satisfactory results may be expected from finely powdered copper sulphate, at the rate of a level teaspoonful to the hundred pounds weight of hogs, given in the manner recommended for the use of the santonin and calomel.

It is advisable to confine the hogs for a period of two days following the administration of the drug, in rather limited quarters apart from the regular hog lots. After the hogs are released from the pen the live worms and eggs expelled by the treatment may be destroyed by a strong stock dip solution or a coating of freshly slacked lime to prevent reinfestation.

It is a good practice to plow the hog lots and sow to rape or other forage crop at least once during the season. An abundance of wholesome forage is thus procured and the fresh soil surface furnishes conditions almost equal in cleanliness to that of a new hog lot.

## Calf Clubs

One of the most important movements in improved stock husbandry is that of organizing boys or boys and girls calf clubs. These clubs, usually limited to a local community, have accomplished wonderful results in the way of stimulating interest in live stock improvement. As a rule some enterprising bank in a community assumes the responsibility of organizing the club and advances the money for the purchase of the calves. When the calves are assembled they are appraised by breeders of experience and distributed among the members of the club by lot.

As a rule a sale to which all of these calves are consigned is set for a date from six to 12 months following the beginning of the contest. Every member of the club takes personal care of his or her calf, and when sold the difference between the purchase price, plus interest, and the selling price becomes the gross profit of the club member. We have one instance in mind where registered Shorthorn calves were used where the average gross profit on the entire offering was a little over 100 per cent.

One Illinois bank has adopted a three-year plan, and instead of buying calves, bred heifers are secured, and

at the end of the three-year period the produce from these heifers is to be offered. This places the operations on a breeding basis and will give the club members a practical experience that could not be obtained upon a short period plan. It makes practical breeders of them and insures to them a much larger margin of profit.

The American Shorthorn Breeders' Association and various state Shorthorn breeders' associations are cooperating extensively with banks and county agents in organizing these calf clubs, and through their efforts registered calves have been selected almost without exception.

—LIBERTY BOND—

### CONSERVING SHEEP

The University of California farm at Davis is conducting an experiment which may enable California to add considerably to the production of meat and wool, two commodities greatly needed by the nation. The object of this experiment is to determine the cost of producing one more crop of lambs from ewes too old or "mouth-broken" to withstand another winter on the open range. Such ewes can generally be purchased at a reasonable price by the farmer and by proper care and the utilization of waste feed made to produce very cheaply a final crop of lambs before being sold to the butcher.

Prof. R. F. Miller who has charge of sheep affairs at the University Farm at Davis says that within the last two weeks he has had over 50 letters asking for Circular No. 184 entitled "A Flock of Sheep on the Farm." Also many are asking what to do with orphan lambs.

## Churning

**T**HE agricultural experiment station at Pullman, Washington, refers to dairy made butter as scarcely ever appearing on the market now and discusses why so much farm butter is undesirable, stating most emphatically that there is no need for low quality in dairy made butter. In the matter of churning, here are some suggestions which will be of value:

### Preparing the Cream for Churning

It is difficult to lay down hard and fast rules for churning because there are so many factors that will change conditions. The principal points to observe in preparing cream are as follows. As soon as the cream is ripe, which can be determined by the glossy appearance when stirred, or when the acidity has reached about 0.5 per cent, it should be cooled to the churning temperature and kept at least eight hours before churning. This holding period gives the fat globules time to contract uniformly so that they will churn completely, thereby minimizing the loss of fat in the buttermilk. It is customary to ripen one day and cool down in the evening for churning the next morning. The cooling temperature varies with the conditions of the cream and season, and should be from 50 degrees in the summer to 60 degrees in the winter.

### Churning Temperature

This varies from 55 to 65 degrees

Fahrenheit. The exact temperature to use depends on a number of conditions. Use a low churning temperature, first, when cream is very sour; second, when cream is rich in fat; third, when the fat globules are soft, due to laxative feeds fed to cows; fourth, during hot weather when the temperature is likely to rise while churning.

Use high churning temperature, first, when the cream is thin; second, when cream is rather sweet; third, when the fat globules are hard, due to dry feeds fed to cows; fourth, during cold weather.

Cream is at the proper temperature when the butter comes in 30 to 40 minutes. Too high a churning temperature is undesirable as it causes the butter to come in the form of soft lumps rather than in the granular form. This often results in a greasy butter of poor texture, and one that has a high buttermilk content, causing it to deteriorate rapidly.

Too low a churning temperature is undesirable although this fault is not so serious as when the temperature is too high. When the temperature is low, the butter churns slowly. A low churning temperature may result in a butter that will not gather rapidly, the amount of moisture taken up may be below normal, and the butter may be brittle.

## American Jersey Cattle Club to Celebrate Golden Anniversary

The fiftieth annual meeting of the American Jersey Cattle Club will be held in New York City on May first, 1918.

This golden anniversary of the club marks 50 years of success in breed improvement, the object for which the club was organized in 1868. The original number of 40 members has been increased to 722, and new members are now being admitted at the rate of 100 per year. The fiscal year just ended on March 31, 1918, shows that the club has not been marking time in the first year of the country's part in the great war. The registrations and records of transfer have shown a marked increase over all previous years, and the present yearly registration of pure-bred Jerseys is 40,000 as compared with 400 in the first year of the club's existence. To date 93 volumes of the Herd Register have been published, and they include the names of 543,500 animals.

The Register of Merit work, which was commenced in 1903, has proved the value of year's tests of butterfat, and the progress of the work in this department has not yet been greatly hampered by the labor shortage or the high cost of feed. Breeders seem more determined than ever to select their breeding animals by production standards. A change effected in the 1917 Register of Merit volume makes this valuable information more accessible than ever. The total number of cows now having completed year's tests is 8990. Their average production is 7842 pounds of milk and 421 pounds of butterfat. The average percentage of fat in these tests is 5.27.

While there is need in these times for close cooperation among all branches of the dairy industry, the outlook from the viewpoint of Jersey breeders is deemed very satisfactory.

## Feeding Kids

**I**N A SERIES of articles written by Irmagarde Richards of San Mateo County in "The Goat World" we note the following suggestions as to feeding kids from three weeks old to weaning, and pass them on for the help of our subscribers.

There is doubtless a wide range of possible programs for feeding kids, almost any of which would give successful results with care and watchfulness. For the sake of beginners I will give the plan followed in our herd. It will at least have the merit of definiteness, and it has been tested by several years of experience. For the other breeders, with their own years of experiment behind them, it may serve as a basis of discussion. For it is not offered as a final or perfect program, and suggestions or crit-

icism based on experience would be of value to us all.

For the first three weeks the kid is left with the mother, or, if fed by hand, is given milk five times a day, about eight ounces at a feed. From three weeks on we feed three times a day, beginning with a pint at a feed and increasing to one and a third pints. Alfalfa hay and a little rolled barley are accessible at all times, in boxes so arranged that the feed cannot be soiled or wasted. At two and a half months the feeds are reduced to two a day, night and morning, and the kid is allowed to take its fill up to a quart apiece at each feed. Hay is kept always supplied, and an abundance of freshly cut green feed of some sort, and a regular feed of rolled barley or oats is given at noon, a scant pint for each kid. At three and

a half months old the evening feed of milk is omitted, and the kid is given instead a mixture of feeds which we call "weaning meal," composed of one part light bran, one part middlings, and one part milk substitute. This "milk substitute" is a mixture recommended by the University of California for raising calves without milk. Its formula is as follows: wheat flour, 30 pounds; nutrium 20 pounds; coconut meal, 25 pounds; linseed oil meal, ten pounds; dried blood, two pounds. The nutrium is explained as a dried skim milk product. The price is very high. Last spring I paid 16 cents a pound for a 50-pound tin. As for the dried blood portion of the formula it has never been convenient to obtain it, and I have omitted it. Having mixed the milk substitute meal, I take equal parts of this mixture, and of bran and of middlings, mix well, and sack up enough to last for some time. When the kids have been put on one feed of milk a day, in the morning, I feed them at night a pint apiece of this meal, adding at first a little barley, as they do not like the fine meal at first, but soon grow fond of it, and are as eager for it as for their rations of milk. As soon as they are eating it well, I discontinue the barley, and at four and a half months, I discontinue milk entirely, and feed the weaning meal, a pint apiece, in the morning, and a pint apiece of rolled barley or oats at night. By the time the kid is five and a half months old, I discontinue the weaning meal and the kids go on to the regular rations of the rest of the herd.

The use of this program of feeding has produced for us excellent results. As the milk rations are reduced, the kids suffer no loss in growth, they are not troubled with scours, they finish their change of coat rapidly, and they present, when fully weaned, a thrifty, well rounded body, and a smooth, glossy coat.

Wishing, however, to submit this program to the test of the science of food values and scientific rationing, I

## Duroc-Jersey Get-Together

The National Duroc-Jersey Record Association, with offices at Peoria, and the American Duroc-Jersey Swine Breeders' Association, with offices at Chicago, have agreed to consolidate, at least committees duly appointed have canvassed the situation and decided that the only sensible thing to do is to effect the consolidation as quickly as possible.

To that end the managements of both associations sent out sometime ago ballots on which members are to express their opinions as to consolidation; as to which city, Chicago or Peoria, should be used as permanent headquarters; if Peoria is chosen, should the new association use the National Association Building constructed there; if Chicago is chosen, should the present offices of the American Association be used; and other points of minor importance will be balloted upon.

The committee in making its report suggests that both Secretary J. R. Pfander of the National and Secretary R. J. Evans of the American be retained as secretaries of the new consolidated association. Each association is to contribute \$25,000 or more to the treasury of the consolidation. The board of directors is to be composed of nine members; five of whom shall be selected from stockholders west of the Mississippi; four

sent it to Professor Voorhies, of the department of animal husbandry at the university farm.

He says: "Although we do not feed as often as you do, we know that it would probably be the best thing to do. It might be well to mention in your discussion that in case a person cannot provide five feeds per day at the start, three feeds will do. All of our animals have been raised with only three feeds per day for the first couple of weeks.

One matter which I scarcely agree with you on is the keeping of rolled barley before the kids at all times. It seems to me that this is rather unnecessary, and I would prefer to feed a little after each feed of milk, especially as rolled barley comes at such high prices at the present time. However, it does not do them any hurt and I merely looked at it from the expense side. The only other suggestions which I might have would be the concentrate feed which you give the kids when you are feeding only one feed of milk per day. The mixture which you have is a splendid one, except that the part of meal which has been recommended as a milk substitute by us, at the present time, is rather expensive. It seems to me that a mixture of ground oats, ground barley, middlings, two parts each, and linseed oil meal one part, would be just as efficient as the mixture which you mention, and I am sure it would be considerably cheaper. This is really, I believe, in the long run, an improvement on the mixture of bran, middlings and the milk substitute, because bran and midlings are really about the same in composition, although their physical makeup is different, I believe that nature takes care of this when you state that the kids seem to like a little barley with this fine mixture which you feed.

"You will find that either barley, milo maize, or oats would answer this purpose, preferably oats, because oats are known the world over as a feed for young growing stock."

from those east of the river. The annual shall be held in Chicago during International week.

—LIBERTY BOND—

**USE PURE BRED BULLS**

One of the most startling statements about the cattle industry in California was brought out recently by an inspector representing the California Cattlemen's Association. It was to the effect that the percentage of calves dropped from range cows in his section of the state was only 52. This meant that only about half of the cows running in the range are dropping calves. In the range cattle sections of Texas and New Mexico, anything less than 75 per cent is considered poor management.

If the inspector who brought in this report could have gone farther and shown the average cost of the bulls in use, it would have demonstrated that the majority of them were little better than scrubs.

A very pronounced movement is on foot to pledge the range cattlemen of California to the purchase of pure bred bulls at least. A further movement on foot is to list the number of registered and pure bred bulls in California that are available for service. These and other topics of equal importance and interest were discussed at Davis on April 8 and 9, preceding the auction sale of registered Herefords.

## WAR-TIME RATIONS

Continued from Page 495

which the expectation of reducing the production price of the milk must be based. It is well known to all that feed prices are, in general, 100 per cent above the average figures that prevailed a year or two ago. Barley used to sell at \$1.00 or \$1.50 a hundred and is now \$3.50 a hundred or more. The average San Francisco market price of alfalfa hay was \$10.50 a ton for the years 1913-16, inclusive. During the past season it has sold at \$25.00 a ton or more. The average price of wheat bran up to 1917 was \$27.00, now it is \$34.00 to \$35.00—if you can get any. Mill feeds in gen-

Back the Tractor Up and Shell the Corn  
Corn sheller is becoming more common in California.

eral have increased less in cost than any other class of feeding stuffs because of the action of the food administration in fixing the price which millers may charge, at 38 per cent of the average cost to the mill of one ton of wheat, a very wise move that may save our dairymen more money than the entire cost of the food administration to the state, and will be likely to affect the price of all other concentrates as well. If farmers can buy bran under \$40.00 a ton, they are not likely to buy large quantities of other concentrated feeds costing \$60.00 or more, which careful trials and feeding experience have shown to possess only a slightly higher feed value for the purposes intended.

One way of decreasing the production price of milk is to pay less for the feeds bought. This can be accomplished by eliminating the middleman. Cooperation in purchasing feed stuffs is now a regular feature of the activities of the farm bureaus in several counties, and in many communities neighbors are combining in buying feed in carload lots. Just now it is more a question of getting grain feeds at all than of the price to be paid, but this condition is only temporary. High prices are, however, likely to continue for years, and by cooperative buying these may be appreciably reduced. Cooperation is the watchword of the age, and our farmers are gradually coming to appreciate its importance which extends in other directions than that of saving some money in buying, desirable as that is.

There are special reasons why dairymen should study the feed market these days and acquaint themselves with the characteristics and feeding value of the available feeds. Values have been turned about during the last year, and in the case of many feeds the market price does not represent an equivalent feeding value. The number of available feeds in this state is at best very limited. We do not have the glucose, starch, or hominy-factory feeds, nor the by-products from the distilleries and breweries that are available to the Eastern farmers, and only a few of the flour-mill and oil-mill feeds; nor other hay crops than alfalfa and grain hay. It is an easy matter, therefore, to become familiar with the feeds that are available for cattle feeding, and it is the duty one owes both to oneself and our country to adopt a system of feeding that will produce the best results at as low a feed cost as possible.

Ordinarily in dairy sections hay is fed to cows without the addition of grains or concentrates of any kind. While direct experiments with dairy

cows have shown that the production of the cows can be increased at least 12 to 15 per cent through the addition of grain to the hay ration, it is doubtful whether this increase will mean a direct net gain except in the case of high-producing cows. Grain feeding will not be likely to pay under war conditions with dairy cows of the ordinary run that do not produce over a couple of gallons of milk a day at their best, or only slightly above one-half pound of butter fat per day, and the corrals are full of them. It is, in fact, evident that smaller amounts of concentrates and only of the cheaper kinds ought to be fed to dairy herds, as to farm stock in general, at the present time than formerly, in the best interests of our country, and to save food that is needed to supply the wants of man at home and abroad. No one would advocate feeding good

dairy cows a smaller allowance of digestible nutrients per head daily, for they are entitled to all they get, but these may be supplied in other materials than has hitherto been the custom, such as have no value as human food or cannot be exported. The dairy cow is the most economical producer of human food among our farm animals; 100 pounds of digestible organic matter will produce, on the average, 18 to 20 pounds of milk solids, and 2½ pounds of edible solids in a beef steer, showing that it takes only about one-seventh as much feed to produce a pound of milk solids as of edible beef solids. The cow cannot be expected to, however, nor will she make such a production, unless fed a palatable ration and a liberal supply of nutrients in the ration.

In the choice of feeds, market conditions and the matter of feed equivalents should receive consideration. Roughly speaking, corn, wheat, barley, milo and wheat middlings have a similar value as feeds for dairy cows, and wheat bran, oats, dried beet pulp and cocoanut meal possess about a ten per cent lower feeding value, while linseed meal and cottonseed meal have about ten per cent higher value than the cereals. This being the case, why feed barley at \$3.60 a hundred, with wheat bran at less than \$2.00, or shorts or middlings but slightly higher than bran. Furthermore, by feeding other concentrates in place of barley, we release more of this for human consumption and help to keep down its price to that of other wheat substitutes.

Again, since hay has an approximate feeding value of one-half that of grain, why feed grain or concentrates at all, except to the best cows in the herd, when grain feeds sell at two and one-half to three times the price of hay. But it should be emphasized, as already suggested that, in war times as well as in peace, heavy-producing cows must be fed liberally and preferably a variety of feeds to reach their maximum production and to yield a maximum profit, and a portion of their feed must be in easily digestible, concentrated form in order to reach this end. Cows that do not come under this category may receive coarse roughage only, and under present conditions we may be justified in withholding concentrates to all but those yielding over a pound of butter fat a day. For such, a general rule of feeding at least a pound of grain feed per five pounds of milk produced may still be followed to advantage, but for others grain may be either excluded or largely reduced in the interest of economy of production.

Good milch cows fed hay only will not reach the production that they would on rations of roughage and grain feeds, and neither will it be advisable to feed such cows feeds of lower feeding value than hay, but dry cows and young stock may be fed a part of their roughage in the form of corn stover or milo stalks, or wheat, oat, barley, or rice straw, and similar materials of relatively low nutritive value that generally are abundant in grain sections or can be obtained at a low cost.

An experiment at the University Farm last fall illustrates the value of these feed materials. Two lots of animals, 18 calves and young heifers in one, and 12 dry cows in the other, were fed rations of alfalfa hay and barley straw, as much of both as they would clean up, during a period of 50 days. During a subsequent period of four weeks, milo stalks and alfalfa were fed, ad libitum. The young stock ate, on the average, 12 pounds of hay and about three pounds of straw a day per head, and the dry cows ate 15 pounds of hay and six pounds of straw, both lots making an average gain in body weight of 1.2 pounds a day for the whole period. The young animals did not eat enough straw with the hay to be of much importance, but the dry cows saved at least three pounds of hay per head daily, by being allowed what straw they would eat in addition to the hay. If the allowance of hay had been limited, the amount of straw eaten by either class of stock would of course have been materially increased.

In the second experiment, the young stock ate about 12 pounds of alfalfa hay per head daily and 8 pounds of milo stover, largely leaves and tender stalks, making an average daily gain of .6 pound per head during the feeding period, while the dry cows ate 13 pounds of alfalfa hay and 15 pounds of milo stalks—gaining on the average .5 pound per head a day during the feeding period.

It is possible, therefore, as has in fact been established long ago by European feeding experience, to save high-priced hay by feeding moderate amounts of materials of minor importance, like cereal straw and corn stover, stalks of grain sorghums and numerous now more or less neglected or despised waste products. Circular 167 of our college gives a somewhat full discussion of these potential feed materials and should prove interesting and profitable reading for any stockman in this time of scarcity of feed and high feed prices.

During the past few years silos have become common on the dairy

roughage, in nearly as large amounts as when grain feeds are fed. Outside of dairy sections in the extreme southern portion of the state where green feed is available practically the year around, silo building pays well and is a good patriotic move. There is no investment that a dairyman can make, except in good cows, which will yield larger returns and will enable him to produce more milk. Our dairy farmers are especially favored beyond their brethren to the north and east of us through the fact that they can grow two silage crops in a year on the same land and thus make both land and silos do double duty. The college of agriculture, through its extension division and farm advisers, stands ready to help intending silo builders. All you have to do is to let them know that assistance is wanted.

What has been said about silage applies, in some respects, to root crops as well, in sections where large yields of these can be produced per unit of land. In either case the necessity of grain feeding is largely done away with under present conditions, except as suggested, for high-producing cows.

During the last decade, the tendency of teachings relating to the feeding of farm animals has been away from fixed formulas and specific combinations of feeds, but it is helpful, in a general way, to offer some concrete examples of the best feeding practices under given conditions, and for this reason I give below a few sample dairy rations that are justified by the special conditions brought about by the war, and would recommend these to your careful consideration.

For cows producing less than ¾ pound of butter fat a day, or not over two gallons of milk per head: (1) 30 pounds alfalfa hay (or all they will eat); (2) 18 pounds alfalfa hay, 30 pounds silage (from Indian corn, milo, or sweet sorghum).

For cows producing over ¾ pound butter fat daily: (1) 25 pounds alfalfa hay, 1 pound of concentrates for every 5 pounds of milk produced. The following grain mixture is suggested: wheat bran, dried beet pulp, cocoanut meal, in the proportion of 2:1:1 by weight; (2) 12 pounds alfalfa hay, 25 pounds silage, the same grain mixture as above in a somewhat smaller proportion, say 1 to 6 pounds of milk.

Other grain mixtures that will prove economical at present prices are:

Wheat bran and dried beet pulp, equal parts by weight.

Wheat bran, cocoanut meal, 3:1 by weight.

Wheat bran, shorts (or middlings),

Scene in a Corn State

In other words this is California, for California is becoming one of the corn states. It is going to take some years to convince the world of it, but it seems as if the above photo helps the work along. This photo was taken not far from Stockton. Lots of the good yellow corn is now being made into the finest human food.

and stock ranches in many sections of the state, and according to all appearances, we are at the beginning of a great era of silo building in this state. This is in the line of economy, for the silo enables the farmer to preserve field crops for stock feeding at a minimum cost and a maximum nutritive effect. Silage is preeminently a dairy feed. The universal experience of dairy farmers goes to show that it increases the milk flow over and above that reached by giving corresponding amounts of dry feed materials. When a man has a silo, he grows crops to fill it with, and secures an ideal feed from the standpoint of palatability, nutritive effect and convenience of handling, that will enable him to produce milk as cheaply as possible, and when fed with good dry

ground mild (or rolled barley) and cocoanut meal, equal parts by weight.

If grain hay is fed to cows and not alfalfa, either of the above grain mixtures will be improved by adding about a pound of cottonseed meal or linseed meal, since it is necessary in this case to supplement the low protein roughage with a grain mixture containing some high protein concentrates; linseed meal is too expensive to be fed to dairy cows in any but small amounts, but cottonseed meal furnishes more protein for the money and with either of the mixtures given, makes a palatable and effective grain feed. If it cannot be obtained, wheat bran and cocoanut meal mixed in the proportion of 2 or 3:1 by weight, will make a satisfactory supplement when grain hay is fed.

## Moline Haying Machinery Saves Time and Improves the Quality

WITH Moline Haying Machinery you can put your crop up in less time and with less labor than by any other method, and at the same time you will get a better quality of hay.

After your grass is cut rake it into loose, fluffy windrows with a Moline Cylinder Side Delivery Rake and Tedder. In this manner it will cure rapidly, retain its natural green color and nutritive value because it is not exposed to the direct rays of the sun in curing. In case you desire to ted the hay before putting it up you can do so by simply shifting a lever on the Moline Cylinder Side Delivery Rake and Tedder which reverses action of the cylinder.

Then straddle the windrow with a Moline Hay Loader attached to your wagon and

roll on a load in the shortest possible time, avoiding the back breaking work of hand pitching. If you desire you can load just as well from the swath with a Moline Hay Loader.

Moline Hay Loaders are built in two types, gearless and cylinder. Either one of these will take care of your work.

In addition to hay loaders and side delivery rakes, we build a complete line of haying machinery including mowers, sulky rakes, sweep rakes, swinging rakes and overshot hay stackers.

The Moline Line of Harvesting and Haying Machinery is complete in every respect and no matter what your requirements may be we can supply you. Write for booklet entitled "The Moline Way of Making Hay" and name of your nearest Moline dealer. Address Department 49

## The Small Farm

THE Cultivator has tried to preach the truth in the gospel of the small farm for the man or the family with limited capital. Intensive farming, which means intensive experience and intensive work, may in large part make up for the lack of capital. The peasant gardeners of France, likewise those around the markets of London, and even the Chinese gardener who is tilling the lands which his forefathers began tilling more than 4000 years ago, all are proof that once we are driven to it the human being can make a small plot of land return wonderfully.

But this truth has been used as the foundation for an amazing mass of misinformation. Many city people, or so-called "back-to-the-landers," have an idea that success is easily secured if one confines his energies to an exceedingly small parcel of land. Many of these people have learned at serious cost that intensive farming means intensive experience, but still the writers with little personal experience of farming, but with sufficient control of the English language to make a most attractive story from their imaginations, are causing much loss and suffering.

A subscriber of the Cultivator, in one of the rich valleys near the Colorado, questions the relative merits of intensive and extensive farming: She writes:

May I suggest the question which I submit, as suitable matter for a leading article at some time in the near future. It seems to be one of general interest, especially in California, and especially important to prospective purchasers of farms, or those newly acquiring land.

Being ourselves novices at ranching, and the owners of something over 300 acres, only a small portion of which is, as yet, brought under cultivation, my husband and I are being told upon all sides that 40, or at the most 80, acres are all that a man can own to advantage; that ranches of this size pay better than bigger ones; that all the larger ranches are losing money.

The people who made this state-

ment are all, I believe, owners of 40 and 80 acre tracts — these being the greater number of land owners in this district. No opportunity to talk with larger landowners has presented itself thus far. I believe they are, for the most part, absentee owners.

It does not seem to us to stand to reason that there is more money to be made out of 80 acres—let us say—than out of 160, but being novices at ranching we do not like to seem opinionated in opposing the usual view.

Would it not be reasonable to believe that the question is chiefly one of the funds available for bringing the land held under cultivation?

If a man has homesteaded 160 acres and has no capital, he would, of course, do much better by selling 80 or even 120 acres of his land to get money for putting the amount he retains in perfect shape than if he tried to struggle along with poorly improved, or a good deal of unimproved land.

But if a man has both a homestead and a desert claim—320 acres—(and a certain amount of capital besides, perhaps—which is our personal case) if he disposes of so much of his land as to give them money enough to put the remaining part in good shape, will he not be safe in retaining say 160—or possibly 180 acres?

I cannot make it seem even simply good arithmetic that the man who owns 40 acres in perfect condition will get more net income than the man who owns 160 acres in equally good condition. Yet this is what we constantly hear. And if we suggest the possibility of counter arguments we are treated as inexperienced folk who will have to learn their lesson by hard knocks, and the "big ranches which don't pay"—are pointed out to us—though one wonders why if they do not pay, their owners continue to hold on to them. We are prepared to admit that proportionately 40 acres many yield larger returns than 160—other things being equal.

As this 40 acre conviction seems to be a very prevalent one I am sure that an article from some authoritative source would be of wide interest.

## Everybody is Responsible

Secretary McAdoo sends the following message: To the rural residents of America it is a matter of supreme national importance that the treasury of the United States shall be supplied at all times with the amount of money needed to furnish the food, the clothing, the guns, the ammunition, required by our soldiers to fight successfully for the safety and liberty of America, and to pay the allowances made by the government to the dependent wives and children of these soldiers and to pay the life insurance which the government permits every soldier to buy from it. The treasury must also have the necessary money to extend credit to the valiant Britons, French, Belgians and Italians, who are fighting alongside American soldiers on the bloody battlefields of France, Belgium and Italy.

Those who can only buy thrift stamps should buy thrift stamps, those who can buy only war savings stamps should buy war saving stamps, those who can buy liberty bonds should buy liberty bonds. Always they should buy as many stamps and as many bonds as they can instead of as few. The government has

now put these loans in such convenient form that there is no citizen in the land who cannot help to some extent if he is patriotic enough to do so.

The farmers of the nation traditionally are freedom loving people. One hundred and forty-three years ago on the nineteenth of this month, the farmers at Lexington and Concord fired the first shot for liberty, and it was heard around the world. I know that the American farmers of today are just as liberty loving as their heroic ancestors. I know that they will join with other Americans of every business and profession in providing the money which will enable their government to fight to a victorious conclusion this great war for liberty, justice and America's sacred rights.

—LIBERTY BOND—  
**COUNTY IN TEXAS PLEDGES ITSELF TO USE NO WHEAT FLOUR**

The people of Grimes County, Texas, have pledged themselves to use no wheat flour until after harvest. They have already turned over to the government one car of wheat flour and will deliver others in transit. These are being diverted to an Atlantic port for immediate shipment to the Allies.

## Caution Regarding Squirrel Poison

Commissioner Hecke writes:

"During the squirrel eradication campaign in Lake County, one of the questions most frequently asked was: 'Will poisoned barley injure cattle, hogs and sheep?' Poisoned barley will not injure cattle if scattered according to directions instead of placing it in little piles near the mouth of the burrows. The same applies to hogs, although somewhat more care should be taken than with cattle. It is known that hogs in very poor con-

dition if eating several of the poisoned squirrels will be affected. If the hog is in good condition or fat, the danger is greatly minimized. With sheep you must be careful, as sheep will pick up poisoned barley as easily as the squirrels will. For this reason in sheep pastures when poisoned barley is distributed, care should be taken to place poisoned barley within the burrow and, if possible, always stuff up the hole with old newspapers."

## Seed Inspection Under the Horticultural Law

Does the county horticultural commissioner's law provide for seed inspection? The answer is in the affirmative.—Section 2322f compels the holding of all shipments of plants or plant products or orchard appliances or seeds for inspection "which the county horticultural commissioners or the state commissioner of horticulture may consider liable to be infested or infected with dangerous insect pests, plant diseases or noxious weeds."

The law leaves it optional with the commissioner whether he shall inspect seeds or not. In general the state office has urged the inspection on field seeds such as alfalfa, oats, barley, clover and others as there is great danger of spreading Johnson grass, dodder, morning glory, yellow star thistle, etc., with these seeds. We do not recommend the inspection of garden and vegetable seed unless

there is reason to doubt their purity. The machinery for inspecting is at present too inaccurate to do this work with justice to all. We have also recommended that manifests be not required at least on small seed shipments because of this same lack of inspection.

The county law does not authorize the commissioners to judge the viability of seeds, or their quality in any way except in relation to pests. A great deal of educational work can be performed by the inspectors, and those who are buying seed may be informed as to its quality. The state needs a good seed law and the time is nearly ripe for such legislation. Uniformity should be our watchword and united action our password. Cooperation in all these matters will be the key to our future success in the horticultural quarantine work of the state.

## Egyptian Cotton History in United States

Written for California Cultivator By G. O. Thrailkill

**T**WO varieties of Egyptian cotton are now being grown in the United States, the Yuma and the Pima. From seed of the "Mit Afia" variety, imported in 1901, these new varieties have been developed at the government experiment stations in Arizona.

The Yuma variety was established and quite uniform in type by 1907, but not until 1912 was it recommended for commercial production; that year's crop of 375 bales was grown on about 480 acres. From the 3800 acres planted in 1913 there were 2135 bales picked. Late planting prevented some fields from fully maturing.

The profits from this crop caused quite a sensation and everyone planted as much cotton as he could in 1914. Much of the 1914 acreage was planted late on poor soil which had been hastily prepared and by men who knew little about cotton culture or the requirements of the cotton plant. Also most planters were not properly financed. The natural result was a low average yield, and only 6187 bales were picked from the 12,000 acres planted. Many farmers, however, who understood cotton and gave it proper care produced over a bale to the acre, and a few nearly a bale and a half.

When the war caused the price for cotton to drop to 50 per cent of what was expected it caused many failures among those who were insufficiently financed, but there were no conspicuous failures among those who had raised good crops and some even made a profit.

It is interesting to note that even

with the low prices prevailing during the planting season of 1915 there were 3700 acres put in, as compared to 3800 in 1913, which indicates that those familiar with cotton growing and marketing had confidence in the future success of this crop.

That this confidence was warranted is proved by the profits of this and the 1916 crop and the rapid increase in the cotton acreage. There were about 35,000 acres of Egyptian cotton grown in 1917, and it is estimated that this year over 100,000 acres will be devoted to Egyptian cotton.

Pima

In 1910 a superior plant was selected from a field of Yuma cotton grown at Sacaton, Arizona, and from the seed of this plant the government experts have developed the Pima variety. This variety produces better, has fewer vegetative branches, stronger fruiting branches, and has a finer quality and longer staple than the Yuma variety. The Pima with a staple of 1½ to 1¾ inches is equal to the Sakalleredes variety, which is the best cotton grown in Egypt.

The Yuma staple of 17-16 inches to 19-16 inches is equal to the average Egyptian cotton imported from Egypt. The Pima seed secured from the first commercial crop of 275 acres grown near Tempe, Arizona, in 1916 was planted under government supervision on 5000 acres in 1917. Owing to the strong demand for Pima seed this year the supply has been allotted to the different cotton growing areas of the Southwest. Many were late in reserving seed for this year's planting, but there will be an ample supply next year and it is quite probable the entire 1919 planting will be of the Pima variety.

### EXTRA TESTED

#### Your Guide To True Tire Service

On every road you see Racine Country Road and Multi-Mile Cord tires. Always they're doing their bit—users satisfied and happy.

These tires are Extra Tested in Racine Rubber Company factories. Because they are Extra Tested, you can expect extra wear—better service than from other tires.

## RACINE Country Road and Multi-Mile Cord TIRES

Extra Tested is more than a phrase. Much more. It reflects the extra care in the factory that results in extra wear on the road.

Take the Extra Test for rubber fitness, for example: rubber is blended and re-blended until the supreme degree of toughness is obtained. Out on the road you can see the extra mileage this Extra Test gives.

**Racine Country Road Tires**—scientifically built and Extra Tested for hard daily service over country roads. 5000 Mile Guarantee.

**Racine Multi-Mile Cord Tires**—cord quality proved in actual use, and bonded by the many Extra Tests.

Also red and gray inner tubes—Extra Tested.

It will pay you to know the dealer who sells them.

For Your Own Protection Be Certain Every Racine Tire You Buy Bears The Name

**RACINE RUBBER COMPANY**  
Racine, Wis.

## MACHINERY

## FOR SALE—WHY BUY NEW?

SAVE YOU HALF  
MATERIAL GUARANTEED  
USED PLOWS, CULTIVATORS, DRILLS — Extension disc cultivator, \$29.50; single disc riding plow, \$47.50; 14-in. Gilpin Deere riding plow, \$37.50; 4-gang Stockton, fine shape, \$27.50; spike harrows, \$16; sundries, cheapest in town. REET DRILLS—Ready to ship, \$39 up. WINDMILLS, MORE FOR LESS—16-ft. mills for irrigating, \$95; 8, 10-ft. mills. Now is time to get what you want, when we have complete stock ranch tools. HOW'S THIS? 30,000 gal. Redwood tank, lug hoops, \$135; 1100 gal. redwood, \$19; 1500 gal. \$22; heavy steel galv. barrels, \$6.75; galv. drums, \$4; 30 gal. hot water boilers, \$3.50; 50 gal. corrugated tank, \$19.50; 8000 gal. heavy corrugated galv. tank, \$135; 10,000 gal. heavy corrugated galv. tank, \$175; 900 gal. heavy riveted steel tank, \$68; 5 wagon tanks, \$28 to \$48; new, used redwood and galv. tanks all sizes.

COMPLETE PUMP OUTFIT; 3-in. Krogh vertical pump, shaft, 8 hp. engine belt, on cars, \$350.

COMPLETE PUMPING PLANT—Fine job only used two years. 8 hp. engine, 20-stroke Buckeye pump. Jack, hardwood rods, 7-in. brass cylinder, 100-ft. 8-in. casing, \$450. Office DEMMITT CO., 120 N. Main, upstairs. Yards, 816 Yale. Los Angeles.

## STOP THAT SLIP

It costs you money every hour you run the Pumping Plant. "MASTER-GRIP" PULLEY COVERING PERMANENTLY STOPS AND PREVENTS any belt slippage. Quickly applied to any pulley in a few minutes. Only 80c per square foot by Parcel Post. Tell us the size of your pulleys. SEND FOR INFORMATION AND SAMPLE.

FIDELITY SUPPLY CO.,  
Manufacturers.  
Phone, Broadway 3150.  
1207 Marsh-Strong Bldg., Los Angeles

For Sale—One 18 h. p. "Olds" distillate engine, mounted on wagon. One 50 h. p. "Olds" distillate engine; one 20 h. p. "Muncie" oil engine; one water well drilling rig; one wooden wagon running gear. The above used machinery may be priced at our shop. Will be sold at a very low figure. Dunn Manufacturing Co., Oxnard, Cal.

REMANUFACTURED PIPE  
All sizes, standard pipe, and wrought iron screw casing. All kinds of fittings. Guaranteed good as new. Write for prices.

WEISSBAUM PIPE WORKS.  
169 Eleventh St., San Francisco.

For Sale or Exchange—One 30-60 Hart-Parr tractor; one 6-14 in. bottom tractor plow, good repair, price \$1650. Consider horses, mules, lots or acreage. See machinery at BRILES, 216 N. Los Angeles Street, Los Angeles, or address Box 125, Upland, California.

For Sale—Holt "18" Caterpillar tractor. Has just been entirely REBUILT by Holt service men; all wearing parts renewed. It will stand closest mechanical inspection. Phone or write G. F. Blackwood, Glendora, California.

Gasoline Engines, the largest stock of used gas engines in California from 2 h. p. to 100. Thoroughly overhauled. Machinery Exchange, 733 North Spring St., Los Angeles.

For Sale—No. 5 Columbia well drilling rig capable of going down 400 feet. Traction part broken. All tools but mud scow. Cheap for cash or will trade for land. M. C. Egan, Lindsay, California.

For Sale—One Byron Jackson vertical Centrifugal Pump No. 4. Newly babitted, shaft, frame and pulley, complete. A bargain. Box 306, Colton, California.

For Sale—Almost new Ford tractor attachment. 135 So. Los Angeles St., Los Angeles.

For Sale—New Beeman Garden tractor. Am leaving. A bargain. John Cokerly, Lankershim, California.

## CATTLE

Guernseys—We will sell stock from our prize winning, high producing herd, at reasonable prices, valued according to individuality and breeding. Our supply is limited but if the buyer wants a number of animals and will write us we will furnish him with particulars. Revada Guernsey Farm, Yountville, Napa Co., Cal.

SHORTHORN CATTLE, SHROPSHIRE SHEEP, Berkshire Hogs and Shetland Ponies. Get our prices and descriptions before buying. Butte City Ranch, Box 1, Butte City, Glenn Co., Cal. W. P. Dwyer and W. S. Guilford, Owners.

Pedigreed Bull Calves. Registered \$50.00, unregistered \$25.00. Service bulls \$75 and up. Good individuals from producers. Cows with yearly records at a profit, tuberculin tested. Write or come and select. Horses. N. H. Locke Co., Lockeford, Cal.

Registered Holstein Bulls from high producing dams for sale at reasonable prices. Also a few choice females. McAllister Sons, Chino, Cal.

Venadera Jerseys, the herd with official yearly records. Calves of both sexes for sale. Guy H. Miller, Route 1, Modesto, Cal.

Ayrshires (registered) — A few young bulls, heifers and cows in milk at a bargain for quick sale. A. MacMinn, Phoenix, Ariz.

Sunshine Farm Jerseys—Bulls from officially tested dams for sale. E. E. Greenough, Merced.

For Sale—One registered Guernsey bull four years old. Abram Marron, Jr., Box 10, Oceanside.

Registered Holstein Bulls of various ages for sale. Millbrae Dairy, Millbrae, Cal.

Registered Jerseys—1 yearling bull for sale. J. R. Carhart, Fullerton, Cal.

## GOATS

Toggenburg Milch Goats — Rae P. Williams, Federal Realty Building, Oakland, Cal.

## AGRICULTURAL IMPLEMENTS

IMPLEMENTS AND RANCH SUPPLIES. Samples and slightly used. Four floors. Large stock. Liberal credit. Save 50 per cent on some. No branches. ARNOTT & COMPANY, INC., The Yellow Front. Established 1892 112-118 S. Los Angeles St., Los Angeles. For Sale—We have several slightly used two row corn planters. Greatly reduced price. Write quick for price and circular. ARNOTT & CO., 112 S. Los Angeles St., Los Angeles.

## AUTOMOBILE ACCESSORIES

Fords can burn half coal oil, all distillate, or cheapest gasoline, using our 1918 Carburetor; 34 miles per gallon guaranteed. Easy starting. Great power increase. Attach it yourself. Big profit selling for us. 30 days trial. Money back guarantee. Styles to fit any automobile. Air-Friction Carburetor Company, 313 Madison Street, Dayton, Ohio.

## GEESSE

Mammoth Geese—I am booking orders for eggs from my mammoth geese at 25c each. Ship any time. Order all you want. PEA FOWLS—Still have a few pair of young pea fowls at \$10 per pair. Order now, they won't last long. Chas. McNeely, Alpaugh, Cal.

## TURKEYS

Giant Bronze Turkey Eggs from America's leading strains. M. M. Reiman, Planada, Cal.

## ENGINES

Several New and Slightly Used Engines. ARNOTT & CO., Implements, 112 S. Los Angeles St., Los Angeles.

For Sale—One 15-30 Gas Pull Rumley engine, cost \$2000.00, will take \$1500.00. Abram Marron, Jr., Box 10, Oceanside.

## CHOLERA INFECTION CARRIERS

Pigeons, sparrows, crows and buzzards are active hog cholera infection carriers, according to the University of Missouri college of agriculture. Crows and buzzards are especially dangerous because of their habit of feeding upon the carcasses of dead hogs. By smearing their bodies with the blood or tissue juices, they carry this infectious material to healthy hogs and set up a new outbreak of cholera. The only effective method by which crows and buzzards can be kept away from the premises is by avoiding those things which attract them to the place. Carcasses or other food material should not be left exposed to them.

The dog likewise is an infection carrier. Since by nature he is a meat eating animal, he feeds upon the carcasses of dead hogs and when his immediate appetite is satisfied, he almost invariably gathers up pieces of the diseased meat and carries them to his home. It is of utmost importance therefore if cholera is in the immediate neighborhood to confine the dog and undertake to prevent strange dogs from trespassing on the farm.

Human beings are carriers of infection. The person who understands the possibility of infections on his shoes and clothing will refrain from visiting the hog lots of his neighbors where there are or have been sick hogs. He will also see that persons visiting his farm for any purpose whatsoever stay out of his hog sheds and pens when there is any hog cholera in the community. In exchanging labor with neighbors or in transferring farm implements, farmers sometimes unwittingly carry infections home to their hogs.

## —LIBERTY BOND—

## MONEY IN EWES

"Purchased 65 Merino ewes fall of 1916 and bred them to one of my Dorset rams. In March, 1917, the 65 ewes dropped 70 lambs and raised all of them. In November I sold them at 16 cents per pound and they averaged 87 pounds and brought \$974.40. Sold the wool from the 65 Merino ewes for \$375, making a total of \$1,349.40 from the sale of 70 lambs and 500 pounds wool."—Dorset Bulletin.

## —LIBERTY BOND—

The man who grows more food adds to the wealth of the world; the man who grows dollars may be adding only to his own wealth.

## NATIONAL MILK AND DAIRY FARM EXPOSITION

New York will be the Mecca for thousands of dairymen and others directly interested in the milk industry who will come from all parts of the country to attend the National Milk and Dairy Farm Exposition which is to be held in Grand Central Palace the week of May 20. Interest in the affair is running high for the exposition will serve to show all that is new and interesting in the industry and its allied interests in a most comprehensive way.

Three floors of the huge building will be devoted to the exposition, during which a series of important conferences will be held. There will be exhibits and practical demonstrations of all forms of milk foods and milk products, processes of milking, handling, machinery and equipment, and all manner of things relating to the dairy farm and its allied interests. One of the chief purposes will be to demonstrate the fact that milk is one of nature's valuable as well as one of the cheapest of foods.

## —LIBERTY BOND—

## INOCULATION OF ALFALFA

Inoculation for alfalfa may best be accomplished by scattering over the area to be seeded surface soil taken to the depth of four or five inches from another field upon which the crop has been previously successfully grown. The soil should be broadcasted, at the rate of from 250 to 500 pounds per acre, and harrowed in immediately. The spreading should take place on a cloudy day or late in the afternoon, as the sun's rays are destructive to the germs. Soil from the roots of sweet-clover plants also will inoculate alfalfa. Care should be taken to avoid introducing noxious weeds or fungous diseases.

## —LIBERTY BOND—

## MUTUALLY MISTAKEN

"As I was going over the bridge the other day," said an Irishman, "I met Patsy O'Brien. 'O'Brien, I says, 'how are you?' 'Pretty well, thank you, Brady!' says he. 'Brady?' says I, 'that's not my name.' 'Faith,' says he, 'and mine's not O'Brien!' With that we looked agin at each other, and sure enough it was nather of us!"—The Furrow.

## THE SHORTHORN MAGAZINE

The April number of "The Shorthorn in America," published by the American Shorthorn Breeders' Association, is now in the mails. It begins the third year of its publication and will be generally regarded as one of the most interesting and informing numbers yet issued.

## —LIBERTY BOND—

The federal government is asking very seriously of California as to its situation in the matter of live stock diseases, especially with reference to hog cholera and its prevalence. State Veterinarian Keane has been asked to canvass the situation and report as to number of animals infected, location of infection centers, and such other information as may be of value in the organizing of a campaign to control these diseases. In other words, the state must be cleaned up.

## T. E. Berry

918 So. Main Street  
Los Angeles, Cal.

**Can Furnish You with  
Used Gasoline Engines  
for Cream Separators  
Wood Saws, Pumps**

**GARDEN TRACTORS  
and all other RANCH  
APPLIANCES where  
Motor Power can be  
Used.**

These motors range from one cylinder 1½ horse power to four cylinders 18 horse power. Space will not permit details—enough to say they are practical for all ranch purposes, and range in price from \$15.00 to \$100.00. A post card will bring full information. I will guarantee each motor to give satisfaction for its purpose or no shipment will be made. Let T. E. Berry solve your small engine wants.

## Bad Bugs of the Hen Yard

Written for California Cultivator By Jean A. Koethen

HERE are no good bugs in the hen yard. They are all bad, hopelessly bad. Not only are they all bad and always bad, but they are at their worst when everything is at its best, in the spring when hens are laying for all they are worth, when young stock is pushing forward for all the world like the potatoes and cabbage plants and fruit buds. When the perfect June days come with their wonderful flood of life, then, along with that flood come the pests of the hen yard, the vampire mites that suck and hide and cling and wallow in the blood of their victims. Lice were there before them, but lice are always with us unless we get rid of them. Ticks, once in are in for keeps. Sticktight fleas, like mites, come with the warmer weather. There you have them, the whole pestiferous crew, mites, lice, ticks, fleas, but worst of all are the mites.

He has a lovely Latin name, the common red mite that makes us so much trouble. Dermanyssus Gallinae, scientists call him. This mite is about half a millimeter long. The female is a little larger than the male. Both are gray when they are empty. When they are gorged from a night's feeding they are a dark red. They visit the fowls only to feed and spend the rest of the time on the under sides of the roosts, in cracks and crevices, under collections of droppings or other filth, and in the nest material. Here they breed, and in spring and summer they reproduce with astonishing rapidity.

One of the reasons for early hatching in California is the great care which must be employed to keep red mites from the coops and brooders of the young chicks after April. Mites may be found at any season in houses that are not sprayed, but if coops and brooders are carefully cleaned and disinfected when the chicks are put in them, and are at a reasonable distance from the houses of the older stock, mites seldom find them before the usual April hot spell. After this time they must be watched constantly.

One of the best disinfectants for keeping mites away from the poultry house is cresol. This may be bought in any quantity in the form of commercial cresol and is diluted with water in proportion varying from two to five per cent cresol with 50 to 20 per cent water. It is generally used as a spray but may be applied with a brush. In using this or any other liquid disinfectant, remember that mites live in the cracks in the wood and that every inch of the walls should be soaked. If even a few are left for breeders the work will have to be done over again. If there are many cracks mites may easily be driven through the wall, hence it is wise to spray both inside and out.

Another disinfectant that is as efficient in many cases as cresol is a mixture of crude carbolic acid and kerosene (one part acid to four or five of kerosene.) If the acid is full strength this is just as good as the cresol solution, but it is not dependable. On this account cresol is preferred at Berkeley and other poultry experiment stations.

All houses should be sprayed once or twice a month whether there is evidence of the presence of mites or not. Once you know the mites are

there only a thorough housecleaning and most frequent spraying will exterminate them. Their presence may often be detected by little white flaky looking scales on and under the roofs. These look as if they might come from the fowls, but they do not. They are the cast-off skins of young mites which molt several times before they attain adult size. When you see these cast skins, you may know that mites are present and are breeding.

The louse problem is considerably simpler than the mite problem. It may usually be taken for granted that lice are on the bodies of the fowls unless they have been powdered or greased occasionally. Mediterraneanans are an apparent exception to this rule. Some Leghorn breeders dust their birds once or twice a year; others declare that they do not find it necessary. Whether this is because Mediterranean feathers are closer than those of the larger breeds or because of their greater activity I do not know, but the fact seems to be that fowls are infested with vermin in exact proportion to their size. A dust bath in moist dirt helps some and is a great comfort to the birds, but it does not rid Orpingtons or Brahmas of their unwelcome guests. Such a riddance can only be effected by dusting with a powder that poisons or smothers the lice, or both, or by greasing with lard or some specially prepared ointment. What is known as "blue" ointment is recommended by many experts. This is mixed with an equal quantity of vaseline, and a very small amount rubbed about the vent, where lice always breed. As this ointment might poison the bird if it succeeded in reaching it with its bill, most poultry keepers prefer a dry powder. There are a number of excellent proprietary powders on the market, of which those which contain most tobacco seem most efficacious. For a large flock the Lowry powder can be prepared at home. Take three parts gasoline and one part crude carbolic acid or cresol, mix and add gradually, stirring constantly, enough plaster of Paris to take up all the moisture. This makes a pinkish and rather lumpy powder which should be put through a sieve before it is used. For young chicks Persian insect or buhach powder is safer than the stronger preparations used for adult fowls. In warm weather the heads of the chicks may be greased. In chilly weather it is better to keep the hen thoroughly dusted and let the chicks alone. If she is perfectly clean they will not be lousy. Chicks in brooders should not need dusting for a month. After they reach this age an occasional dusting at night over their backs with Persian insect powder is safe and not much trouble.

It is hard to say just how seriously the presence of lice on hens affects egg production. Certainly they are very annoying, and it is hardly fair to expect hens to do their best when they must scratch night and day just to keep themselves comfortable. With chicks, however, they are a great menace to life and health. No chick can grow as it should when it is teased and tickled by lice. If it lives it will be a runt, and it is most likely not to live. When chicks a month old or more begin to stand around looking droopy and miserable, with rough feathers and humpy backs, the trouble may be laid with almost absolute

## WITTE IRRIGATING ENGINES

### Kerosene - Distillate

2 to 22 H. P.

Pump your water with a WITTE. All you need is a centrifugal and my Special Model Kerosene-Distillate Engine. I can lay your engine down at least cost. Save the middleman's profit—Get your engine NOW, while prices are still low. Have reliable power for all your work. Made in standard sizes—2, 3, 4, 6, 8, 12, 16 and 22 H. P. Battery or magneto equipment. I am in a position to offer you the best prices and make immediate shipment. 30-Day Trial — 5-Year Signed Guarantee. Largest exclusive engine factory in the world selling direct to user. Cash, Payments, Bank Deposit or No Money Down. Suit yourself as to terms. Don't make a deal until you have investigated my offer. — Ed. H. Witte, President.

### WITTE ENGINE WORKS

3101 Oakland Ave., Kansas City, Mo.  
3101 Empire Bldg., Pittsburgh, Pa.

Correspondence with the advertisers in the California Cultivator will convince you that their articles will save you money.

certainly to either lice or mites. First give them all a thorough dusting over the back, about the vent, on head and under wings, then go for the coops. When chicks have commenced to show the effects of louse or mite infestation it may be too late to save their lives, but the chicks that are still well have a chance of escape. In warm weather coops in which mites have once been found should be washed every day with the hose and sprayed or painted with disinfectant twice a week.

There seems to be no treatment that is certain death to the tick, the

bedbug of the poultry house. Fortunately these pests are rarely found except in old and long-neglected houses. When they are once in, the only cure seems to be to burn the house.

Stick-tight fleas belong to very sandy soils. They are tiny black creatures which burrow into the combs and wattles of the birds and remain there until they are killed. The simplest method of killing them is by anointing with vaseline, which smothers the fleas. If a bird is badly infested, two or three applications of vaseline may be required.

## The Egg Situation

Do Not Kill the Hen That Lays the Golden Egg

All present indications point to continued high prices for eggs, with the possibility of newly laid eggs of prime quality selling next winter at prices considerably above those of last winter. Eggs are going into storage now at costs which necessitate a retail price of 40 cents or better next fall and winter in order to return a reasonable profit for handling and storing.

Whether the present shortage of eggs continues through next winter or not depends on what the farmers in U. S. do with their poultry during the next six or eight weeks. If they follow out their expressed intention of selling the greater part of the farm flock because of the high cost of feed, and the fowls which are sold are not replaced with pullets, fresh eggs will be as scarce next November and December as the proverbial "hen's teeth."

Because of the existing shortage in the egg market and the increasing demand for eggs due to the advancing cost of other livestock products, every farmer in the state should plan to raise as many good pullets this season as he has facilities to handle. They should be carefully fed so that they will be well grown and begin to lay before the first of November. For a profitable yield of eggs during the winter months, early hatched pullets are much more valuable than hens.

The older hens may be sent to market a few at a time as fast as they stop laying. All hens which remain in laying condition through the summer should be retained until fall. Those which continue egg production until October 1 or later should be retained for use as breeders. If properly handled, hens may be carried through the summer at a good profit in spite of the high cost of feed. If these hens are thrown on the market now, the market will have an oversupply greater than the storage houses can handle and prices will be forced down to a low level.

Don't kill laying hens; raise as many pullets as possible; have all chickens hatched before June 1; feed well and handle carefully. If these suggestions are followed, a good profit will result, and an egg famine will be avoided.

### Preserving Eggs

An abundant supply of eggs during the months of high prices can be provided by the preservation of eggs in a solution of water glass. The following method is practical for the housewife who desires to preserve a case (30 dozen) of eggs for winter use:

Obtain three pints of water glass (sodium silicate) at a drug store and mix it with 27 pints of cool boiled water. Place fresh, clean eggs carefully in a ten gallon earthenware jar.

Be sure that none of the eggs are cracked, old or dirty.

After putting the eggs in the jar, place a large plate over them and pour in the water glass solution until the plate is submerged under two inches of liquid. If one desires to preserve the eggs from day to day, the solution may be put in the jar and the eggs placed therein as gathered until the jar is full. Tie heavy paper over the top of the jar and move it carefully to a cool place where it may remain until one is ready to use the eggs. Remove them from the solution as needed and wash with cold water. If one desires to boil them, prick one or two small holes in each egg with a needle. This will prevent the contents from breaking the shell.

—LIBERTY BOND—

### THE POULTRY BUSINESS

Speaking of war conditions, figures show that the business of poultry raising is profitable in spite of the high prices of feed. Professor W. E. Lloyd of the poultry department at the University Farm made the following statement in regard to the above:

"Feed is now very high in price, and the ration which formerly cost \$1.35 to feed a Leghorn hen for one year, exclusive of labor, now costs approximately \$2.50, or an 85 per cent advance, which might frighten the producer were it not for the advance in egg prices. It is very probable that

eggs will average not less than 36 cents per dozen this year, and if this be the case it will take but seven dozen eggs to pay the hen's feed bill. If we add an additional two dozen to pay for labor costs it will take only nine dozen eggs to pay the hen's entire expenses, exclusive of depreciation and interest on investment. While that does not show a large return, it is at least holding our own while the war lasts, which is in itself quite an achievement, and any flock of fowls which cannot show an average of nine dozen eggs per hen per year should have been eliminated long before the war came along."—W. J.

—LIBERTY BOND—

### THE RELATIVE VALUE OF DIFFERENT VARIETIES OF COTTON SEED FOR OIL PRODUCTION

We call our readers' attention to the facts relative to the different varieties of cotton seed and the oil contents, as given by Prof. L. E. Rast, of the Georgia agricultural college. Prof. Rast has been working for several years on the problem of determining the relative oil contents of different staple varieties of cotton seed. It will be a surprise to our readers to learn that in a ton of seed there is a wide difference of 16½ gallons of oil, between the highest and the lowest, and that this 16½ gallons of oil at the present price of oil, \$1.31½ cents per gallon, makes the great difference of \$21.66 in the value of a ton of seed. Hence the farmer who grows the highest, lacks \$10 per ton of getting the value of his seed, while the one who grows the lowest is getting \$10 per ton too much for his seed, because the oil mills must pay on the average yield of oil per ton of seed.—Southern Cultivator.

—LIBERTY BOND—

The forest service furnishes protection from fire to hundreds of thousands of acres within or near the national forests, belonging to private individuals and organizations. During 1917 fire protection was furnished approximately 275 owners of private lands by the forest service in California. This protection is not given gratis, since the forest service has no authority to fight fire on privately owned lands, except where failure to do so would seriously threaten adjoin-

ing public property, but was furnished the land owners at a price based upon the cost to the government of protecting national forest lands of the same general character and condition of hazard.

Land owners cooperating with the government in fire protection are of all classes, ranging from the homesteader with a few acres to the owner of large tracts of timber, and municipalities or organizations owning large areas of valuable brush watershed. The sum paid the government by private owners of lands for this protection last year amounted to \$25,000 in round numbers. More than \$4,000 of this was from land owners for the first time cooperating with the forest service in fire protection.

## A CYCLONE SILO Will Save You Big Money On Your Feed Bill

If you are in the farming business to make money you must save as well as earn—a silo will save you its cost in the first year of its use. With a silo you can convert into first-class stock feed a lot of your product that you have wasted in the past—

### The CYCLONE SILO

—is constructed to stand up under the most trying conditions. Flat iron bands encircle the CYCLONE (as illustrated) in such a way that it cannot possibly twist or warp out of shape—does not get smaller at top than bottom after usage. No guy wires to stumble over.

We, who make this silo, have been manufacturing wood tanks, wood stave pipe, etc., for use in all parts of the world for 25 years—we know our business and our guarantee that this silo is right means something.

## Tractor Engine for Pumping

Will a tractor rated at 12 h. p. at belt be as good and economical to pump water as a stationary engine of same size? The tractor is new but has not been a success as an orchard machine and can be purchased at about the same price as a stationary engine.—Subscriber, Fresno.

This question was submitted to

Prof. J. B. Davidson of the University of California, who answers:

"The tractor engine used for stationary purposes ought to give satisfactory service and at the same time not interfere with the use of the tractor, thus extending its field of usefulness. The exceptions would be where an extremely high speed motor is used, where no adequate provision is made for controlling the speed and where the design is of such a character that the heavier fuels cannot be used. It is entirely proper and good

business to purchase a tractor with the thought of using it for stationary work."

—LIBERTY—

## Bean Buyer

A subscriber at Wilcox, Arizona writes as to name and address of bean broker. This is not a question of general interest to our subscribers, and as the subscriber fails to sign his name we are unable to forward the information.

—LIBERTY—

## Coarse Rind of Oranges

If the subscriber who complained of rough rind and coarse oranges would use a good commercial fertilizer around his trees, say one-half pound for each year of age to each tree, he would find the fruit much improved in appearance and flavor.

My lemon trees bore very rough and lumpy fruit. I was advised to rebud them and was told my trees were more in the nature of shade than of fruit trees. I purchased some good fertilizer and used it carefully. In less than a year there was a decided improvement. Trees loaded with "the finest lemons that were ever in the packing house," so the foreman of the house told me.—Orange County, Subscriber.

## Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115 1/2 N. Broadway, Los Angeles.

—LIBERTY—

## Broken Contract

A and B enter into a contract whereby B was to saw wood for A, and A sold three mules to B for which B paid \$50 on account and agreed to pay \$20 out of each carload of wood sawed. B shows up for work two weeks late at which time A cannot procure help sufficient to keep B busy; B cut one carload of wood and then took the mules and his saw away. Can B hold the mules and if not what is the way to proceed? —Subscriber, Lemon Cove.

The terms of the contract with respect to the passage of title to the mules is not stated. Unless a present sale and transfer of title and the date of the payment of the \$50 was made it would seem that A should be entitled to recover the mules through replevin action. It would also seem that A might have an action for damages against B for his gross breaches of the contract.

## We will Reward You With This Great Book

Everybody can have a copy under our liberal offer. Send for yours today.

### Greatest Book on Feeding.

"Feeds and Feeding", by Henry and Morrison, is the recognized standard authority on the feeding of dairy cows, beef cattle, calves, hogs, horses and sheep. The authors at great expense and with much time and labor, have compiled the most important findings of the investigators of both the Old World and the New in the science of animal nutrition, together with the vast number of feeding trials, conducted in California and the experiment stations of other states, the whole being rounded out by the practical experiments of many of the leading stockmen of America.

## How to Get Best Results Feeding California Barley

"Feeds and Feeding" is a large volume, 701 pages in substantial cloth binding, clearly printed in large type and written in plain, understandable language. It is intensely interesting throughout and represents the sum total of hundreds of experiments, trials, and record tests on practically every feeding combination ever attempted and the personal experiences of the authors and many other noted feeding experts from California to Maine.

Full and complete information is given in regard to the feeding and feed value of California barley, how to obtain the best results, and giving the results of many barley feeding tests. (Pages 162, 303, 309, 360, 414, 454, 525, 590.)

### Only takes a Little Time.

You can obtain one of these valuable books at no expense—just a few minutes' easy work. To any reader of California Cultivator who will secure for us only three new yearly subscriptions to California Cultivator at \$1.00 each—the regular subscription price, we will send a copy of the latest edition of "Feeds and Feeding" by Henry and Morrison. If you want to buy this book it will cost you \$2.25 anywhere. You know California Cultivator and how much valuable information you get from its columns each issue. You receive the best thought and experiences of many of the West's most authoritative writers, the results of many tests and experiments and the live stock, dairy and agricultural news of what is going on over the entire Pacific Coast at a cost of only \$1.00 per year. Your neighbor, if he is not already a subscriber, will be glad to have you show him a copy. You can get three new subscribers at \$1.00 each quickly and easily. Send us the \$3.00 and the subscribers' names and addresses and we will send the book to you postpaid. You may include your own subscription by paying a full year in advance of this date and including two new subscriptions at \$1.00 each. There must be at least two new subscriptions for one year.

## AUTOMOBILE TINKERITIS

A great many times, as records show, the first thing a new automobile owner begins to think about is whether or not the car, after having been run for a short time, needs something done to it, or in other words a little tinkering. If the malady known as "tinkeritis" were less common it might pass unnoticed, but unfortunately curiosity and uncertainty come in great big heaps even to well meaning ones. At least that is the determination of a tinker who writes for Successful Farming.

The plan and rule for all owners of machinery, from a watch up to an automobile, is to avoid tinkering with the thing unless absolutely necessary. You may be real sure you know what should be done; but it may be just as true on the other hand that you do not know. It is wonderful, but none the less reasonable for all that, how much damage the wrong kind of tinkering can do. One of the points of greatest interest for tinkers round an auto is the carburetor. A slight turn or two of adjustment nuts will quickly throw this apparatus out of adjustment. I have seen cases of men and boys spending whole hours at a time to see how they could make the motor perform by various adjustments of the carburetor when there was no necessity for it. The consequence in nearly every case was that some more experienced hand had to correct the mistakes of the tinkers. Then comes the regulator cut-out, that little device that cuts off battery from generator the instant the motor speed drops too low for charging the battery and so prevent the battery from discharging when the car comes to rest. The regulator cut-out is a delicate instrument at best, and all car owners who own electrically equipped cars should be absolutely sure it is left alone and touched only by persons who understand the nature of it. Usually, the factory has made the proper adjustment. In time undoubtedly, as heat from excessive speed charges the battery too much and too fast, there will be a fusion of the regulator contact points. In such an event be sure there is no tinkering done. Tinkering without actually correcting the defect will aggravate the trouble, but be sure the workman knows before he attempts it. A car came in one day with a discharged battery and I was asked to find out why the battery did not get any current from the generator. I found the regulator cut-out had been made a sort of experimental station for a number of workmen who had proved themselves mighty handy with pliers, as the marks showed. Result, there was nothing for me to do but tell the owner it was past repair and for him to buy a new one, but to be sure next time that it was not made the object of ignorant tinkering. Another fellow thought his battery needed a drink of something, but he did not stop to consider nor ask someone who really knew what should be done. He actually poured in some soda pop and later had to have a battery man take it all apart, clean it, rebuild and put in new solution. That bottle of soda really cost him \$12, but it is hoped he learned a lesson.

The habit does not seem to center itself so much on the larger mechanical parts as the smaller ones, and it is well that it does not. Once in a while you will find somebody who blames the valves and tries to get at them every time the motor misses fire. And so it goes.

The Cultivator Patterns

8738—Children's Coat. Cut in sizes 2, 4 and 6 years. The back and fronts of the coat are gathered at the neck and it is finished with a flat collar.

8522—Ladies' Slip on Blouse. Cut in sizes 36, 38, 40 and 42 inches bust measure. The blouse is to be slipped on over the head like a middy, and so it is made with deep opening at the neck.

8754—Ladies' One Piece Combination. Cut in sizes 36, 40 and 44 inches bust measure. The combination is all in one piece with perfectly straight sides and there is a sort of deep notch at each side which forms the openings for the knees.

8311—Ladies' Waist. Cut in sizes 34, 36, 38, 40 and 42 inches bust measure. The center front closing is stitched back to form a broad seam.

8730—Girls' Suspender Dress. Cut in sizes 8, 10, 12 and 14 years. This suspender dress has a side-plaited skirt and it is worn over a separate gimpie.

8486—Misses' or Small Women's Dress. Cut in sizes 16, 18 and 20 years. The dress closes from neck to hem at center back and the neck is finished with a round collar.

8269—Ladies' One Piece Gathered Skirt. Cut in sizes 24, 26, 28, 30 and 32 inches waist measure. This one piece skirt has a fancy belt arrangement and slash pockets at the sides.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

A PATRIOTIC PIG TALE

This little pig went to market,  
And traveled from store to store,  
Buying all the white sugar  
Till the grocers had no more.

This little pig stayed at home  
And wished that Hoover were dead;  
While he gorged himself on wheatless  
days  
With dainties and whole-wheat bread.

This little pig had none,  
But a glutton nevertheless;  
For he hoarded his gold from the U. S. A.  
While he grunted his wail of distress.

This little pig said "Wee, Wee, Wee  
Send some other boy to France;  
The Germans might aim their guns to-  
ward me,  
And I don't want to give them the  
chance."

Our food administrators  
Urge farmers to raise more swine;  
But God protect our country  
From more of the human kind.  
—Mrs. Laura Mellinger, in Farmer's  
Guide.

NOTHING TO WORRY ABOUT—  
TOO MUCH TO DO

**N**OT a person living today in any civilized land is beyond danger of starvation. A few years ago it was stated as a truism that modern agriculture had rendered famine impossible

a dozen kinds of red-hot ruin that may flow from this war.

Assuredly there is plenty to worry over.

And yet — veritably it is a human miracle!—nobody worries.

This is not because men are insensitive to the discomforts of their current situation or blind to dangers ahead. The truth is instead that the generality of men are more alive than ever to the seriousness of conditions that daily twist tighter the pinch of difficulty and hardship.

But facing all these things, and quite conscious of their sinister meaning, humanity braces itself with a serene courage and quietly vows to take what comes without whining—regardless of cost.

The simple platitude practical philosophers have preached for ages without visible effect—that worry beforehand neither postpones an apprehended evil nor makes it easier to bear when it does befall—has at last been taken into common calculations.

Your Bond May Bring Him Home Again

anywhere in Europe and America at least. Nobody is saying that now.

Likewise, through all the present winter only a small proportion of people have had reliable assurance of getting from week to week enough fuel to warm homes and cook food.

In fact, quite apart from the supply of food and fuel, comparatively few families can feel secure against such failure or insufficiency of income as may soon subject them to severe privations. Already most homes have surrendered many comforts.

Above all else, there hang over unnumbered millions of households portents that threaten the direst of sorrows whenever the big guns boom on the battle-front.

And with those whose minds dwell on the larger affairs of humanity—the world's politics, education, and religion—optimism can not possibly be strenuous enough to shut out of view

In the economical spirit of the times folks are honestly undertaking to eliminate the waste of attention and energy that worry diverts from work.

Accepting thus in advance the worst that can happen, folks find nothing that any longer looks unendurable. The habit grows on men of spending their imagination not in trying to picture how awful a disaster may be, but in framing to themselves a forecast of the alleviations and comforts which will enable them to bear it.

No man is going to worry much over what he is losing or about to lose (even though life itself is at stake) if his soul is centered on getting some great thing done—and he can see it almost accomplished.

Nobody is troubled over parting with his money if in exchange he is getting something that he wants more than dollars. Exactly so, any kind of

B REEDERS  
EST  
OOKS

Two men, prominent in two  
great world industries, dairying  
and swine breeding, have each  
written a book giving the best  
information they have from  
years of actual experience, from  
many hours of study and careful  
reading and from meeting hun-  
dreds of dairymen and breeders  
like themselves.

You Should Have  
Both Books

This book, entitled "Forty  
Years' Experience of a Practi-  
cal Hog Man," by A. J. Lovejoy,  
is a neatly bound book of 170  
pages that is what its name im-  
plies and more. It contains in-  
formation on all the general sub-  
jects relating to swine breeding  
and feeding and goes into care-  
ful analysis and minute detail of  
many related subjects.

Van Pelt's Cow  
Book

is another volume that thou-  
sands of dairymen have read  
and reread and studied because  
of the very thorough manner in  
which the essential knowledge  
of successful dairying is set  
forth. This book is profusely  
illustrated, printed on fine qual-  
ity of paper and will be a valu-  
able possession in the hands of  
any one who owns or handles  
cows.

Either book may be secured  
by sending \$1.25 which will pay  
for the book and one year's sub-  
scription to California Cultiva-  
tor.

Both books may be secured by  
sending \$2.50, which will pay for  
both and two years' subscrip-  
tion, new or renewal, to Califor-  
nia Cultivator.

Address all orders to Califor-  
nia Cultivator, 115-117 N. Broad-  
way, Los Angeles.

spiritual or material sacrifice counts naught to the typical human if something big, fine, and enduring is to be obtained thereby.

Sacrifice pains only when, either because men can not see clearly or because there really is no good to be gained, the sacrifice appears useless.

But in this crisis everybody sees that if the nation gives, endures, and suffers all that's asked of it, the gain will be a world made safe again for the just, the generous, the innocent, the weak.

For that sake true-hearted men and women bind themselves by their own will not to flinch or complain at any requirement or any consequence.

That is why sickness seems in a hospital less a curse. It is likewise a big reason why people today are putting up cheerfully with inconveniences they would have railed against in mighty wrath a year ago, accepting restrictions in food and fuel that would at any time heretofore have driven them to rebellion, and thinking with entire calmness of eventualities in want and woe that lately would have cast them into fits of terror.

To go hungry, to go shabby, to pay exhausting taxes, to send loved ones into mortal danger! — if the whole mass of the people have to stand it, then one would be ashamed to be the weakling that first whimpered. And where everybody is unwilling to be the first to show the white feather, there will be obviously no white feather shown.

Always there is the saving thought: "What others can bear I can bear, too." And while that thought ties men together, their combined strength

carries giant loads without breaking.

So God intended. He made the race to bear burdens in common, to sacrifice lesser things for greater, and to live above worry.

And may mankind not forget, when peace comes again, the lessons they are learning now! — The Continent, Chicago.

—LIBERTY BOND—

#### PARCEL POST TO OUR BOYS IN FRANCE

Because of the great mass of candies, cakes, goodies of all kinds, tobacco, toilet articles, etc., mailed to our soldiers in France from the United States deliveries have been delayed and the service seriously embarrassed, and because it is now found that these things can be bought in France as cheaply and in some cases more cheaply than they can in this country, the war department has ordered:

"In future shipments to any members of the American expeditionary forces abroad will be limited to those articles which have been requested by the individuals to whom same is to be shipped, such requests having been approved by his regimental or higher commander. Parcel post shipments will be accepted by the postoffice authorities, and other shipments by freight and express companies only upon presentation of the above approved request in each individual case."

This order went into effect April 15.

—LIBERTY BOND—

#### FARM HOME DEPARTMENT OF IMPERIAL FARM BUREAU

The farm home department of Imperial County's farm bureau, under the direction of Mrs. Della J. Morris, is very enthusiastic and is doing excellent work. At present it is conducting the following campaigns: can-

ning, gardening, poultry, wheat conservation, and liberty pig. At a meeting of the chairmen of the 13 farm home centers at El Centro on April 6 the following were elected officers of the farm home department: Chairman, Mrs. Stuart Swink, Mt. Signal; vice president, Mrs. Wm. Moores, Seeley; secretary, Mrs. Walter S. Wilkinson, Meloland.

—LIBERTY BOND—

#### BULLETINS OF INTEREST TO HOMEMAKERS

Two bulletins which will be of interest to every homemaker in the land may be had for the asking. Write Department of Publications, U. S. D. A., Washington, D. C., and ask for Bulletin 927, "Farm Home Conveniences," by Madge J. Reese. It is a 32 page illustrated bulletin which will give many a homemaker ideas as to how she can secure labor saving helps. At the same time ask for Bulletin 955, "Use of Wheat Flour Substitutes in Baking," by Hannah L. Wessling. There are dozens of recipes for various kinds of breads, dumplings, grid-dle cakes, cookies, and almost everything that can be made from wheat flour substitutes.

—LIBERTY BOND—

#### NOT FOR RASTUS

"Eph, I think I'll go to war."

"Very well, Rastus, but whut branch am yo' gwinter jin—de Army, Navy or de aviation corpse?"

"De aviation corpse—whut dat?"

"Oh, dat am de flyin' department."

"You mean one o' dem airypplanes?"

"Yaas."

"No, suh! Lookaheah, niggah, when I dies I doan wanta dig ma grave wid ma head."—Ex.

#### OBSERVE RAISIN DAY, APRIL 30

Some Good Things to Help Observe April 30 and 364 Days Thereafter

RAISIN Day will be observed this year as in the years past. Especial effort is being made to extend the use of raisins in California. They are a home produced food; they can be used in an almost infinite variety of ways; they are wholesome, delicious, nutritive and a saver of sugar.

A Sun-Maid Raisin cook book may be secured free by writing California Associated Raisin Company, Fresno.

#### Lemon Sun-Maid Whip

Soak half a package of gelatine in three-quarters cupful of cold water for half an hour, then add one pint of hot water, one cupful sugar, the juice and grated rind of one lemon, and when it begins to set, beat in the stiff whites of two eggs and half a package of raisins. When cold serve with cream.

#### Baked Apple With Meringue

When baked apples are almost done, fill the centers with stewed raisins, cover with stiff froth made of the whites of eggs and powdered sugar, and bake for another ten minutes.

#### Raisin Tapioca

One cup raisins, one-half cup granulated tapioca, one-half cup sugar, one teaspoon salt, four cups water.

Wash and boil the tapioca until clear, add sugar, salt and raisins, which have been washed and dried. Pour into bowl, mold or put in individual cups, set in cold place until firm; turn out and serve with fruit sauce.

#### Raisin Biscuit

One cup chopped raisins, two cups flour, two teaspoons baking powder, one-half teaspoon salt, two tablespoons shortening, one-third cup milk.

Sift flour, salt and baking powder into bowl, add the shortening and rub in very lightly; add enough cold milk to hold together; add the raisins and mix. Place dough on floured board, roll or pat with hands until one inch thick, then cut with biscuit cutter and brush tops with cold milk; bake in hot oven 20 to 25 minutes.

#### Apple Sauce Cake

One cup of sugar, one-half cup of butter, one and one-half cups apple sauce, two teaspoons soda, almost level dissolved in sauce, one cup seeded raisins, one teaspoon cinnamon, one-quarter teaspoon cloves, one-quarter teaspoon nutmeg, two cups flour. Bake in a slow oven.

#### Candy Without Sugar

Two cups raisins, one cup chopped nuts, one-quarter cup honey.

Grind nuts and raisins in food chopper. Mix with honey. Pack under a weight for 24 hours. Cut into bars.

#### Oatmeal Cookies

Cream together one cup sugar, half cup honey, three-fourths cup lard or butter, six tablespoons milk, half cup Sun-Maid seeded raisins, two cups rolled oats, two eggs. Sift together two or more cups flour, half teaspoonful salt, two teaspoonfuls cream of tartar, one teaspoonful each of soda and cinnamon. Mix together and roll quite thick.

#### Raisin Chocolate Cookies

Two eggs, one cup brown sugar, one-half cup flour, one teaspoon baking powder sifted with flour, one-half teaspoon cinnamon, one-half teaspoon allspice, one cup seedless raisins mixed together with walnuts, citron, and candied orange peel, four tablespoons chocolate.

Drop teaspoon into pan and bake in moderate oven about ten or 15 minutes.

#### Raisin Marmalade

Two cups seeded raisins, one cup cooked and strained cranberries, one cup granulated sugar, one-half teaspoon salt.

Wash and dry the raisins; put through meat chopper; put in saucepan with two cups of water and the salt; boil slowly 30 minutes; add the cranberries and sugar, simmer until thick, about 40 minutes. This makes

## Styleplus Week the nation over

Copyright 1918  
Henry Sonneborn  
& Co., Inc.

**Styleplus Clothes**  
**\$21 AND \$25**

TRADE MARK REGISTERED

Each grade the same price the nation over

### America's only known-priced clothes

Styleplus Week is a national affair. What is the interest behind it? A big idea. Styleplus Week is a national exhibit of the distinctive style, fabrics, and tailoring, made possible at moderate price, by the Styleplus idea of concentrating a great volume on each grade.

Visit the Styleplus store in your town this coming week. This is the season to buy clothes with a reputation to maintain—a good time to get the Styleplus habit. If you do, you will satisfy your pride, get good quality and keep your outlay on the *thrift spirit* basis. The values in Styleplus Clothes stand out *better than their price*. You know the price *before* you go into the store.

Look for the Styleplus Label in the coat. \$21—Green Label. \$25—Red Label.

Styleplus distributors will sell **Styleplus Clothes \$17** (black label) as long as their supplies of this grade last.

Write us (Dept. A B) for free copy of "The Styleplus Book."  
**HENRY SONNEBORN & CO., INC.**  
Founded 1849 Baltimore, Md.

a very tasty relish with cold ham or poultry.

#### North American Dish

Two cups yellow corn meal, one cup flour, one cup seeded raisins, one cup milk, two teaspoons baking powder, one teaspoon butter, one-half teaspoon salt, one egg.

Sift the flour, corn meal, salt and baking powder into bowl; add milk and well-beaten egg and the well washed raisins; mix. Pour into pan which has been brushed with melted butter, bake 20 minutes. This makes a very good wholesome and nourishing dish. Both the cornmeal and the raisins have good food value.

#### Rice and Raisins

Wash one cup of rice well, add one cup of seedless raisins, one quart of milk and one-half teaspoon of salt. Bake in a moderate oven until the rice is tender and the milk is absorbed. Serve hot with cream and sugar.

#### Raisin Pie

One cup seeded raisins, one cup sugar, one tablespoon flour, butter size of a walnut, one tablespoon vinegar, one and one-half cups boiling water, pinch of salt. Bake in a double crust.

#### Raisin Custard Pie

Line a deep pie tin with rich crust and bake; grind one-third box of seedless raisins, add a small amount of water and cook, thickening with a scant tablespoon flour and sweeten with one tablespoon sugar. When cool spread in bottom of crust. Make a custard of one pint of milk and yolks of two eggs, beaten together; as it is heated, add three tablespoons of sugar and one heaping tablespoon of cornstarch mixed. When cooked remove from fire and flavor with vanilla. Pour custard over the raisins in the crust and lastly cover with beaten whites of eggs. Brown in oven.

#### Rice and Raisin Pudding

One-half cup seeded raisins, one-third cup rice, one-half cup sugar, three cups milk, one cup water, two eggs, one-quarter teaspoon nutmeg (may omit).

Wash rice and place in double boiler with one cup water. Cook until water is absorbed. Add two cups milk, cook until rice is tender. To the remaining one cup milk, add the sugar, spice, and well-beaten eggs, combine with rice, and raisins, pour into pudding dish, set in pan of hot water and bake until custard is set.

#### Salad

To one cup of seeded raisins, add one cup of diced apples, one sliced banana, one shredded orange and mix lightly with a generous amount of sweetened and flavored whipped cream—or mix with mayonnaise. Sprinkle with chopped walnuts and serve.

One-half plumped raisins, two medium sized apples, one stalk celery, one-half cupful nutmeats, one-half cupful marshmallows, lettuce leaves, mayonnaise dressing.

Pare and core the apples and cut in small strips, chop the celery fine and quarter the marshmallows. Toss all together and serve on lettuce leaves with mayonnaise dressing.

—LIBERTY BOND—

#### ONE WEEK'S BUDGET FOR A FAMILY OF FIVE IN CANADA

This is what Canada asks of her people. Divide this allowance by five and compare it with what you are eating—and Canada is fighting our battles.

Milk—Seven quarts whole milk.

Fruit—Fourteen pounds according to season.

Fats—Two pounds butter or oleomargarine; one pound cooking fat.

Sugars—Three pounds of sugar; one pound corn syrup, molasses or honey.

Cereal Products—Ten pounds flour; ten pounds cereals in other forms.

Fresh Vegetables—Forty pounds potatoes; 14 pounds other fresh vegetables.

Meat and Meat Substitutes—Four pounds lean meat; two pounds fresh fish; one pound salt fish; one dozen eggs; one pound cheese; two pounds dried beans or split peas.

#### THE THRIFT STAMP ARMY

By Elias Lieberman

Out of the poor man's strain and stress,

Out of the rich man's fruitfulness,  
Millions and millions of little me  
Assert the might of democracy.  
We come in squads, platoons and files;

Our ranks stretch out for many miles;

Proclaimed by neither fife nor drum  
But sure as Loyalty we come!

We come! We come!

Our silent army plods ahead,  
Our bugles never blow retreat;  
Our ranks defy the whizzing lead,  
We fear not frost, we fear not heat,  
But grim as Death and like him dumb

We march ahead. We come! We come!

The rich man's feast, the poor man's crumb

Alike give life to us. We come!

We come! We come!

—LIBERTY BOND—

#### HOW HE GOT STAMPS

One of the Seattle dailies offered the school children a prize for the best essay on thrift stamps. A little fellow wrote this: "My muther give me 25c and told me to go to the barbur and have my hair cut. I went down town but I didn't have my hare cut I bought a thrift stamp. In a few days my gran paw give me 25c and told me I better get a hair cut. I went down town, but I didn't get a hair cut I bought a thrift stamp. Then my daddy give me 25c and said for pitty sake go down and have that red mop cut. I went down but I didn't go to the barbur I bought a thrift stamp. An if I can buy thrift stamps by lettin my hare grow I'll let it get as long as Rip van wunkles and I ain't no sissy either.

—LIBERTY BOND—

#### WEIGHTS AND MEASURES IN COOKING

One ounce flour, four level table-spoons.

One ounce butter, two level table-spoons.

One ounce ground coffee, five table-spoons.

One ounce cornstarch, three level table-spoons.

One ounce thyme, eight level table-spoons.

One ounce grated chocolate, three level table-spoons.

One ounce pepper, four level table-spoons.

One ounce salt, two level table-spoons.

One ounce mustard, four level table-spoons.

One ounce cloves, four level table-spoons.

One ounce cinnamon, four and a half level table-spoons.

One ounce mace, four level table-spoons.

One ounce curry, four level table-spoons.

One ounce chopped suet, a fourth of a cup.

One ounce olive oil, two table-spoons.

—LIBERTY BOND—

#### RUN BOATS WITH FISH OIL?

According to "Politiken," of Copenhagen, experiments have been made with motors for fishing boats to determine the practicability of using fish oils for operating motors. It is said that this has proved a success, and that it may be possible for the fishermen who now have boats equipped with kerosene motors to make some slight changes which will enable them to operate with fish oils. It is even proposed that the fishermen may make their own cod-liver oil while on the sea for use in their motors.

—LIBERTY BOND—

#### OUR LITTLE HIMMAHATE

We hope the Kaiser, when he dies,  
Will go to his sarcophagus  
With all his dirty, boastful lies  
Rammed down his blamed esophagus.

—LIBERTY BOND—

A single front, a single army, a single people.

## Superior Player Pianos

We handle the products of the famous Aeolian Co., the largest Piano manufacturers in the world, makers of the famous Pianola, the Stroud, Steck, Wneelock and Weber Pianos and the wonderful Aeolian Pipe Organ.

We offer as our lowest priced player the 'Aeolian Player Piano, which contains most of the features of the Pianola—it is a beautiful instrument, sweet toned, plays all the 88 note music. It will give much pleasure and render long and efficient service. Price \$480.

Then we offer the Pianola line. The Pianola is distinguished from all other player instruments because of its many exclusive and wonderful features—the Metrostyle, the Themodist, the Automatic Sustaining Pedal, etc., etc. The Pianola line begins with the Aeolian Pianola at \$585; then the prices range upward according to the Piano model—whether in the Stroud, Steck, Weber or Steinway.

The climax of the Player line is the Duo-Art—which is first a "straight" piano; secondly a player piano playing any roll, the motor being operated electrically enabling the player to devote his entire attention to the expression devices; and thirdly—with the special Duo-Art rolls, reproducing the actual playing of the world's great artists—Bauer, Gabrilovitch, Grainger, Saint Saens and scores of others. (We cordially invite you to hear this marvelous instrument).

We will arrange convenient payment terms on any Player instrument.

We invite you to call at any of our stores—or write us asking for illustrated catalogues and prices.

We are dealers in Steinway and other Pianos, Pianola Pianos, Aeolian Player Pianos, etc.

## Sherman, Clay & Co.

## Veterans—

## HORSE SHOE TIRES

Real worth in tires is proven only when a high percentage exceed their guaranteed mileage and become veterans of extra long and heavy service : : : : :

The seventy-five hundred mile guarantee on Horse Shoe Ford Non-Skids is just a starter for 'em—ten and fifteen thousand mile veterans are common and twenty and twenty-five thousand mile Horse Shoe Veterans not unknown.

## RICE

By agreement between the growers and millers of rice and the food administration, prices for California rice have been fixed as follows: Paddy rice, \$4.10 per 100 pounds to the growers; cleaned rice, \$7.10 per 100 pounds from the mills to the trade, and \$8.00 per 100 from jobbers and wholesalers to the retailers.

## HAY

Under date of April 13, Scott, Magner & Miller says:  
Receipts past week, 993 tons. Although there is a considerable decrease in the receipts the demand has been very light and it has been difficult to move arrivals to advantage. Large quantities of alfalfa have been offered during the week. Demand for stock hay is particularly lax owing to the abundance of pasture. The car situation has not shown much improvement of late and it is difficult to get cars in many places. The cutting of first crop alfalfa on the river will commence shortly and advices are to the effect that it has already started in the lower San Joaquin.  
Fancy Wheat Hay (light five wire bale) .... 27.00@28.00

Hemp ..... 5@5½  
Rape ..... 2½@3

## Citrus Fruit Market

Los Angeles, April 17, 1918.

Valencias are beginning to go forward and are receiving good prices. The earliness of the season is not yet realized by the Eastern market which is still somewhat doubtful of the sweetness of the fruit, and its principal demand is still for Navels and seedlings. The heavy run of small seedlings, Sweets, St. Mikes, and Bloods is lowering prices on these varieties. Shipments of oranges from Southern California have been averaging 85 cars daily; from Central California 20 cars.

The lemon market is lower but very satisfactory. Foreign lemons sold in New York have been of poor quality. Pickings in the La Habra, Whittier and Ventura County districts are heavy.

Shipments  
Cars of citrus fruit from California since November 1, 1917: Southern California, oranges, 7441; lemons, 1925; total, 9366. To same date last season: Oranges, 18,371; lemons, 3151; total, 21,522. From Central California: Oranges, 2297; lemons, 115; total, 23,085. To same date last season: Oranges, 4059; lemons, 164; total, 4223. From Northern California: Oranges, 203; last year same date, 844.

## AT THE AUCTIONS

April 10

New York: 16 cars. Navels, 3.80-6.40; Seed, 4.80-5.55, Sweets, 4.90-5.30, Bloods 5.25-5.45, St. Mikes 5.20-5.45, lemons 4.60-4.80.

April 16

New York: 20 cars oranges, 5 lem. Nav. 3.00-6.60, Val. 4.60-6.00, lem. 2.90-4.45.

Philadelphia: 3 cars. Nav. 3.40-6.20.

Boston: 7 cars. Nav. 3.50-5.50, Sweets 5.30-6.05, Bloods 4.15, lem. 3.30-5.00.

## MARKET NOTES

Los Angeles markets have been so filled with potatoes that almost disastrous prices have obtained, but it is now predicted that the bottom has been reached and recovery will soon be made. Northern Burbanks are now quoted around \$1.35 and some even as high as \$1.65, the latter figure being a material advance. Northern potatoes are not now coming into market though many Idahos are arriving.

The strawberry has been very slow in appearing in market this spring and the fruit has been in need of liberal sugaring. However, arrivals are more frequent, and another week will see immense quantities in the market. Imperial fruit has been the principal early fruit, and the Gardena section will not begin until next week.

Shipments of cabbage will be very heavy for the remainder of this month and probably all of May. There has been serious loss in the cabbage fields this year because of going to seed. Lettuce quality has also been under normal this season.

Southern California celery shipping has practically ceased for this season. Early cucumbers are in bloom.

The exceptionally high price which has obtained with cotton finally broke, and \$4.00 per bale has been cut off from New York prices. One cause of the break has been the conference at Washington of cotton manufacturers and the possibility of the government taking a hand in price fixing. Brokers have ceased handling to a large extent, and the manufacturer buys only from hand to mouth.

For the year preceding April 1, 1917 the local inspection office of Omaha handled from Wyoming, South Dakota, Nebraska and Montana 768,029 range cattle.

All butchers and retail meat dealers in Boston have adapted the "cash and carry" plan, though some who have conducted a credit business for years continue, but add three per cent to all prices.

Wheat on farms March 1, 1918 was esti-

mated to be 111,272,000 bushels. This is slightly greater than the amount in 1917 and less than half that of 1916. The average covering a period of years is 150,000,000 bushels, or 22 per cent of the entire crop.

During the month of February the prices paid to producers of the United States increased 6.3 per cent on the principal crops; on March 1 prices were about 39.9 higher than a year ago, or 108.4 higher than two years ago.

By agreement between the growers and millers of rice and the food administration, prices for California rice have been fixed as follows: Paddy rice, \$4.10 per 100 pounds to the growers; cleaned rice, \$7.10 per 100 pounds from the mills to the trade, and \$8.00 per 100 from jobbers and wholesalers to the retailers.

#### —LIBERTY BOND—

#### PARTIAL LIST OF CALIFORNIA SHIPMENTS

From post card reports to the bureau of markets, United States department of agriculture, Miss Hoey makes report of the following shipment of cars of products from California for the week April 8 to 15: Apples, 4; artichokes, 24; asparagus, 56; cabbage, 56; cauliflower, 8; celery, 1; dried apples, 10; dried apricots, 2; dried beans, 8; dried peaches, 9; dried prunes, 27; lettuce, 41; mixed vegetables, 64; mixed fruit, 6; mixed fruit and vegetables, 1; mixed dried fruit, 2; onions, 11; potatoes, 15; raisins, 23; rhubarb, 9; Mexican tomatoes into state, 34; dried olives, 1; green olives, 1; dried corn, 1.

#### —LIBERTY BOND—

#### HINTS FOR TRACTOR USERS

Some reasons for loss of compression:

1. Valve not seating due to improper adjustment of tappet rods.

2. Carbon between valve and seat, or pitted valves.

3. Broken piston ring.

4. Worn pistons or cylinders.

What to do:

1. Adjust tappet rods to thickness of plain business card.

2. Clean and grind valves.

3. Renew piston rings.

4. Renew pistons.

Why the motor misses:

1. Broken porcelain in spark plug.

2. Broken wire from magnet to plug, or broken battery wire.

3. Magneto points pitted or improperly adjusted.

4. Distributor brushes dirty.

5. Improper adjustment of carburetor.

6. Oil level too high, foul plugs.

Why the engine knocks on a hard pull:

1. Carbon deposits in cylinders which becoming hot pre-ignites.

2. Carburetor adjustment too rich.

3. Sparks up too high.

4. Loose bearing.

What to do:

1. Clean out carbon and it is well to grind valves at the same time as there will be a carbon deposit formed on seat.

2. Shut off carburetor until motor spits back on open throttle, then open very slightly.

3. On hard pulls it is best to run motor with a slightly advanced spark, getting more power as it is desired by feeding more gas. Spark is speed, gasoline is power.

#### Motor Starts Hard

This may be due to weak spark.

Where batteries are used, keep them dry. If machine is standing out of doors keep the magneto covered as a damp or wet magneto grounds and will not produce a spark strong enough to ignite the mixture. Air adjustment on carburetor may be set to allow too much air to enter. If you have no way to choke the carburetor cover the air intake with a cloth until motor warms up. This will allow the motor to draw in a rich mixture which will start more easily. If you have the position of the needle valve marked it will sometimes help to open the needle valve just a trifle until the motor is warm, then it can be closed again to the former position. As a rule a motor starts harder in cold weather, due at the present time to the low grade of gasoline, which will not vaporize as readily as when the

weather is warm. In cold weather it is good policy to have a hot tube connected from an exhaust line to the air intake on the carburetor. This will insure a much better mixture and give a smoother running motor.

#### Motor Stops Suddenly

Causes to look for:

1. Broken porcelain on spark plug.

2. Broken wire to plug.

3. Float valves stuck, caused by dirt in float chamber.

4. Water in gasoline. Drain carburetor for water.

5. Obstruction in feed line to carburetor caused by waste or other foreign substance in gasoline line.

#### Motor Runs Hot, Water Boils

A low or retarded spark will cause a motor to overheat almost as rapidly as lack of water in the water system. Always work the motor with as high a spark as will pull the load to best advantage. Watch your motor and you will find that at a certain position of your spark lever it will run smoother and do better work than in any other. As you wish to run slower or faster feed the gasoline for the difference in power or speed.

An obstruction in the water line from old hose closing up, or dirt in the radiator caused from sediment or rust will retard circulation. Drain your radiator or renew your hose as the case may be. By watching your cooling system and being sure that the water is circulating you will find that your motor is much more efficient and uses less gasoline. Internal combustion engines are most efficient when the temperature of the water in the cooling system is just below boiling point.

Oil is another factor that is to be taken into consideration. Poor oil is expensive at any price. It will not only cause a motor to heat but will burn out bearings and form carbon deposit in the combustion chamber; in fact it would be a source of grief from start to finish. Good oil not only prolongs the life of the motor but helps to keep trouble out.—Successful Farming.

#### —LIBERTY BOND—

#### WHY KEEP SHEEP

Why the average American farmer should keep at least some sheep upon his premises.

1. The initial investment in foundation stock is small.

2. Expensive buildings are not necessary.

3. Expensive machinery is not required.

4. Less productive land can be utilized.

5. Sheep will eat and relish almost every class of weeds.

6. By cleaning out the fence rows sheep destroy the winter protection of many injurious insects.

7. Due to the fineness of the mastication of their food, very few weed seeds are found in sheep droppings.

8. Sheep are of great value in clearing brush land.

9. Sheep are dual purpose animals.

10. Crop yields are increased by the constant and uniform distribution of rich manure.

11. The excreta of sheep is rich in nitrogen and potassium.

12. Less plant food is removed from soil by sheep than by grain crops.

13. The cost of maintenance is small.

14. Sheep make profitable use of fodder left in corn fields after corn is harvested.

15. Sheep can be made marketable without grain.

16. Wool and lambs are more easily transported than grain crops.

17. Rapid and frequent monetary returns.

18. Reasonably large percentages of profits under normal conditions.

19. Wool and mutton advanced in price before the war and a sudden drop in value is not to be expected.

20. Less labor is required on a sheep farm than on a grain farm.

21. Labor on the farm is more evenly distributed throughout the year.

22. Sheep require little care except during the usual slack periods.

23. Children as a rule like sheep and this is a good time to develop future shepherds.

24. A flock of sheep on the farm furnishes a fresh supply of meat at any time of the year.

25. Because of the comparatively low cost per animal, sheep are more easily improved than most other types of live stock.

26. Sheep are more prolific than horses and cattle.

27. The Western sheep ranches are rapidly disappearing and it is up to the small farmers to make up the deficiency.

28. The population of the United States is increasing, while the number of sheep is steadily decreasing.

29. As a patriotic duty in the present world crisis, we must produce more wool and mutton.

#### —LIBERTY BOND—

#### BURN WOOD AND SAVE COAL

The United States food administration is appealing to every home in the land to burn wood for heating, and so far as possible for cooking purposes. California is not wooded as much as many Eastern states, but we believe it has done more towards growing its own fuel than any other state in the Union. On account of this thousands of trees will be planted this spring. Every eucalyptus tree planted means a saving of coal and possibly a more valuable service.

#### —LIBERTY BOND—

#### INVESTMENTS FOR FARMERS

"The investments of the farmer which may pay the largest interest are the investments in fertilizers, in good live stock, in good machinery and other forms of equipment." —Dean F. B. Mumford, University of Missouri.

#### —LIBERTY BOND—

Sour orange trees of the Seville district of Spain were seriously injured by frosts last spring. The crop of the

whole of Andalusia for the past season was only 60 per cent of normal in consequence. Practically the entire crop goes to Great Britain for government use, being made into marmalade for the soldiers.

#### —LIBERTY BOND—

A survey of the soft-corn situation is being made by the department of agriculture throughout corn producing sections of the Union. Speedy handling of the large supply of soft corn in the country is necessary if the crop is to be saved.

#### —LIBERTY BOND—

Experiments are being made in manufacturing "leather" from fish skins. The United States bureau of fisheries reports that considerable success has been attained along this line. What next, we wonder! But let 'em come.

#### —LIBERTY BOND—

#### A PIECE OF GOOD FORTUNE

In these days of high prices it is refreshing to find one article of nationwide demand that costs no more now than it did before the war.

The Youth's Companion subscription price, \$2.00, will not be increased nor will the contents of the paper be diminished. The 52 issues of 1918 will be packed full of the best stories by the most popular writers. The editorial page, the boys' page, girls' page, family page and all the departments will continue to bring a vast amount of cheer, good entertainment and information for every reader in the family circle.

By special arrangement new subscribers for The Companion can also have McCall's Magazine—the fashion authority—for 12 months, both publications for only \$2.25.

Beginning with the issue of April, 1918, McCall's Magazine is doubled in volume, its page being now the same size as The Youth's Companion's. For the present there is no advance in price, and the offer of the enlarged McCall's and The Youth's Companion for \$2.25 is an unparalleled bargain.

Send all orders to The Youth's Companion, St. Paul Street, Boston, Massachusetts.

#### —LIBERTY BOND—

#### FEATURES OF SAMSON SIEVE-GRIP TRACTORS

The Model S-25 Samson Sieve-Grip tractors have several exclusive and patented features which place them among the foremost of light farm tractors on the market today. The outstanding features of this effective machine are; the Sieve-Grip wheel, lubricated roller pinion, No-dust-Moist-Rizer, automatic control.

Every farmer who is in reach of the great demonstration to be held in Davis next week should be on hand and ask the Samson man regarding the details of these valuable features.

#### —LIBERTY BOND—

#### INDEPENDENT IRRIGATION

Mrs. M. Salque has leased her 60 acre ranch south of Los Angeles and, to be sure of a water supply, has purchased a Layne & Bowler 40-foot 12 inch pump, to be driven by a 20 horse power G. E. motor.

#### STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS, MARCH 21, 1916.

of California Cultivator, published weekly at Los Angeles, Cal., for April 8, 1918.

Before me, a Notary Public in and for the State and county aforesaid, personally appeared Frank H. Thomas, who, having been duly sworn according to law, deposes and says that he is the publisher and business manager of the California Cultivator and that the following is to the best of his knowledge and belief, a true statement of the ownership, management (and if a daily paper, the circulation), etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations, printed on the reverse side of this form, to-wit:

1. That the names and addresses of the publisher, editor, managing editor, and business managers are:

NAME OF—  
Publisher, Cultivator Publishing Co.  
Editor, C. B. Messenger  
Managing Editor  
Business Manager, Frank H. Thomas  
Los Angeles, Cal.  
Los Angeles, Cal.  
Los Angeles, Cal.

2. That the owners are (Give names and addresses of individual owners, or, if a corporation, give its name and the names and addresses of stockholders owning or holding 1 per cent or more of the total amount of stock.)  
Cultivator Publishing Co.  
Frank H. Thomas  
R. M. Teague  
Los Angeles, Cal.  
San Diego, Cal.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: (If there are none, so state.)  
None.

4. That the paragraphs next above, giving names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities as so stated by him.

5. That the average number of copies of each issue of this publication sold or distributed, through the mails or otherwise, to paid subscribers during the six months preceding the date shown above is—  
(This information is required from daily publications only.)

Sworn to and subscribed before me this 26th day of March, 1918.  
M. E. STORRS, Notary Public in and for Los Angeles County, California (SEAL)  
(My commission expires March 22, 1921.)

# Facts Versus Claims

## As Good as Eight Horses

"We have done just as much work with our 10-20 Model J as could be done with eight head of horses.

"We broke 40 acres of sod, pulling two 14-inch plows; harvested 300 acres pulling two binders without a horse in the field.

"We threshed 400 acres of wheat, using a 20x36 separator; plowed about 250 acres of stubble land, with three 14-inch plows; disced about 70 acres, and drilled 310 acres, pulling two 12-disc drills and hauled the hay loader.

"During all this time we used \$140.00 worth of kerosene, including a small amount of gasoline, and \$40.00 worth of lubricating oil.

"Even if eight head of horses could be fed on \$180.00 the same length of time, the tractor is the cheapest, because the next eight months it doesn't cost anything while the horses are still eating their feed. Our farm power will always be 'The Little Fellow With the Big Pull.'"

Your tractor friends,  
VICTOR JOHNSON & SON.

(Address upon request.)

## How to Choose Your Tractor

There are certain fundamental principles upon which you can judge a tractor and its adaptability to your particular requirements. You can base your opinion upon facts and reduce to a minimum any element of uncertainty or gamble.

Claims, coupled with so many different types of tractors, are no doubt confusing. Everyone has the "best." Mere claims, however, mean nothing to you.

### STUDY THE SPECIFICATIONS

There are no restrictions on rating a tractor. By studying the motor specifications, method of power transmission and drive, together with the weight and traction surface, you can figure out the reasonableness of one claim as compared with another. And isn't it wise to lean toward the tractor which has been tried and proved over a period of years, conservatively rated and backed by a reputable manufacturer rather than the one for which unbounded claims must be made in order to find a market for it?

Price per pound is a poor basis for comparison. Cast iron requires heavier though cheaper construction than steel. Even steel castings are heavier though less costly than drop forgings. Bearings and bearing metals vary in cost from a few cents to more than a dollar a pound—STUDY AND COMPARE THE SPECIFICATIONS!

Sandusky Tractors are not built to meet price competition. There are many places wherein it would be possible for us to reduce the cost of manufacture without changing the appearance of these machines. They would no doubt work just as satisfactorily at the beginning. Is it reasonable to assume, however, that they would last as long? That they would be as dependable? That they would be as cheap in the long run? You can answer these questions yourself.

### SATISFACTION GUARANTEED

We guarantee The Sandusky Tractor to do satisfactory work on your farm. We demonstrate its ability to fulfill our liberal operation guarantees and then stand back of every machine, not only with a full year's guarantee, but also with the only Guaranteed Free Service plan in existence.

### WRITE FOR BOOKLETS

Write for a free copy of "Power On The Farm," issue J-76 covering the Model J, or issue E-76 covering the Model E. They fully cover design, construction and ability of both machines, besides containing worth while information for the man considering the purchase of a tractor.

April 27, 1918

SAN FRANCISCO

## *Beginnings of the Tractor Epoch*

× ×

WENTY-FIVE YEARS ago Myron W. Reed, a pulpit orator, said the world had been fit to live in only fifty years, or since the invention of the shear plow.

We are wondering if some pulpit orator will not say fifty years from now that the world has only been fit to live in since the invention of the farm tractor.

Horse power and forces of wind and water have been used. Today the farmer says: "let gas do it." While the boys are going to the trenches to save human beings from barbarism and to save the world's liberties the farmer is turning every way to find the "hand" to take the place of the patriotic boys and be equally patriotic himself. The "hand" is now presented in the form of the gas engine and the tractor.

The replacing of the crooked stick with chilled iron or steel, and the scythe and cradle with the reaper, mark epochs. Children of today will tell the kiddies of a half century later of the wonder days of world war when civilized liberty loving people banded themselves together to save the world and "about that time came the tractor, product of the world's best brains, and it bore a large part in the saving of mankind."

\* \* \*

*One outstanding milestone in the beginnings of this epoch is described on the next two pages of this issue. Turn over the leaf.*

**Steel Mule**  
Orchard type of tractor handling triple bottom Deere plow. This was the newest tractor on the grounds, arriving on last day.

**A Made-Over Tractor**  
The Los Angeles tractor pulling a single Knapp disk. Only chassis of a Ford, together with the Los Angeles attachment, used in construction.

**The Avery, One of the Big-Wheelers**  
"There is a size Avery tractor to fit every farm," in fact, it is built in six sizes.

# Man Power Must be Increased on Farms

The World is Hungry—How May It be Fed? An Answer—a Partial Answer at Least—Given at the Great Tractor and Implement Demonstration Last Week. 30,000 People See Power Farming Exemplified. California Cultivator with Two Cameras and Three Observers Brings Some of the Inspiration of the Great Event to Its Readers. Other Illustrations on Page 550.

Editorial Correspondence

**T**HE Tractor and Implement Demonstration was a complete success. It began Wednesday morning, April 17, and ended officially at sunset, April 19. In reality it continued during the University Farm Picnic, and even to a limited extent on the following day. It was held on lands near the University Farm some 15 miles out from Sacramento.

There were thousands of autos, everyone filled, each day of the demonstration. The daily attendance is known to be in excess of 10,000. A disagreeable wind blew the first two days. One of the tents housing the truck and general exhibits was nearly destroyed, and dust was everywhere. Friday's weather was perfect. The official opening event was the banquet held on Wednesday evening. A royal good time was given to every attendant.

The officers of the association are W. H. Gardner, of the Yuba Manufacturing Company, president; C. E. Witherell, Samson Sieve-Grip Company, vice-president; G. M. Walker, Holt Manufacturing Company, secretary-treasurer; Eugene Smith, business manager.

There were 24 tractor companies and seven implement companies exhibiting and 41 different makes or sizes of tractor and 126 implements exhibited.

The three days demonstration gave the open-eyed farmer opportunity for adding liberally to his education.

\*\*\*

Two hundred million men have  
Continued on Page 527 Col. 4

By C. A. Briggs

**T**HE tractor demonstration seemed to me to be the biggest ever in California in attendance, in contestants for the farmer's favor in fine tractors and most of all in tractor tools. Every tried, tested and proven tool was there. To name them all would read like a catalogue, and anyway no one would want to read it for every one was there from Shasta to Calexico. All the old timers, and many new ones were there; "No, John, I tell ye ye'r wrong; John Deere for me." "Oh pshaw Bill, you know the Oliver is better, only ye'r so dern stubborn ye won't admit it." The Casaday "Easy way" engine gang had its admirers, the P. and O. was doing good work, McCormick and Walter A. Wood were still names to charm, while the Giant Killers, disks, chisel cultivators and heavy duty subsoilers had an easy job on the 260 acres of fine soil when they would have welcomed the hardest of hard pan. Holt's disks and plows were used by the caterpillars. Knapp's tractor plow didn't take a nap for three days, Sanders disks did good work. The Light Draft Harrow Company and spring tooth harrows were liked. The Clark Cutaway disks, the land rollers and clod crushers were in evidence, while Schmieser's gigantic land levelers, checkers, ditchers and harrows had a crowd around them all the time. Everybody wanted either an Avery motor planter, cultivator or a Cleveland special of similar type, disks in and out throws, cutaways, engine gangs of every description, hitches to handle any kind of outfit, tractors plowing with all of the best plows, harrowing with all of the best harrows. Thousands of farmers were looking, listening, talking, learning, buying. It was some demonstration and means much for our state of California and the crops that are to help feed a hungry world.

By J. B. Neff

**E**DITOR CULTIVATOR: Replying to your request for information as to my success with a tractor and my views concerning the good and bad points of farm tractors. Perfect tractors are not on the market yet, neither is the perfect automobile, but like autos some are better than others, especially for a particular use since a man would not buy a tractor for a grain farm and expect it to work equally well in an orchard. I wanted a tractor for orchard work which would run under the branches of walnut trees and close to the orange trees, so looked at those suitable for this work. Then I wanted one which would pull its load and keep on top of the ground; which would turn in the smallest possible space; which was strongly built, of good workmanship and with the best of facilities for keeping all the working parts well lubricated. I also wanted one which was economical of fuel and would burn almost any fuel and keep going, as well as having the fewest possible intricate parts.

I thought it best to have the tractor on hand in advance of the time it was needed for work, so bought it early in the winter and had my operator (whom we will call Chester) put in spare time hauling brush or harrowing so as to get accustomed to its management before the heavy work began. I had been using three mules to farm 60 acres of orchard. This was too much for the team, so wanted the tractor to do the work of four or five  
Continued on Page 547

By M. C. Holman

**T**HE California Tractor and Implement Association under the direction of Eugene Smith pulled off the most successful tractor meet ever held in California and the largest in the number of separate entries ever held in the world. And the thrill of it all, the excitement of the friendly contest for individual supremacy, the great strips of earth being turned over at a single trip, the dust, the wind, the hunger and thirst will always be remembered by those whose good fortune it was to be present. And there were thousands of people in attendance. I cannot fail to believe that hundreds of tractors will find places on California farms as a result of the demonstration.

From the first "dip" on Wednesday morning till the last "lift" on Saturday night, there was a constant stream of tractors plowing up various sections of a large field that was placed at the disposal of the association.

You will undoubtedly agree that tractors divide themselves quite naturally into four divisions.

The analysis places them in two classes. They are either the wheel type or the tracklaying type. Again they are either the large field tractor or the small orchard tractor. And for every purpose there is a tractor. One has but to know his needs to discover that some manufacturer has anticipated those needs and the tractor is ready to purchase. No one need forego the benefits of having a tractor on the ground that "It isn't

**Some Harrow**  
This is not a make-believe harrow, but one arranged for field service. It is exhibited by the Schmeiser Manufacturing Company.

**De Laval Sales Force**  
Nearly a dozen Pacific Coast representatives and salesmen required to give information as to the Lauson and other exhibits of the De Laval people.

**Interior of One of the Tents**  
Every form of truck was exhibited. Some of the trucks were used to demonstrate usefulness on the farm.

#### Both Interested in the Cleveland

The Cleveland tractor. The man standing with three checks in his hand is F. H. Stow, northern representative. In center is Mr. Briles, Los Angeles representative.

suited to my needs." It is just a matter of seeking farther and the right one will be found.

The admirable arrangement of the tents and exhibit grounds gave ample opportunity to see one's favorite tractor at work, and every farmer has a favorite, even though he may not actually possess one.

Each exhibitor shared equally the large field and secured about 100 by 1200 feet. That space was used for private demonstration. The large general space, occupying about 100 acres, was located about two miles from the private demonstration grounds. This was an objectionable feature as it required an auto to travel back and forth. As a consequence many did not get out to the large field. The individual field was quite large enough to give a complete and prolonged demonstration. Let us see, if we can, the several tractors in action and picture in the mind's eye the large and small machines that played so important a part in that successful demonstration.

A particularly amusing feature accompanied the opening of the demonstration. In an adjoining field were some 15 or 20 horses and mules that had been put to pasture. They stood upon an embankment with ears pricked up and peered inquiringly into the tractor field as if to say; "You are taking my job away."

Among the smaller tractors the Bean proved of special interest, performing stunts in an improvised orchard, dodging trees and turning corners at a very sharp angle. It handled its plows and cultivators with remarkable ease. The Bean is a six horse power machine with a speed of two and one-quarter miles per hour. It weighs 3100 pounds and is 102 inches long.

The Lauson 18 proved to be a tractor of special design. It is new to the Coast and was given its first tryout. A good feature of this tractor is the fact that the engine is enclosed, somewhat after the fashion of an automobile, preventing dirt from getting in. The Lauson has a 15-25 rating,

weighs 5000 pounds and has a belt speed of 2300 feet per minute.

The Fageol tractor was also shown for the first time, having just been completed after undergoing exhaustive tests.

The International, a small tracklayer, manipulated four disk plows with an ease that showed great reserve power. It is an 8-16 tractor weighing 4000 pounds. The wheel base is 85 inches and the entire length over all is 132 inches.

The little Los Angeles tractor represents the typical baby type as it is only four horse power on the drawbar. It was the smallest tractor at the show, but should find a place on many farms where great power is not required or where a boy must be used for tractor work.

The Cleveland is a comparatively new tractor to the Coast but has already made a host of friends. It is a 12-20, 96 inches long, has a turning radius of 12 feet and weighs 3000 pounds. Its work was particularly pleasing and it handled the load with ease.

The Bates Steel Mule in its present form is much preferred to the old style, as it now conforms to the standard type. It is a 12-20, with a drawbar horse power of 16 and as a stationary plant, over 25 horse power. Its length is eight feet nine inches with a weight of 4300 pounds.

The Fitch four drive was permanently stationed with one front wheel on top of a large log, showing an arrangement of the axle attachment which allows the tractor to surmount all obstacles and at the same time hold its equilibrium.

The Waterloo Boy was constantly at work. It is given a 12-25 rating and is capable of a 2100 pound pull. Its ease of manipulation and ready response to the operator are prominent features not to be overlooked.

The Samson Sieve Grip represents the perfect type of medium power tractor and is well suited to large and small jobs. It has a 25 horse power rating and is capable of over 3000

pounds pull. It will travel four miles per hour. The belt speed is 3740 feet per minute.

The two sizes of the Yuba lead us from the small and medium to the largest of the tractors. The small Yuba has a 12-20 horse power rating, and will pull 3400 pounds at a speed of two miles per hour. It will make a complete turn in 16 feet and when on a straight pull will travel on high gear at the rate of four miles per hour.

The large Yuba has a rating of 20-35 and will haul 5000 pounds on a sustained pull. This was done at the demonstration. Its length over all is 15 feet and it will make a complete turn in 16 feet.

There were three good models of the big wheel type, the Avery, Sandusky and Altman-Taylor. They showed wonderful tractive power. The long extension lugs on the Avery gave it special traction and made the wide wheels doubly wide. This machine is particularly suitable to sandy soil and will succeed where other tractors would fail.

The Sandusky pulled a combination of plows that would stall any but the most powerful tractor.

The Russell tractor of the 20-40 type pulled deep set mould boards, showing a traction power that will meet any demand.

The Advance Rumely is rated at only 12-24, but its work at the demonstration made one feel that there was at least no exaggeration. It handled full load of both mould board and disk plows.

For supreme power, a power that knows no ending, a power that never falters, we have two machines of the tracklayer type, the Holt and Best. At times it appeared that these machines were vying with each other to see which could outpull, but added plows made not the slightest difference. They are both of the powerful 75 type. When greater machines are wanted they will probably be built, but if they are good enough for the tanks of Europe, surely they are good

enough for the tractor needs of America.

Tractors at the demonstration ranged in price from \$450 to \$5000. There was a tractor for every purse and for every need.

We need not speak of the educational features. There were these in abundance and the thousands of spectators came away with tractor knowledge a plenty.

The association plans to make the demonstration an annual affair and it should have the hearty support of every progressive farmer in California.

#### EDITORIAL CORRESPONDENCE

Continued from Page 526

been withdrawn from their normal occupations by the world war. This is the estimate of Henry Clews. These men have been drawn from all vocations, but among them none has suffered more seriously than has farming. Its labor problem is serious and to its solving the best of thought is being given. How may we grow food? How may we clothe our armies? How may the sinews of war—a war to preserve liberty to the world—be supplied?

Perhaps to say that 200,000,000 men, or nearly twice the entire population of the United States, are withdrawn from normal occupations does not mean so much to the ordinary farmer as it does to refer to his own case. Perhaps a sturdy son has gone to war or to the munition plant. The working force on the farm has been reduced 50 per cent. Ordinarily it cannot be restored, at least not with efficient dependable help. Can the farmer's ability be doubled?

A few soil tillers have found a great increase in production through the use of power—steam power, gas power, electric power. The gas engine has largely superseded the old time steamer and has made possible an effective, low priced and efficient tractor, and that tractor has moved things and moved toward success.

The "perfected" tractor is not yet

## They Mean More Mileage

Note how these sturdy shoulders brace the tread. They distribute road wear evenly over the entire wearing surface. Friction can't center in one spot to quickly grind through to the fabric. Shoulders of Strength—a special patented feature—give Ajax Tires more rubber where it should be—more tread on the road.

### 237 Race Triumphs

Shoulders of Strength, most of all, are the reason Ajax Tires are the Dirt Track Champions of America. Daredevil race drivers, using Ajax Tires, in 1917 won sweeping victories in 237 grinding dirt track races at state fairs from Texas to Massachusetts. They win on the roads you drive on.

### 97% Owners' Choice

The careful tire buyer knows Ajax Tires, with more tread on the road, will increase his tire mileage. That's why 97% of Ajax annual output is chosen by car owners to replace other tires that came on their cars.

The Ajax line is complete—headed by the famous Road King—a monarch in quality, a democrat in service. Guaranteed in Writing 5,000 Miles.

Investigate Ajax Tubes.

## Spiny Citrus White Fly

**C**UBA is fighting the Spiny Citrus White Fly, or Black Fly as it is called there, White or black, it is a foe that has struck terror to the

hearts of citrus growers in Cuba, where it is now doing deadly work, and in Florida, so short a distance away and which has only just succeeded after a bitter struggle in prevailing against the citrus canker. The following communication is from a Florida horticultural inspector who is now in Cuba as one of a force of 100 men fighting the fly. California citrus growers will want all the information they can get on the subject.

"During the last seven years a very injurious insect known as the Spiny Citrus White Fly, *Aleurocanthus woglumi* Ashby, known in Cuba as the "Mosca Prieta," or Black Fly, has come into the western hemisphere from India. During these years it made its way from India to the Bahamas to the canal zone to Guantanamo, Cuba, and from there to Havana. It now occurs in several parts of the island. At Guantanamo it most seriously affects the coffee planta-

tions. In this part of the island its principal hosts are citrus, mangoes, sapodillas, avocados, anonas, etc., preferring them in the order named.

"Fortunately it has not got into the commercial groves. When it does—'Goodnight!' Florida is next in line, and we have all the details worked out for its eradication as soon as discovered there. Our plant commissioner made a trip down here (Cuba) in October. Our general inspector was here for several weeks in January. A force of about 100 men are working at its eradication. On account of the highly efficient organization in Florida, the Cuban government requested Florida to lend two inspectors for a period not less than three months nor more than six months. Mr. Bolinger, district inspector for Broward County is to act in an advisory capacity for the eradication work. I feel safe in saying that the spread of spiny citrus white fly will spell the absolute ruin of any citrus grove that it gets into. Florida will treat any infested tree in the same way we treated the canker, by burning at the end of a kerosene torch spray."

## Green Manure Crops

The agricultural experiment station of the California college of agriculture recently issued Bulletin 292, "Green Manure Crops in Southern California." It was written by Prof. W. M. Mertz when he was connected with the citrus experiment station at Riverside. It is the most complete treatise on cover crops yet issued. We quote from Mr. Mertz' summary:

### Summary

A number of legumes make satisfactory growth when used as winter green manures in Southern California. Of these, *Melilotus indica* is the most promising; others of value are common vetch, bur clover, and Canada peas. Fenugreek and lentils cannot be depended upon to give heavy yields and the seed is expensive. Purple vetch, Tangier peas, and bitter vetch (*Vicia ervilia*) possess advantages over most of the other varieties tried, but there is as yet no seed available in commercial quantities. From the standpoint of tonnage alone, rye and barley have both given heavy yields in time for spring plowing.

The incorporation of the legume green manures resulted in much heavier yields of the summer field crops, than followed the non-legume green manures. The average yields of all legume plots when compared with that of the non-legume plots show the following increases in

yields from legume green manures; with corn, 45 per cent, or 14 bushels per acre; with potatoes, 39 per cent, or 62 bushels; with cabbage, 44 per cent, or two and a half tons; with beets, 43 per cent, or six tons; and with sorghum and Sudan grass hays, 22 per cent, or one ton dry hay. The average for all crops showed an increase of 37.7 per cent. The cultural cost of growing the field crops was the same in both cases, and if we assume that the yields on the non-legume plots, representing as they do about the state average production, are sufficient to defray the actual producing cost, this gain represents clear profit.

The use of nitrate of soda or dried blood resulted in marked increases in yield when compared with those obtained from the unfertilized non-legume plots. The average increase with all field crops was 30 per cent. This increase was brought about, however, at an average expense of from \$30 to \$35 per acre. The value of these increases did not cover this expense except in the cases of cabbage and potatoes. This was true whether large or small amounts of nitrogen had been added. With cabbage and potatoes, the high value of the product made the applications of relatively heavy amounts of nitrogenous fertilizer profitable.

## Citrus Color Standard Brings Good Returns

The citrus season just passed brought some very interesting results from the enforcement of the color standard on citrus shipments. The value of tree colored fruit is now unquestioned, especially in the case of oranges which do not test eight to one at picking time. There is also reason to believe that the eight to one test is not always a sure indication of maturity and we believe that the value of such fruit would be greatly increased if it were held a little longer on the tree. Fruit was shipped this year which tested eight to one but which was so green that it was

scarcely possible to sweat any color into it.

The following letter from the Fair Oaks Citrus Association bears on this subject and will be of interest in citrus sections:

"No doubt you will be glad to learn about the shipment of 'substantially colored' oranges during the season just closed. Our first car went forward on December 3, 1917, the last one on January 21, 1918. The total was about 43 per cent of our normal crop; result 160 per cent better than normal results. Average price per ton \$80.

"Of course not all the gain was due to color, very much was the result of a short crop everywhere, but while our Navels did not at any time reach the alleged maturity standard of eight to one, we had only good reports on every car sent out. These reports covered all points, i. e., loading, sizing, packing, color and grading. Also decay, if any, and general comments. The following is one of all we received: 'PFE 8283 Wichita. Loading good, sizing good, packing high, color very good, grading good. No decay.'

"Our long contention that good wholesome Navels may not be of a ratio of eight to one has been emphatically confirmed in the court of last resort, the consumer, and all right minded people are satisfied with tree colored product."

#### CITRUS CANCER SITUATION IN FLORIDA

Florida announces that January of 1918 is the first month since May, 1914 that not a single infected canker tree was found in Florida. Trees found infected per year were as follows:

Since the work started, 22 counties have shown infection from canker, 13,708 groves have been found infected, and 342,250 citrus nursery trees. There were 477 properties infected, including nine which have shown re-infection, and some have been sold in part and classed as separate. There are 412 classed as no longer infected. There have been 232,

999 "exposed" grove trees destroyed with permission of owners, and 2,611,514 "exposed" nursery trees have been destroyed, the owners receiving no reimbursement.

#### FRUIT GROWERS' ASSOCIATION OF AUSTRALIA WANTS EM-BARGO ON CALIFORNIA CITRUS FRUIT

State Commissioner of Horticulture Hecke writes he has recently received from E. J. Vosler now in Australia, a clipping from the Sydney Herald, which will be of interest in the citrus counties of California. Many will remember the trouble we had about a year ago when Australia tried to place a quarantine on California citrus fruit. We hope the question will not again be opened.

"E. P. Crowther, organizing secretary of the Fruitgrowers' Association, writes: 'The Herald's report under the heading of Citrus Canker contains the most damning evidence regarding the administration of the federal government. In the final paragraph its own words are quoted as follows: No hesitation in recommending the destruction by burning of all infected trees and the absolute prohibition of the fruit or any part of a citrus tree from leaving the territory. For a long time past the executive of the Fruit Growers' Association of New South Wales in season and out of season has urged upon the prime minister the absolute prohibition of imported citrus fruit from America or any other country where citrus canker exists. The request has always been met with a refusal. In the opinion of my association nothing less than total prohibition is sufficient. This is the most awful and deadly menace that could be imagined. It means certain ruin and destruction to citrus growers and involves the existence of over 2,000,000 citrus trees and the welfare of thousands of people who have worked hard for long years clearing and preparing the land, and waiting patiently for the result of their long labors. If growers would only wake up to their own interests now, and without a day's further delay join hands with the association whose executive is fighting their fight, it is not, and will not be, too late. When the government sees that the growers are united and determined, and that the association speaks with the sound of 8000 growers' voices behind it, redress will quickly come. The danger is on us; delay will be suicidal.'

#### THE FIG AND OLIVE JOURNAL

The Olive Journal which has been for nearly two years a supporter of the olive industry, especially the co-operative end of it, has extended its field, as indicated by its new title, "The Fig and Olive Journal." This journal was started in San Francisco where it was formerly published, but it has moved to Los Angeles where it is now issued. The editor is J. J. Hoey.

"The one sure way to supply the supreme need for food," reads a proclamation by Governor Bickett of North Carolina, "is to man the bread line with the woman power, the boy power and the girl power of the state."

For two years not a single new pleasure motor car has been made in England. Luxury business has ceased. The English are leading strenuous lives, but are prospering.

## Farm for Profit

### and Help U. S. Win the War

Authoritative tests have proved that as high as 50 per cent increase in crop production may be expected from proper use of fertilizer. Do you realize what that increase means? Fertilizer is the basis of crop production, and compared to the prices of the crops they help to produce, fertilizers were never so cheap as they are today.

## MORE CROPS

will be raised in America this year than ever before. Make every acre you own or rent, produce to the limit. Fertilize your land—the increase in yield and price of crops will more than pay all the fertilizer expense—it will enable you to farm with profit. Don't spend your time working worn out land. Make it pay—Fertilize with Hauser's Organic Fertilizer.

## HAUSER PACKING COMPANY

9th and Mateo Sts. **PHONE 10336-Bdwy. 5600** **Los Angeles, Cal.**

#### Perforated Tree Protectors

Why use anything but a PERFORATED PROTECTOR, which allows free circulation of air and sunshine to gradually harden the tender bark. Practically a small LATH HOUSE ABOUT EACH TREE. Protects from Squirrels—Rabbits—Gophers—Hot Sun—Sand Storms—Barking in Cultivation, etc.

We make a number of kinds. TELL US YOUR PEST, and we will tell you what kind to buy. Get our prices. We can save you money.

#### COLLAPSIBLE PLANTING POTS

Why not raise your early Tomatoes, cabbage, chili and egg plant for home use or for market. Do you know that you can start

Cucumbers, cantaloupes, melons of all kinds in these pots in flats until they have three and four leaves then plant pot and all, have melons two or three weeks earlier for market. Just the thing for Propagating Eucalyptus and Olive cuttings.

Write for samples and prices of both Pots and Protectors. State which you are interested in. THE EXPAN CO., 935E, Central Ave., Redlands, Cal.

At the bottom of your letter to advertisers just say "California Cultivator" and prompt reply is assured.

## Let Us Tell You About TIZIT SPRAY

Tizit

### Wonderful Results Attested by Many Prominent Citrus Fruit Growers who SPRAYED INTO BLOOM

TIZIT is a thoroughly tested tree spray made in California, a combined fungicide and insecticide designed after many years' experimenting by experts to meet the conditions that confront the Western Coast citrus fruit grower.

It is also unsurpassed as an insecticide and fungicide for apples and pears. Tests of last year in the apple districts proved conclusively that TIZIT spray produced better results AT LOWER COST than any other arsenical preparation.

We claim for TIZIT;

- that it will eliminate the necessity of fumigation;
- that it will clean trees of moss and lichen, leaving trees and fruit perfectly clean;
- that trees sprayed with TIZIT have proven immune to red spider;
- that it is the cheapest and most efficient spray you can use;
- that as a SPRAY INTO THE BLOOM to prevent fruit dropping it has no equal.

TIZIT contains no oil to damage your trees. We want you to read the letters we have received from TIZIT users and see results we can show.

Write today for circulars, price list, and testimonials.

## Fruit Crop Report

Rather early for estimates, but reports of general conditions from various parts of the state indicate good crop of apricots, fair of prunes and other fruits, excepting peaches which will be only a medium crop.

SHREWD buyers and shrewd growers have their eyes on the possible production of California orchards for 1918.

It is too early for either to know with any degree of definiteness, but both are watching day and night. It is probable the growers have less interest than in a normal year for many presume on the government keeping a hand on the markets and preventing speculative values, but the interest is keen on the possible output. So, following the custom of a dozen years, the Cultivator has asked for estimates. These are given below and are wonderfully interesting and may prove helpful to the California growers. It appears that California will produce a normal, or better than normal, crop of nearly all fruits. Some sections indicate only a 30 or 40 per cent crop but the longer producing sections range well up towards 100 per cent and indicate a record crop. Reports from the peach growing sections are hardly so optimistic. Regarding the peach output, the bureau of markets of the department of agriculture reports:

Reports from California made at blooming time show a high condition figure despite the unusually large crop in 1917. It is too early to report set of fruit at this time and later estimates may show a considerable reduction. The peach crop for California last year was approximately 14,151,000 bushels, the largest on record. Conditions at this time indicate a crop of about 13,218,000 bushels for 1918.

Attention is called to the fact that the California peach crop is not comparable with production given for other states, since approximately 90 per cent is either dried or canned. Estimates for other states are based on quantities reaching strictly commercial channels as fresh fruit.

Eastern states report poor conditions as a rule. One exception, however, is Georgia. Its last year's report shows a condition of 56 per cent and this year's shows a condition of 100 per cent. Other states run around 50 per cent to 80 per cent.

The reports from the growers, horticultural commissioners, and other observers are, however, more interesting. Here they are:

Geo. P. Weldon, Chief Deputy State Commissioner of Horticulture, Sacramento

Mr. Weldon is not yet prepared to give out estimates of fruit crops, but writes:

As soon as all the details in connection with the cooperative work between this commission and the bureau of crop estimates are completed we shall be glad to write you further. You may rest assured that whenever we have figures that will be of interest to you and your readers you are perfectly welcome to them and, more than that, we will make a special effort to see that you get them at the earliest possible date.

Fred K. Howard, Horticultural Commissioner, Kings County

Apricots, peaches, and prunes show a normal crop in all varieties for Kings County.

Wm. B. Jackson, Ontario, San Bernardino County

There will be a big crop of apricots if weather continues good, but in peaches there will not be any Muirs to speak of but Lovell, Elberta, Phil-

lips' Cling, and a few other varieties that are now in bloom indicate a good crop.

Fred G. Stokes, Horticultural Commissioner, Lake County

Bartlett pears show A1 prospects. Trees now in bloom.

Apricots and peaches have too small an acreage to report on.

Almonds show 50 per cent damage by frost.

Cherry acreage is too small to count commercially.

Prunes are in blossom now, undamaged but lighter than last year. Extra heavy crop last season.

All grain crops look exceedingly well.

Wm. James Hill, Redding, Shasta County

The California Cured Fruit Exchange, as foreshadowed in my letter to you last spring, is out of the fruit business, and is now trying to close up its affairs by voluntary bankruptcy, having failed to collect in the courts from its defaulting secretary-cashier, S. Ottis Walker.

So far as I can judge from the present appearance in this county I think you will find the following particulars about correct:

Apricots and almonds. Frost damaged, practically none. Neither of these are largely grown here.

Peaches. Muirs a good average crop. Other kinds more or less damaged by frost.

Prunes. Good average blooming.

Pears. Heavy blooming. Neither of the two latter have generally set yet.

There has been no material increase in bearing trees in this county.

Geo. A. Lamiman, Horticultural Commissioner, Shasta County

Regarding crop conditions I can say that they are better from some stand points than last season. The weather conditions have been better as the rains have been better distributed and have been of the gentle, easy falling kind—all goes into the soil. We have had less run off than usual. All grains and forage crops are in fine condition. The acreage is larger than last season. Stock are looking fine as there is abundance of feed.

Our fruit crops look well at the present writing. Prunes are well set and growing, pears look like a good crop, peaches aside from Muirs are not up to normal, Muirs seem about normal. No apricots as frost caught them with their coats off also the almonds though these two crops are not grown commercially with us.

W. D. Butler, Horticultural Commissioner Napa County

As to the prospects of a fruit crop in Napa County this season I will state that the season being so late it is almost impossible to give an intelligent estimate.

Cherries appear to have a normal bloom. Peaches and apricots will be about 80 per cent normal, but prunes and pears in my opinion show only about 50 per cent vitality. This I lay to the heavy crop last year and the very hot summer and dry fall and early winter.

E. O. Amundsen, Placer County

Pears have set heavy crop and show little injury by frost.

Have only 50 acres of apricots in the county but these show excellent prospects.

### Plow and Pull

## McMillan-Graffen Nurseries

### Topnotch Orange and Lemon Trees

Selected buds, fine roots, guaranteed workmanship. Don't think of buying until you price our stock. Address Puente or Spadra, Cal.

100,000 big sour orange seedlings 10 inches and up.

To keep thoroughly posted subscribers should read every advertisement in the California Cultivator columns.

Peaches show a full crop of most varieties set, and prospects are very good. There was 20 per cent loss by frost in a few low sections.

Almonds show very little frost injury, prospects good.

Cherries show no frost injury, and expect full crop if we have no frost in near future.

Plums show some varieties set heavy and some light, but the prospects are generally fair.

Grapes show considerable frost injury in lower sections.

O. E. Bremner, Horticultural Commissioner Sonoma County

You are a few weeks too soon to give exact data. The blooming period of Sonoma County fruits is about 20 days later than last year. Whether or not this is going to work out advantageously for the crops, we are unable to say at the present time. However, everything looks propitious for a good year.

We cannot expect a heavy apple crop this year, as last year was above normal. Prunes had a lighter bloom than last year but seem to be setting almost as well. Would not be surprised if we had as good a crop as last year. Pears seem to be a little below last year's condition, and it is altogether too early to say anything about grapes, as they have not budded out yet.

Taking it all in all I would say that we are going to have a good average year.

Sutter County Farmer, Yuba City, Sutter County

Apricots 90 per cent, peaches 85, almonds 60, cherries 90, prunes 95.

Aratus Everett, Moorpark, Ventura County

Apricots are the only fruit we raise commercially in this section. They are mostly dried on the ranches. Last year we had a record crop and this year promises a heavier crop than last season. This is very unusual as we irrigate but few of the orchards and after a heavy crop year the following crop is generally light. My old apricot orchard of 125 acres, 22 years old, mostly of Royals, bore last year about 1000 tons of green apricots and will likely have over 1000 tons this year. I hear of some dropping of blossoms and fruit but do not know how general it is. In some parts of the county there will be short crop of cots.

Thos. P. Redmayne, Horticultural Commissioner, Marin County

The season so far has been very favorable. Although the rainfall has been little more than half the normal it has been so distributed that the soil has practically absorbed it all. Comparatively there has been little frost.

Apricots in general did not bloom as heavy as last year but are setting well and at present indicate 100 per cent crop.

Peaches bloomed well. It is too early yet to determine the setting of the fruit.

Cherries and almonds are as yet very little grown in this county, but such as there are are fully up to normal.

Prunes indicate at present a full crop.

The unusually mild winter is apparently showing its effect upon apple trees by a rather abnormal advancement of leaf growth and a reduction in the amount of bloom.

Pears are looking very well, their condition being fully 100 per cent.

J. P. Dargitz, Sacramento County

It is going to be very difficult to de-

termine crop quantities in fruits early. A very heavy crop set in practically all fruits and nuts, but heavy frosts the first week in April severely damaged the same. This is very general over the Sacramento Valley, of course varying in intensity from very slight damage in some cases to total destruction in others. In most cases this fruit is only just beginning to drop and this dropping will continue even into June. In many cases almonds that seem to be growing are minus the kernel or at least it is so badly hurt that it will drop before maturity.

My conclusion is that apricots will average half a crop, peaches three-quarters to a full crop, almonds 40 per cent of a crop, cherries practically a full crop and prunes from half to full crop. Too early to be sure about prunes yet.

Chas. F. Collins, Horticultural Commissioner, Tulare County

I am still in the class which doubts the advisability of estimating fruit crops at this season of the year.

Almonds and cherries are not grown in this county in sufficient amounts to mention and apricots in only a limited degree.

Apricots and peaches cannot be

heavy as there is a comparatively light crop on the trees at the present and of course this may all drop before it sets.

Prunes are hardly past the blooming period and although they bloomed well they are dropping considerably and no one can tell when they will stop.

You do not ask for grapes but I will say that the vines generally speaking, are budding very heavily.

There was a light frost on the morning of the 7th but no damage to fruit although tender vegetables were nipped in many places. Weather at present is clear and cool.

H. M. Armitage, Horticultural Commissioner, San Diego County

Regarding estimates of the coming season's output of fruit and nuts present indications are as follows: Apricots 80 per cent, peaches 55, almonds 100, cherries 80, prunes 80.

Lack of proper attention to moisture requirements during the extremely dry fall has resulted in a poor setting of fruit buds as regards peaches. Other deciduous fruits are also affected although apparently to a lesser extent. Of course you realize that the season is yet young and that these estimates may be materially changed by future conditions.

H. J. Baade, Farm Adviser Napa County

Apricots 80 per cent, peaches 100, almonds 85, cherries 100, prunes 100. The outlook for the season is very good.

Arthur E. Beers, Horticultural Commissioner, Merced County

Apricots have not set well. There is perhaps 50 per cent of the crop.

Peaches have not set well, showing probably 80 per cent of normal crop.

Almonds are looking very well, about 90 per cent of a crop.

Cherries we do not raise in commercial quantity.

Prunes are setting well, though our bearing acreage in this county is small.

There has been no damage by frost except to a few early potatoes.

Leonard H. Day, Horticultural Commissioner, San Benito County

San Benito County shows a 100 per cent crop of apricots, peaches, almonds, cherries, and prunes.

J. C. Mertz, Santa Ana Chamber of Commerce, Orange County

Apricots will not be more than 50 per cent of a crop, peaches 65.

C. A. Baker, Piru, Ventura County

Apricots have set 100 per cent crop.

## Kills all glare—Legal everywhere Gives you 500 ft. range

**BOTH** these cars are equipped with Noviol (yellow-tint) Conaphores—*legal everywhere*. The photograph shows them as they meet at a dangerous turn on a dark country road.

The instant a driver sees the yellow-tint Noviol lights he knows that they will not blind him—and feels perfectly safe. The soft mellow light is easy on his eyes and helps him to see past the oncoming car.

**Kills all glare.** The Conaphore uses all the light, but patented corrugations control it within legal limits. Height of beam is not more than 42 inches from the road.

**Range 500 feet.** Corrugations throw a shaft of strong driving light 500 feet ahead of the car.

**Ample side light.** Cylinders fan strong rays out over the roadside. Light spreads 25 feet at each side of the car 75 feet ahead.

Manufactured by the World's Largest  
Makers of Technical Glass

**CONAPHORE**

Range 500 feet—No Glare—Pierces  
Fog and Dust

**Pierces fog and dust.** This wonderful exclusive feature of Noviol Conaphores (yellow tint) is patented.

Equip your car with Conaphores. They safeguard you, and make for the safety of others. Legal everywhere. Dimming unnecessary. Made in both Noviol and clear glass.

Easy to install. Sizes to fit all cars. Order from your dealer—if he has not received his supply, write us.

### Retail Price List (Per Pair)

SIZES	Noviol Glass	Clear Glass
3 to 6 1/2 inches inclusive	\$2.40	\$1.60
7 to 8 1/2 inches inclusive	3.50	2.50
8 3/4 to 10 inches inclusive	4.50	3.00
10 1/2 to 11 1/2 inches inclusive	6.00	4.00

Prices 25 cents more per pair west of Rocky Mountains. Sizes vary by steps of 1/2 inch above 6 1/2 inch size.

No lesser force could crank a big tractor motor fast enough to deliver a starting spark as intense as that delivered by a

## High Tension MAGNETO

Equipped With a K-W Impulse Starter.

No matter how slowly you turn your tractor motor over—even if you use a crowbar—the shaft or rotor of the magneto (held back until the firing point of the engine is reached) is driven forward at a high rate of speed by this powerful impulse starter. This produces a hot, intense starting spark even when the motor is stone cold. It absolutely prevents back firing while cranking even if the spark control is fully advanced. It guarantees an immediate start and entirely eliminates troublesome self starters, coils and batteries.

The K-W Impulse Starter, found only on K-W Magnetos, was the first impulse starter. It has stood the test of time. It is a fit team mate for K-W Magnetos whose efficiency and reliability has led 40 manufacturers to adopt them as standard equipment of 83 models of tractors.

A K-W Magneto assures a positive start—without fussing. Its reliability keeps your tractor going. Its efficiency cuts fuel cost to the bone. Insist that your new tractor be K-W equipped.

## Turn Kerosene into Power

**MOGUL** kerosene engines will be bought for many thousands of farms this year because so many farm power users finally realize that lasting engine satisfaction comes only with perfect kerosene engine design, best materials, long manufacturing experience, and prompt, dependable repair service.

Take a few profitable minutes to glance over this diagram of the patented mixer which enables Mogul engines to operate successfully on kerosene, and which can be found on no other engine. To start engine, place the dampers as indicated by A and D. Open the gasoline valve, E, which will supply gasoline from the small bowl, F, used only for starting. After the engine is started, place the dampers in the positions indicated by

B and C. Open the valve, G, and the engine will run on kerosene. When the engine is warmed up, supply a little water by opening valve, H, which is needed for the successful using of kerosene by large engines. (No water is used on the smaller size engines.)

The simplicity and effectiveness of this Mogul mixer are of tremendous importance because kerosene is the great economy engine fuel nowadays, cutting power cost in half. Kerosene economy, coupled with the known value of International Harvester machine construction, makes the Mogul the right power for all-around use on any farm. Send for our catalogue and study Mogul details, then see the Mogul engine dealer. Mogul engines are of all styles, ranging in size from 1 to 50-h. p. Write the address below for catalogue.

## Every Bag Valuable

**D**IFFICULTY in securing jute from India, combined with the fact that the present freight rate from Calcutta to American ports exceeds \$100 per ton, brings the war home to grain farmers who have been accustomed to sack their grain and are not equipped for handling it in bulk.

Jute which is used largely for grain bags has received attention by the United States food administration because, like binder twine, it is closely related to the handling of the cereal grains.

Prices Based on Jute Already Purchased

To secure the importation of enough bags for the 1918 season, the food administration made voluntary agreements February 26 with the bag makers to the following effect:

The bag manufacturers agreed to sell all standard 22 by 36 inch, 12-ounce new Calcutta and domestic wheat bags on hand or already bought or to be manufactured from jute cloth already bought, at a price not greater than 25 cents f. o. b. tidewater.

This agreement was contingent on the establishment by the food administration grain corporation of a differential in its buying basis of wheat in bags over wheat in bulk of not less than seven cents nor more than nine cents per bushel. A differential of nine cents was fixed.

The bag manufacturers agreed to sell the bags only through the normal channels of distribution, the intention being to assure producers of wheat that the bags would reach them at a price not over 25 cents per bag, f. o. b. tidewater, plus freight and distributor's normal charges.

The agreement further provided that if importations already arranged were affected by unusual increases in cost because of variations in exchange or freights or other causes, the food administrator would consider proper modifications of this maximum price.

### Bags Needed for Trenches

Although the jute supply of India is considered ample, unusually heavy demands have been made on the Cal-

cutta bag industry for sand bags to be used for lining trenches.

One English order alone is for 150,000,000 bags and the other allied nations as well as the United States are utilizing the same source of supply. This situation combined with shortage of vessels and unusual demands for shipping space has resulted in the present price of bags in America and the possibility of additional advances.

Unless the bag dealers can determine now what the shortage of bags, if any, is to be, they cannot incur the risk of more imports at present prices. The only way that this shortage can be ascertained is by the prompt placing of all orders for 1918 requirements. Bag buyers who do not book their orders while the 25 cent bags are available may have to pay from 28 to 30 cents or more. Recent quotations for importing additional bags from Calcutta, if freight space is obtainable, were about 27 to 29 cents.

In addition to ordering all new bags needed, farmers are strongly advised to prepare for use all bags which can be made serviceable and to store them where damage from weather and rodents will be reduced to a minimum. The entire matter is one from which little relief is in sight until the shipping situation is greatly improved.

### Use Bags Twice

Feed, fertilizer and cottonseed sacks are likewise valuable. As a conservation measure, mills which formerly placed no return value on sacks have signified their willingness in many cases to buy back through their dealers sacks that are in good condition and may be refilled.

Elimination of printing and advertising matter both on bags and bagging material is also urged as a means of stimulating the re-use of bags, which is vitally necessary to meet any shortage which may occur.

The food administration's studies of the bag situation and its efforts to insure a sufficient supply at reasonable prices are purely voluntary and it cannot at the present time supervise the jute industry or establish any control of prices.

## Agricultural War Council Makes Recommendations

The secretary of agriculture recently called a delegation of farmers to Washington to consult together regarding production of greater quantities of food stuffs to save America and her allies from actual famine. In other words, the committee was to be an agricultural war council. California was honored in the selection of one of these delegates, George C. Roeding of Fresno being chosen as representative of the state. This advisory committee met at Washington, being there on the anniversary of America's declaration of war. Resolutions were adopted endorsing the action of the secretary in the appointing of the committee on seed stocks and the publishing of the Seed Reporter which gives a review of conditions in the seed markets. It was urged by the committee that field inspection of seed grains be extended as far as practicable. Owing to the fact that it is impossible to purchase seeds from other countries, by reason of the war conditions, the committee urged there should be brought to the atten-

tion of all gardeners and farmers the necessity of saving seed for themselves. Other recommendations: The flax situation should receive special attention; buckwheat should be conserved; millet is a desirable crop which should be grown more; there should be an accumulation of clean alfalfa seed; the bureau of markets should be as lenient as possible in fixing the grade of wheat during the period of the war; the administration should requisition the remainder of the 1917 crop of wheat even when held by farmers; investigation should be made as to high prices of farm implements and machinery; we commend the department for placing fertilizer manufacturers under license; we endorse the attitude of the war department toward agricultural labor; women should be employed for same pay as men in every vocation which they are qualified to fill as well as men, but we do not believe women should be employed for rough heavy work on farms; we believe clerks and others employed by the government

In Washington should extend their work without reference to hours and be patriotic enough to render their services willingly during the war. In addition the advisory committee made many other recommendations, especially with reference to livestock, dairy products, poultry products, and in fact many suggestions which will be of value not only to the department but to all the country.

#### FURLOUGHS FOR AGRICULTURAL WORKERS

The provost marshal general has issued an order in which it is stated that it is the intention of the war department to make use of its authority to grant furloughs to enlisted men. It will use this authority for agricultural workers only. Blanks are now being sent out to farmers who request them. Application for furlough for a helper may be made by a farmer, which, after being sworn to, is submitted to the exemption board, which if it deems wise, endorses as follows:

"The above-named local board finds that the services of the soldier herein named are urgently needed on the farm herein described; that the said farm produces substantially more agricultural produce than is consumed by those working on the place; that the soldier can not without great difficulty be replaced thereon; that his continued absence is reasonably likely to decrease the production of the farm under that which it can reasonably be expected to produce if the soldier is returned; and that the registrant will be of value as a farm laborer."

It is then sent to the soldier, and he joins in the application by signing this statement:

"I join in the above application, and if the furlough here asked for is granted I hereby engage to utilize the time of my absence solely and completely in farming, to work earnestly and well, and that if for any reason my services cease to be urgently needed before the expiration of my furlough, to report immediately for military duty at my proper post."

#### RIVERSIDE FAIR

The Southern California Fair has come into existence to assume the place filled until recently by the Riverside County Fair. That the Riverside fair might be broader in its scope, both for exhibitors and visitors, the change was made. The Riverside fair has come to be recognized as one of the strongest agricultural fairs in the West. Its exhibits are attracted from all parts of the Southwest.

With the change in name this year new classes are being added to the agricultural department. The race purses will be larger this year than before. Cooperation is the effort of the fair management with all agencies that will build up the fair and make it stronger and better. Plans are being formulated for an exhibit of food conservation ideas. The Riverside fair has been recognized as the location for the First Southern California Duroc-Jersey Futurity. Already many entries have been made in this big futurity, the first of its kind ever held in the West.

The dates for the Southern California Fair are October 8-12.

Road work is war work. "Speeding up construction of good roads is an integral part of government war work. Efficient transportation is necessary to reduce the margin between producer and consumer."—United States Food Administration.

#### BEAN POOL CLOSES MAY 11

The directors of the California Lima Bean Growers' Association have decided to close membership in the 1918 pool on May 11. The directors issue the following statement:

The results which our association obtained through its selling of the 1917 crop grown by our members was evidently generally satisfactory for not a single member filed notice of withdrawal when opportunity was offered last January. Not only have we retained the members who participated in our 1917 pool but if our 1918 pool were to be made up only of the new members who have joined our association during the past few months our 1918 pool would then have 50 members more than the number that participated in the 1917 pool; in other words our membership has considerably more than doubled. While this condition is gratifying there are still a large number of bean growers who are not members of the association. You who are members undoubtedly know of some of your neighbors and friends who should join with you in the bean growers association. No

doubt some of them have been fully intending to join the association for the coming year but have simply been putting it off. Will you explain to them that the 1918 pool closes on May 11th and extend to them another invitation to join our organization of which they know they should be a part?

#### URGES FARMERS NOT TO HARVEST WHEAT FOR HAY

A special appeal to all farmers and ranchers who have wheat lands not to cut their wheat for hay, but to allow it to mature for grain has been issued by Ralph P. Merritt, federal food administrator. Mr. Merritt pointed out the urgent necessity for wheat, declaring that the government soon will require every grain that can be grown this year to feed its armies and the armies and civilian populations of the allies.

Mr. Merritt's request, it was said, followed information that hundreds of acres of wheat in the central section of the state were to be cut for hay.

That idle acre is a German missile for an American heart.

#### COYOTE PROOF FENCE

A fence constructed in such a way as to be proof against dogs and coyotes has been designed and tried out by the forest service.

Specifications: Posts 7½ feet in length, set 2½ feet in the ground and 16 feet apart; a barbed wire stretched flat to the surface of the ground; three inches higher a 36-inch woven wire fence having a four-inch triangular mesh; five inches higher a barbed wire; six inches higher a second barbed wire; seven inches above this a third barbed wire. Total height, 57 inches.

It is essential that the bottom barbed wire be stretched flat on the surface of the ground at all points. This is accomplished by grading the ground before the fence is built and by filling in the small holes afterwards.

Production of corn, rice and potatoes in Japan during 1917 was in all cases less than in 1916. The 1917 rice crop was about 100,000,000 bushels below normal, a decline of more than one-fifth.

"The Car of No Regrets"

# KING "8"

## The Car-Owning Farmer Serves the Nation Best

HE conserves time and energy to devote to his farm by putting the automobile to work. It does the "going to town", keeping the horses in the fields. It can be driven by women and children with safety, saving time for the men. Driving it hard does no harm, it's always fresh for the next job. And if it's a King it needs little attention or repair.

This year it is a duty to buy more carefully than ever before. For reasons of economy and assured performance you should select a pioneer car of matured mechanical design and moderate up-keep, built by a reliable and long-established Company. Investigate the KING!—and because of limited "war-year" output and freight embargoes, order early.

This sixty horse-power King is now in its third year of world-wide service, following a smaller "Eight" and a successful "Four". The chassis is designed throughout for utmost simplicity and surplus strength. Comparative light weight for a car of this power and size is the big factor in its low cost of maintenance. The King has long

body room because of compact engine, and its 120 inch wheelbase gives a short turning radius, which together with its fine taper roller bearings and easily reached and operated levers, make it remarkably simple to handle. Women especially appreciate its easy driving qualities. Built low it holds to the ground at high speed. Long cantilever springs and deep, correctly tilted upholstery banish riding fatigue.

The car shown above is the seven-passenger Touring model. FOURSOME—is the King 4-passenger sport model and considered by many the handsomest of its type. A 7-passenger Sedan, richly finished, is the popular closed model.

## OUR ADVERTISERS RELIABLE

We guarantee our subscribers against  
 loss through dishonesty of any adver-  
 tisers in the Cultivator. We do not at-  
 tempt, however, to adjust trifling differ-  
 ences between subscribers and honest,  
 responsible advertisers, nor will we pay  
 the debts of honest bankrupts. Notice  
 of complaint must be sent us within 30  
 days from date of the transaction, and  
 the subscribers must have mentioned the  
 Cultivator when writing the advertiser.

## THIS WEEK'S COVER

It's different this week, that is,  
 the illustrations appear later in the  
 paper, and the place of the cover illus-  
 tration is given to a concise statement  
 as to the beginnings of the tractor  
 epoch. The next two pages are also  
 different. The one usually occupied  
 by advertising gives its entire space  
 this week to accounts of the tractor  
 demonstration and illustrations of it.

## TAXES

Taxes are due; they will soon  
 be overdue. Therein lies a penalty.  
 Save every penny of penalty this year  
 and put it in Liberty Bonds.

## W. S. S.

With all the getting of Liber-  
 ty Bonds, don't forget the humble lit-  
 tle thrift stamp and an occasional war  
 savings stamp. The aggregate of  
 these tiny bonds is to reach the sum  
 of \$2,000,000,000 before December 31,  
 and these \$2,000,000,000 will come  
 largely from the kiddies of the land.  
 Encourage them to earn and save  
 through the thrift and war stamps.

## GREAT CROPS

Much has been asked of Cali-  
 fornia; much will be given by her  
 food crops. We asked for more rains  
 than we got, but still they were suf-  
 ficient in almost every section. A trip  
 up through the Great Valley impres-  
 ses with the wealth of this state, es-  
 pecially along the river bottom lands  
 the crop of cereals this year promises  
 to be immense. In some sections the  
 hay and grains are already so heavy  
 as to be lodging. Tractors dot the  
 landscape from almost every view-  
 point, and corn, milo and beans are  
 being planted everywhere. Califor-  
 nia will feed herself this year and  
 have abundance for sending into  
 France.

## LIBERTY DAY

The president is appealing to  
 every governor and, in fact, to every  
 American to observe Friday of this  
 week as Liberty Day, the day to be  
 the beginning of the end of the Third  
 Liberty Loan drive, and it is antici-  
 pated that on that day hundreds of  
 millions of dollars will be subscribed.  
 The campaign will in reality end one  
 week later, and it is hoped no section  
 of the United States will allow any  
 portion of its quota to go by default.

## HOOVER SAYS

"The government looks with  
 disfavor upon resales within the trade  
 without reasonable justification, espe-  
 cially if such sales tend to result in  
 a higher price to the retailer or to the  
 consumer. The general principle is  
 that food commodities should not bear  
 more than one wholesale profit nor  
 one brokerage profit. When the re-  
 sale is made through a broker his po-  
 sition is similar to that of the two  
 dealers concerned, and he must be  
 prepared to prove that the sale has  
 justification and does not increase the  
 price to retailers or consumers."

It's taken the world a long time to  
 learn this lesson. We hope that when  
 the war is over it will take a far  
 longer time to forget it.

## BIG FRUIT YEAR

California has been visited by  
 streaks of abnormal weather, and  
 promising crops have been destroyed  
 or greatly lowered in quality so that  
 the producer has no absolute guar-  
 antee that nature will be kind all  
 through the season, but we are all  
 hoping that the early season's  
 promise is to be fulfilled this year.  
 The Cultivator's requests to nearly  
 all portions of California for esti-  
 mates have resulted in most hopeful  
 word regarding the season's output.  
 Every extra pound of California  
 fruits which will be produced this  
 year will aid in the fight in France:

Cereals promise big. Last year's  
 hundred per cent increase in the out-  
 put of beans will apparently be far  
 distanced this year. New canneries  
 have been built, and more vegetables,  
 tomatoes, and all fruits will be sent  
 out in tins than ever before.

## CONSIDER THE TRACTOR

The tractor is given prominence  
 in this issue of the Cultivator. This is  
 partly because of the demonstration  
 held at Davis. It was a really, truly  
 demonstration of tractor worth and  
 will result in extension of tractor use-  
 fulness. There were thousands of in-  
 quiring farmers. They have been  
 made inquirers because of the present  
 world demand for more food, because  
 of the labor situation, and perhaps  
 more by the efficiency which the trac-  
 tor has shown in the hands of practi-  
 cal farmers. One of these practical  
 men, and one of the most keen ob-  
 servers, supplements the demonstra-  
 tion articles in this issue with a few  
 items from his experience. J. B. Neff  
 has practiced farming from almost ev-  
 ery angle in many parts of California.  
 In more recent years he has grown  
 walnuts and alfalfa in Orange Coun-  
 ty. Both have been grown with prof-  
 it, but during the past year or more  
 the cost of horse feed has mounted  
 until he had turned to gas. Like every  
 other tractor purchaser he has had  
 difficulties. Account of these, to-  
 gether with that of some of his suc-  
 cesses, makes one of the most inter-  
 esting articles the Cultivator has  
 used for a long time. Read Mr. Neff's  
 experience on second page of this is-  
 sue.

## UNIVERSITY FARM PICNIC

California's Most Popular Event Given  
 Record Breaking Attendance. Per-  
 fect Weather. Great Parade.

E—the editorial we—have had  
 our first look in at the Uni-  
 versity Farm Picnic. It was  
 certainly a great gathering.  
 The weather was perfect;  
 the demonstrations and floats; the  
 decorations; the music, all were in-  
 spiring and instructive. From the up-  
 per windows of the administration  
 building the outlook over the sea of  
 moving people and of parked automo-  
 biles was one long to be remembered.  
 It is said there were 18,000 people on  
 the grounds; it looked a million, and  
 when one made the effort to break  
 away in order to make a train it  
 seemed almost impossible to get  
 loose from the crowd.

Preceding the parade and the gen-  
 eral exercises of the afternoon there  
 were sports on the athletic grounds,  
 swimming events in the big irrigation  
 tank, high school judging contests,  
 and, best of all, demonstrations in the  
 various departments where profes-  
 sors and experts of the farm school  
 staff gave of their time and talent to  
 everyone who inquired. For instance,  
 in the horticultural building in the de-  
 partment of botany Prof. Pope had  
 literally hundreds of California wild  
 flowers and specimens named and  
 told of their habit of growth and use-  
 fulness or otherwise. And amongst  
 other demonstrations were: in the  
 laboratory Prof. Beckett on measur-  
 ing irrigation water; Prof. Fossfeder  
 discussed with every inquirer as to  
 the control of mildew in vineyards  
 and gardens; hog cholera vaccination  
 was explained and demonstrated in  
 the veterinary building by Dr. H.  
 Hayes; even chicken pox vaccination  
 was conducted by Dr. Beach.

Then in the shops — to many the  
 most interesting of all—exhibits were  
 made. There were not only plows of  
 disks and plows of mold boards, but  
 many different types of moldboards  
 were shown. Profs. Davidson and  
 Fletcher had a whole battery of gas  
 engines of various types in operation  
 and literally thousands of various  
 parts of gas engines for fullest expla-  
 nation of exact construction and ma-  
 nipulation.

There were tests of spray nozzles,  
 lantern slide lectures on poultry rais-  
 ing, Dougherty; insecticides, fungi-  
 cides and poisons, de Ong; manufact-  
 ure of cheese, butter and ice cream,  
 Roadhouse; and in the auditorium a  
 special women's entertainment by  
 large choral society, moving pictures,  
 string quartets, even to instruction  
 in knitting for the Red Cross. The day  
 ended with dancing in the great din-  
 ing hall on the farm and in the audi-  
 torium.

The parade is worthy of an article,  
 which it cannot possibly have this  
 week. A few points by another Culti-  
 vator contributor follow:

By W. D. Johnston

A perfect day, a grand parade, and  
 interesting demonstrations made the  
 day a success beyond comparison.  
 The parade of 14 floats and 60 head of  
 pure bred live stock was the feature  
 of the day. The floats, which repre-  
 sented every division on the farm,  
 were drawn by the tractors which  
 participated in the tractor demonstra-  
 tion.

The auction sale held for the bene-  
 fit of the Red Cross netted that so-  
 ciety \$1487. The Holstein bull calf  
 donated by A. W. Morris & Sons of  
 Woodland, was sold to S. Lawson of  
 Woodland for \$490.

The division of agricultural engi-  
 neering was visited by more specta-  
 tors than any other department. Here  
 were demonstrations in silo construc-  
 tion, gas engine adjustment and re-  
 pair and tractor lubrication.

The horticulture department con-  
 ducted tests of spray nozzles, methods  
 of grafting and pruning trees, and the  
 preparation of home-made lime sul-  
 phur solution.

The veterinary building was the  
 scene of demonstrations in hog chol-  
 era and chicken pox vaccination.

The poultry department conducted  
 a lantern slide lecture on, "War Time  
 Poultry Raising on the Farm and in  
 City Back Yards."

## This Week's War Notes

Britain is appealing; "Send army  
 faster; we have no more reserves.

Italian troops have been sent to  
 France to aid in holding back the  
 Hun drive.

The four years of war have cost  
 France 2,600,000 men in killed, wound-  
 ed and taken prisoner.

Britain's debt now aggregates \$40-  
 000,000,000, but it is still able to ad-  
 vance vast sums to its allies.

The German-American Alliance in  
 California has decided to disband and  
 turn over its entire assets to the Red  
 Cross.

Hearst has announced that he will  
 suspend publication of his New York  
 Journal published in the German lan-  
 guage.

At the trial of the Hindu conspiracy  
 case in San Francisco one Hindu kills  
 another and in turn is shot by deputy  
 sheriff.

Holland is endeavoring to remain  
 neutral but fears that Germany may  
 march troops across her country with-  
 out a moment's notice.

An internal explosion destroyed the  
 steamer Florence H. in a French port.  
 She was an American owned 5000 ton  
 steamer and several Americans were  
 killed.

The American steamship Lake  
 Moor, making her maiden voyage, was  
 sunk by submarine in European wa-  
 ters April 11. Five officers, 91 men  
 missing.

There is opposition to the effort to  
 raise the draft age to 40 years, espe-  
 cially from the war department. Sec-  
 retary Baker says young men are  
 needed to fight this war.

Railway communication between  
 Finland and Russia has been cut. Vi-  
 borg is still in the hands of the Red  
 Guard. German troops are in control  
 of much of the territory.

Holland seems approaching her  
 crisis. Her army of 2,000,000 is mob-  
 ilized and it is reported she is pre-  
 pared to resist any encroachment on  
 the part of the Teuton army.

One more week of Liberty Loan  
 with nearly half of the \$3,000,000,000  
 yet to raise. St. Louis and Minne-  
 apolis districts have exceeded their  
 quota by over \$100,000,000 each.

American troops are occupying a  
 greater proportion of the trenches,  
 which they are holding against every  
 attack of German troops. The Sam-  
 mies have made successful counter  
 attacks and returned with Hun  
 prisoners.

The latest to declare war is Guate-  
 mala. She broke off diplomatic rela-  
 tions with Germany in April, 1917.  
 Now her national assembly declares:  
 "The republic of Guatemala occupies  
 the same position toward European  
 belligerents as does the United States.

The battle line in France and Bel-  
 gium has changed but little within  
 the past few days. Germany appears  
 to be massing for another terrific  
 drive. Meantime the Allies are  
 strengthening positions and occasion-  
 ally making slight advance to secure  
 more advantageous footing.

The English navy Hobsonized the  
 harbors of Zeebrugge and Ostend by  
 sinking in each two cement laden out-  
 of-date cruisers across the necks of  
 the harbors. In addition a dynamite  
 loaded submarine was floated inside  
 the dock gate at Zeebrugge and ex-  
 ploded, and it is reported that the  
 waters of Bruges canal are escaping.  
 The English officer who planned the  
 raid, and many of the crews were  
 killed.

# Agricultural News Notes of the Pacific Coast

## Northern California

Lake County pear producers are spraying for scab.

Butte County has adopted the wheat saving card.

Annual Rice Festival will be held at Madison, Yolo County.

J. E. Stiles has been appointed farm adviser of Sutter County.

Bowman Center, Placer County, will hold a farm picnic May 4.

"A pig or two on every ranch" is the slogan in Napa County.

Eldorado County dairymen are building more generally of silos.

Bulk moving of grain is assured at many of the larger grain shipping points.

The alfalfa mill at Woodland, Yolo County, will begin operation about May 15.

County farm advisers are mixing vast quantities of squirrel poison for distribution on squirrel week.

Tractor demonstration near Davis called out attendance variously estimated at from 30,000 to 50,000.

California Prune and Apricot Growers' Association will hold a meeting at Chico Saturday of this week.

Yolo County's rice production last year was about 12,000 acres. There will be material increase this year.

Dunnigan farm bureau center of Yolo County recently met and discussed grain sorghums and more pork.

Butte County farmers are conferring on the labor question. There will be in that county a shortage of about 500 men.

The Nuestro Farmers' Protective League has changed its organization to a farm center and will affiliate with the farm bureau.

Olive mills near Oroville have been notified that it is probable there will be an embargo on the importation of olive oil into the United States.

## Central California

Eastern Kings County's rabbit drive netted 500.

Turlock will plant nearly 35,000 acres of beans.

Kerman pear growers are cutting blight from the pear orchards as fast as it appears.

Oakdale, Stanislaus County, began rural service from its post office April 16.

Kern County plans for the building of a cotton gin at Bakersfield. It will cost about \$15,000.

Tulare County exported \$10,000,000 more worth of products last year than the year preceding.

Tulare County's orange bloom is slower than usual, but promises to be a wonder when fully out.

Alfalfa growers at Raisin City are organizing to affiliate with the State Alfalfa Growers' Association.

Cling peach growers of the state met in Fresno April 20. They assert they cannot deliver clings at \$25 per ton.

The \$4.10 price for rice is giving a boost to rice production in the Oakdale irrigation district. That district will plant 1500 acres.

State Horticultural Commissioner Hecke calls for relief from the squirrel tail deluge. It will be impracticable to store all these squirrels in Sacramento.

At the annual meeting of the California Dairymen's Association held at Oakland, Stanislaus County had six times as many representatives as any other county.

A canvass is being made of the peach growing sections of Tulare County as to output for the coming season. The county association recently met at Visalia.

A conference of wine grape growers held at Fresno endorsed the Rominger bill and will campaign for it. Members have adopted the slogan; "The saloon must go."

## Southern California

Brawley will ship 15 carloads of strawberries.

Victorville, San Bernardino County, is proud of its honor flag.

Coachella Valley is shipping large quantities of strawberries.

Imperial County has 520 acres planted to Bermuda onions; Riverside County, 892.

The first work of the cannery at Arlington, Riverside County, will be on sourcroust.

Riverside has nearly finished its Navel output, and total shipments to date aggregate about 700 cars.

Many local railway trains out of Los Angeles have been taken off so as to give more efficient military service.

Manager Churchill of the Lima Bean Growers' Association is in the East looking after the marketing of next season's crop.

The Irvine Company, with immense holdings in Orange and San Diego Counties, will plant 25,000 acres of beans this year.

A new association of apple and deciduous fruit growers has been formed in the Yucaipa Valley of San Bernardino County. It will be capitalized at \$100,000.

The Coachella Valley farm center met recently and discussed summer irrigation and cultivation, especially of beans. This was the annual meeting with election of officers.

Farm Adviser Sprague of Orange County is making strong appeal for greater interest in farm center meetings and in taking part in the campaign of "Food for the boys over there."

An important meeting of date growers was held at the experiment station at Indio last Saturday. Prof. Drummond gave a lecture and demonstration on cutting offshoots; also on pollenization.

## The Coast and General

A sugar factory is being built at Ashton, Idaho.

Food Administrator Hoover has ruled that no dried fruits may be sold before May 1.

Klickitat County, Washington, is building a highway from the interior to the Columbia River.

Sugar beet fields of Yakima, Washington, have secured 600 workers from the Montana fields.

Stockyards at various packing centers report receipts of hogs in 1918 as greatly in excess of those of 1917.

Chehalis, Washington, has served notice on loafers to get busy and aid farmers in planting or leave the city.

Investigations made at Washington in regard to "glass in food" show that but one case out of 200 has disclosed glass.

Garfield County, Washington, farmers are paying \$60 per calendar month, or \$3.50 per day and board for farm helpers.

Owing to introduction of many tractors, Harrisburg, Linn County, Oregon, is offering large numbers of draft horses for sale.

The dairy inspector of Idaho has declared war on the sale of impure and injurious substitutes for dairy or other foods under the plea of war saving.

The largest woolen mill west of the Atlantic Coast is in Portland, Oregon. It is using two and a half million pounds of wool annually, and employs 450 men.

Australia has 150,000,000 bushels of wheat surplus. It is suggested that as much of this as possible be sent to America to make up for shortage in supplies to Europe.

Milk condenseries in Oregon maintain that dairymen of that state had graded up their cows so as to produce too rich a milk for them to buy and make a profit in condensing.

*Come to Stanislaus County for Registered Holsteins*

**STANISLAUS COUNTY LEADS**

All counties of California in number of herds of registered Holsteins and number of 30 pound sires in service.

### I Will Sell

my milking herd of registered Holsteins in North San Joaquin Breeders' First Consignment Sale at Modesto on May 9. Interested parties are invited to come and see the herd before sale day.

**J. W. Benoit**

Route C Box 183, Modesto, Cal.

### White House Holsteins

A well bred proven herd sire for sale, also a few bull calves.

A. M. Gibens, Rt. 1, Box 307, Modesto, Cal.

### Thompson's Registered Holsteins

Young bull calves for sale with yearly record backing.

Luther Thompson, Rt. A, Box 351, Modesto, Cal.

## Creamcup Holsteins

Burke. A few young bulls for sale.

Headed by the 33.92 pound bull Creamcup Champion Pontiac

M. HOLDRIDGE, Rt. B, Box 366, Modesto, Cal.

### Pelandale Holsteins

Headed by Hazelwood Mercedes Posch Ormsby. Good young bulls and a few registered cows for sale.

J. A. Pelanda, Rt. B, Modesto, Cal.

### Segis Pontiac De Kol Dutch

Whose three nearest dams are 1000 pound cows that average over 30 pounds in 7 days, heads my herd. Bull calves for sale. E. E. Freeman, Rt. B, Modesto

### Registered Holsteins

Young sons of Prince Hiske Walker out of A. R. O. dams for sale.

H. E. Cornwell, Rt. B, Box 183, Modesto, Cal.

### HOLMES STOCK FARM

Registered Holsteins of best breeding. Young bulls for sale.

R. L. Holmes Modesto, Cal.

Let us Tell You All About

**KIMBALLS  
Direct Flow Turbine**

**Save Digging Pits and Large Wells**

The Kimball Direct Flow Turbine is a moderate speed rotative pump employing an improved design of Impeller and Rectifier not embodied in any other pump. This, coupled with low velocity, reduces the friction to a minimum thus saving horsepower and reducing wear. All bearings are lubricated through a hollow shafting by a positive lubricating system. These bearings are protected by automatic water tight packing glands to prevent sand entering.

**Look at This!**

A Kimball Direct Flow Turbine will pump:

40 miners inches out of a 7 inch well.  
115 miners inches out of a 10 inch well.  
200 miners inches out of a 12 inch well.

Write us your irrigation requirements. NO CHARGE FOR ESTIMATES.

Our many years of experience in irrigating systems places us in a position to help you save money if you will give us an opportunity.

# The Flea-Beetle, A Pest of Tomatoes and Potatoes

By F. H. Chittenden

**T**OMATO seed beds in many  
sections are being injured by  
a species of flea-beetle.  
These insects, a little larger  
than a flea, derive their com-  
mon name from their small size and  
from the fact that their powerful hind  
legs enable them to take long leaps.

Prompt remedial measures should  
be undertaken, especially in the case  
of infested seed beds.

Potatoes are attacked every year by  
flea-beetles, some of which are spe-  
cific enemies of the crops of the  
potato family. Flea-beetles begin their  
work early in the season. The beetles  
riddle the leaves of young and tender  
plants with punctures, causing the  
leaves to die, thus depleting the vi-  
tality of the plant, and the larvae, or  
young, feed at and injure the roots.

The most important of these insects  
is the potato flea-beetle. This species  
occurs practically throughout the po-  
tato-growing regions of the country  
from Canada and New England to the  
Gulf region, and in some districts in  
California. The most severe injury,  
however, is done in the North. The  
larva is a cause of "pimply" potatoes,  
which bring a lower price in the  
market, sometimes five cents a bushel  
less than the regular price. Egg plant,  
tomato and tobacco also are attacked,  
and when this insect is numerous it  
sometimes attacks other plants. Oc-  
casional injury is done to potatoes  
and tomatoes through gnawing of the  
sprouts. Eggs are laid early in May  
or June, and the life cycle may be  
completed in midsummer in about 35  
days.

During recent years this species  
has shown a great fondness for  
tomato, and during the spring and  
summer of 1917, from April 19 to  
about the middle of July, injury was  
widespread. In the case of tomato,  
the plants were sometimes destroyed  
by defoliation when potatoes also were  
present. The aggregate of attack  
shows injury about equal on these  
two crops. Attack was so sudden and  
severe that no remedies were applied  
so far as could be learned.

The egg plant flea-beetle and the

tobacco flea-beetle also attack potato,  
but each is more common on the plant  
from which its English name is de-  
rived.

## Remedies for Flea-Beetles on Potato

When potatoes are sprayed with ar-  
senate of lead for the Colorado potato  
beetle and with Bordeaux mixture for  
diseases, these beetles are repelled to  
a considerable extent. Because of  
their active jumping and flying habits  
these insects are not likely to remain  
on the plants during spraying, and so  
are not poisoned, but they do not seem  
to attack foliage that has been cov-  
ered properly with either spray ma-  
terial.

Although the subject of experiment  
for many years, the most efficient rem-  
edy for the potato flea-beetle remains  
to be found. The general opinion  
seems to be, however, that Bordeaux  
mixture alone, acting as a repellent,  
is the best. This spray to be effective  
must cover both sides of the leaf. In  
a week or ten days or when the ma-  
terial is worn off application should  
be repeated.

All wild plants of the potato family  
should be pulled up or otherwise de-  
stroyed throughout the season in  
order that the insects may have no  
other breeding place.

Bordeaux mixture can be purchased  
in convenient package form from  
dealers or prepared at home from  
bluestone (copper sulphate) which  
costs 10 to 25 cents per pound, and  
fresh stone or lump lime (quicklime):

Bluestone, 4 ounces; quicklime, 4  
ounces; water, 12 quarts; or blue-  
stone, 4 pounds; quicklime, 4 pounds;  
water, 50 gallons.

Dissolve the bluestone in a wooden  
or earthenware vessel, using hot  
water. Dilute with half the water.  
Do not use tin or other metal con-  
tainers as they would be spoiled.  
Slake the lime by adding water, a lit-  
tle at a time. When reduced to a  
milky fluid, dilute with the rest of  
the water and strain through doubled  
cheesecloth or a brass wire strainer  
of 18 meshes per inch and pour into  
it the bluestone solution. Stir well  
and apply at once. This is best when  
prepared fresh for each using.

# Weekly Report on Truck Crops

**C**ONDITION of truck crops  
for the week ending April  
13, 1918 is reported to the bu-  
reau of crop estimates,  
United States department of  
agriculture, by telegraph by assistant  
truck crop specialists in California.

## Southern California

Cabbage shipments continue light,  
but will increase next week. Quality  
is improving gradually. The heaviest  
output is expected in May. A special  
reporter in Orange County states the  
crop yielding four to five tons per  
acre of shipping stock, being reduced  
at least 25 per cent by seeders.  
Sixty to 75 cars are expected to move  
during the week.

Potato planting continues actively,  
and actual acreage figures from all  
districts are not yet available. A spe-  
cial reporter estimates the total area  
in Southern California at 12,000,  
which is somewhat heavier than  
usual, but 20 per cent less than last  
year. Only 200 acres are expected to  
be ready in May, the bulk of the crop  
coming on in July. Late planting and

poor seed may shorten the yield and  
total shipments are not likely to ex-  
ceed 1700 cars.

Lettuce shipments from Imperial  
Valley have stopped for the season  
and shipments from the Los Angeles  
district are very light. There are no  
immediate prospects for good sup-  
plies of desirable shipping stock.

Strawberry shipments from Imper-  
ial Valley are at their height, amount-  
ing to 350 trays in one day. Los An-  
geles County made a very light first  
bloom and a special reporter esti-  
mates the crop at 50 per cent or 60  
per cent of normal, with heavy ship-  
ments commencing the 20th of the  
month. Other reports indicate that it  
is doubtful whether any car lots will  
be shipped this year.

Bermuda onion situation is report-  
ed unchanged, except that thrips  
has reduced early estimates of yields  
and arrangements are under way for  
standardizing the pack. April 22 is  
set for the date for shipping the  
first car.

Correspondence with the advertisers in the Califor-  
nia Cultivator will convince you that their articles  
will save you money.

cool weather. Crop prospects are favorable, but probably car lots will not roll prior to May 1 and possibly later.

The condition of truck crops is estimated as follows: Asparagus 89 per cent; cabbage 65 per cent, cantaloupes 92 per cent, cucumbers 89 per cent, lettuce 62 per cent, onions 72 per cent, potatoes 85 per cent, strawberries 75 per cent, tomatoes 85 per cent, watermelons 90 per cent.

#### Central California

Early potatoes were not reported frosted in the Bay region, but were injured in parts of the Sacramento Valley. Acreage is generally reduced except in the Colma district, where Garnets are grown. Prospects are for a good crop in this section.

Asparagus has not yet come on in great quantities. A portion of the distributors have discontinued Eastern shipments for the season. Their output was about 20 per cent of the volume they had counted on. Labor shortage during the rush period will probably cause heavy losses of the product.

Cabbage shipping from the Bay district is practically finished, except the spring crop, which is not in general demand for shipping. Sacramento cabbage is growing well, but field inspection did not show the quality of the Early York to be very good. Demand for canning and evaporating may reduce the supply for shipping.

Celery. It is estimated by a special reporter that the prospective acreage of celery for this part of the state is 2180 acres, which represents about 55 per cent of last year's acreage.

Strawberries are now being picked, but heavy shipments are not expected until next month. A special reporter in Alameda County estimates the crop at 20 per cent below normal. The condition of foliage is poor, but no serious frost damage has been done.

Onions. The early crop is making an excellent growth, but frost damage to the young plants of the main crop looked very serious at first. Later indications are that the crop is recovering to a large extent. A few fields were plowed up.

Onion seed crops were not seriously affected, although personal inspection showed slight tip injury in certain fields. A special reporter estimates the acreage of onions growing for seed at 10,000 acres, or more than double last year's planting.

Beet seed crops were injured by frost in many fields, but the damage is not considered serious. The proportionate increase on beet seed is larger than for any other seed crop.

Carrot seed crops are doing well, and also show a big increase in area. A large crop of spinach grown between the rows has perhaps reduced the productive capacity of certain fields.

Spinach has been maturing faster than local canneries could handle it, and distant plants have been taking the surplus. Yields are running six tons and upwards and indications are that the pack will amount to 300,000 cases.

Cantaloupes are coming up rapidly. Reports agree that San Joaquin Valley will have 3000 acres, or upwards. Cars are expected the first half of July.

The condition of truck crops is estimated as follows: Asparagus 85 per cent, artichokes 70 per cent, cabbage 90 per cent, lettuce 75 per cent, onions 80 per cent, peas 88 per cent, potatoes 70 per cent, spinach 98 per cent, strawberries 85 per cent.

#### VEGETABLE SHIPMENTS

We have word from Chairman W. Q. Wright of the California Vegetable Growers' committee in effect that the unfortunate condition in vegetable shipping has now been corrected and presumably the work of the committee is finished. Committeeman Thomas O'Neill, who took the matter up with railroad executives at Washington, New York and Chicago, wires under date of April 12:

"As a result of conferences with railroad executives at Washington, New York and Chicago, definite schedules are now in effect covering the eastbound movement of California perishables on the basis requested by your committee, i. e., 9 days to Chicago, 14 days to New York, 15 days to Boston, and corresponding schedules to intermediate points. The details of these schedules, as far as Western lines are concerned, were finally approved by traffic and operating officials here today, and copies of these will be furnished us when issued."

He adds that much credit is due to Traffic Director Chambers of the United States railroad administration because of his uniting in effort with the committee to save the California vegetable industry.

#### SPINACH

Spinach cultivation will be carried on much more extensively in California in the future, according to a bulletin just issued by Stanley S. Rogers of the University of California. This will be due to the great demand for this crop for canning purposes.

"Spinach is well adapted to a large area in California," Professor Rogers continues, "and may be grown where ever the conditions are favorable for the production of vegetables. Under normal conditions when growing spinach in large tracts, the cost varies from \$25 to \$35 per acre, exclusive of land values of fertilizers. The yield per acre varies from three to five tons, with an average production of four tons. When selling to the cannery the customary price is \$25 per ton. On the fresh market the grower will usually receive from three cents to five cents per pound, unless the demand is oversupplied."

"Spinach is best adapted to a rich, light loam and is not a satisfactory crop to grow on soils of poor quality or those which will not retain moisture well. The climatic requirements of this crop are very exacting. The plants will stand without injury a relatively low degree of temperature but are seriously injured by heat. Planting early in the fall and late in the spring should be avoided since the plants will not make a satisfactory growth during hot weather. When planting during the rainy season, provided the soil is of a sandy nature and is free from weeds so that it will not pack wet, this crop may require no cultivation. The crop is ready to harvest in six weeks to three months after planting."

Professor Rogers' article, entitled "Spinach Growing in California," may be obtained by writing to the University of California College of Agriculture, Berkeley.

The soldier and the farmer are eager to do their full share. Both incur risks. Very many civilians are equally eager to do their share but may not appreciate the opportunity to serve in the field of agriculture.—Secretary of Agriculture.

QUICK AND ECONOMICAL TRANSPORTATION

## Nash Trucks Shorten Your Trips

Nash trucks, replacing teams, double your loads to the creamery and cut the time of the trip in half. Powerful and dependable, they haul your loads at lowest cost and in the shortest possible time.

They have many superior mechanical features which make them unusually adapted to this service. Equipped with M. & S. automatic locking differentials, they get through where other trucks without this important feature cannot go.

The Nash truck's driving wheels cannot spin. This saves fuel and tires. It lets Nash trucks keep going on muddy and slippery roads.

The strong, internal gear drive axle of Nash trucks is simpler and lighter than others and delivers more power to the driving wheels, especially at low engine speeds.

Unusually long springs, protecting the truck's load from the bumps of the road, and an electric starting and lighting equipment are among the other Nash features our transportation expert will be glad to explain to you in detail.

## Breed Leaders

Every breed of livestock has its outstanding character the same as the human kind. A great dairy cow has proved her ability to produce anywhere up to 15 tons of milk annually; the trotting horse has secured his record around two minutes; the beefmaker has shown his ability to make the least amount of feed into the greatest amount of food; swine, sheep and others of the livestock family have shown themselves great characters. In addition—and here is where their worth is proven—these animals can transmit their productive power to their offspring.

Beginning with the issue of August 4 the Cultivator gave an account of Pietertje Bloom of the University Farm dairy herd. Some things she has done and more that her daughters have done were chronicled. She was a most worthy leader in this series of articles. Others of her kind follow. More of the "handsome is as handsome does" type of animals will be given in the columns of the Cultivator during the next few months.

Written for California Cultivator By C. A. Briggs

### WINNIE KORNDYKE CORNUCOPIA

**W**INNIE Korndyke Cornucopia DeKol 101449, owned by the J. S. Gibson Company of Williams, is of the blood royal and a royal performer at the pail. She was born on April 18, 1907, sired by Aaggie Cornucopia

a half sister of Prince Alcartra Korndyke, the present senior herd sire of the Gibson herd. He is a son of the great Morris cow, Tilly Alcartra, the only 40 pound cow in the West.

"Winnie's" records have been many and good and but for a mistake in feeding she might well have been a

milk; ten months, 1034.4 pounds butter, 27,443.3 pounds milk, a world's record by over 400 pounds. At this time through a mistake she was fed some frosted alfalfa and fell off in her production but still finished her year's test with a record of 1201 pounds of butter and 31,034.2 pounds of milk. She is a cow of fine strong individuality and looks good to her owner and every lover of a great producing dairy cow.

### JANE GARDEN FARM DEVELOPS A 32 POUND COW

While a considerable number of very creditable records have been made by some of the registered Holsteins at Jane Garden Farm, owned by Fred W. Kiesel, Sacramento, president of California Holstein-Friesian Association, it is not until now that

ful nine year old cow, who has to her credit on official test 723.4 pounds milk and 32.58 pounds butter in seven days, and promises to make some further gains. At freshening she dropped a fine bull calf by King Korndyke Pontiac, sire of the \$6500 bull King Korndyke Pontiac 20th.

Jane Garden Farm is a delight as a farm, comprising some 500 acres of rich river bottom that is indeed garden land, every inch of it, growing seven crops of alfalfa without irrigation, enormous crops of ensilage corn, besides wondrous crops of beans, the latter crop having amounted to considerably over \$100,000 last year.

Equally pleasing is the herd of registered Holsteins with which Mr. Kiesel has populated the place. With his unusually well selected foundation females he mated the great young bull

Winnie Korndyke Cornucopia De Kol

Sita De Kol Princess

Johanna Lad 32554 out of Winnie Lamb Korndyke DeKol 78795. The sire is a son of the first 34 pound cow, and on his side as well as through her dam "Winnie" carries some of the best blood of the breed. Her dam is

world's yearly record cow. In seven days her record was 28.73 pounds butter, 789 pounds milk; 30 days, 117.2 pounds butter, 3215.4 pounds milk; 274 days after calving, seven days 22.57 pounds butter, 558.4 pounds

one of the ambitions of every newly established breeding farm—the development of a 30 pound cow—has been realized.

The member of the herd to turn the trick is Sita De Kol Princess, a beauti-

Prince Gelsche Walker Korndyke, who has developed into an individual of extraordinary merit, and his daughters, of which there are now a large number in the herd, are of very great promise, possessing in a marked de-

Miss Valley Mead De Kol Walker

gree the great capacity and fine udder development that is so characteristic of the Walker family. From these heifers there will soon be coming on a crop of calves sired by King Korn-dyke Pontiac, in fact a few have al-ready arrived and they show that this cross is one of high promise.

Mr. Kiesel also owns a half interest in Sir Aaggie De Kol Acme, son of the world's yearly official record cow Aaggie Acme of Riverside 2nd, and he is being bred to many of the best females in the herd.

From now on some good records may be looked for regularly from Jane Garden Farm, as the big herd is just about to swing into its stride.

#### MISS VALLEY MEAD DE KOL WALKER TAKEN OFF TEST

The sensational daughter of Prince Gelsche Walker, Miss Valley Mead De Kol Walker, has been taken off test in the herd of A. W. Morris & Sons, Woodland, just 30 days before she is due to calve again on April 30.

Her past accomplishments are al-most too well known to warrant re-peating again, yet in view of her latest complete record it is well to do so because of the conditions under which she has made her successive records.

She dropped her first calf as a senior two year old and made official records of 534 pounds milk and 25.68 pounds butter in seven days. Eight months after calving she made 21.33 pounds butter in seven days, which is still a world's record in class. She was continued on test and at the end of 257 days she had to her credit 17,010.9 pounds milk and 790.38 pounds butter, but was taken off test as she had been bred to calve as a junior three year old and was close to freshening date. Freshening as a junior three year old she made the great official records of 688.6 pounds milk and 36.81 pounds butter in seven days. She was again continued on yearly test but along in the middle of it was shipped over 500 miles in very hot weather and suffered con-siderably from the trip, dropping off very sharply in production. She grad-ually recovered her stride however, and in seven days eight months after calving made 25.24 pounds butter in seven days, which is a world's record in class. Continuing on she won first place over all breeds in the California Dairy Cow Competition, with a pro-duction of 819.42 pounds butterfat in ten months, equal to 1024.27 pounds butter. At the end of 335 days, within 30 days of calving, she was taken off test and had to her credit for that period 21,915.6 pounds milk and an even 1111 pounds butter, which is the second highest record ever made by a junior three year old even for a full year.

As most everyone knows, Miss Val-ley Mead De Kol Walker is the dam of W. J. Higdon's \$6500 bull King Korndyke Pontiac 20th. This year

she will drop a calf by Sir Aaggie De Kol Acme, son of the world's official yearly record butter cow Aaggie Acme of Riverside 2nd, and there is lively

speculation as to the sex of the com-ing youngster. Male or female, it will be some calf.

The only legitimate "con game" is the con-servation game.

## A Sale of Extraordinary Character

# Fourth Sacramento Sale

# 140 REGISTERED HOLSTEINS 140

## State Fair Grounds, Sacramento, Cal. June 5-6, 1918

California Holstein breeders are responding nobly to the call for only the best class of cattle in our public sales, and we go on record with the statement that this sale contains the best lot of cattle from every standpoint that has ever appeared in a California sale of equal size, and we doubt if more than one smaller sale in the state has ever equalled its quality. And these cattle are in good physical condition, many of the heavy springers will be in shape to go on test when they freshen shortly after sale date, while the large number of fresh cows and heifers in the sale will be in such condition that the buyer is assured they can go ahead for big production right from the moment of his ownership.

Here are only a part of the great females in this sale:

A 30 POUND JUNIOR FOUR YEAR OLD daughter of a 35 pound sire.

A DAUGHTER OF PRINCE GELSCHER WALKER out of a 27 pound daughter of a 32 pound cow.

A DAUGHTER OF KING KORNDYKE SADIE VALE 22ND, out of May Korndyke, for many years the youngest 30 pound cow of the breed.

TWO DAUGHTERS OF KING SEGIS

DE KOL KORNDYKE, one out of a 28

pound daughter of King Walker Segis,

the other out of a 22.95 pound grand-

daughter of Pontiac Hengerveld Par-

thena.

FOUR DAUGHTERS OF KING SEGIS

PONTIAC, one out of a daughter of the

40 pound sire Johanna McKinley Segis.

A DAUGHTER OF KING PONTIAC

MAYFLOWER out of a 21 pound dam.

A DAUGHTER OF KING PONTIAC

NETHERLAND SEGIS out of a 28

pound dam.

A GREAT GROUP OF DAUGHTERS OF

KING KORNDYKE SADIE VALE 27TH,

one of whose daughters sold for \$1400 in

the Guaranty Sale. One of these is out

of a 29 pound dam, another out of a 27

pound four year old daughter of Chang-

eling Butter Boy.

A 29.13 POUND DAUGHTER OF SIR

PONTIAC RAG APPLE KORNDYKE.

A 26.41 POUND COW and her daughter

by Sir Korndyke Pontiac Artis out of a

30 pound daughter of Sir Veeman Hen-

gerveld.

A 22.12 POUND DAUGHTER OF

PIETERTJE HENGERSVELD SEGIS,

record made at two years two months.

RIVERVIEW BRACELET BRETT, first

prize two year old at 1917 State Fair,

Fresno and San Francisco Land Show.

A 23.97 POUND FOUR YEAR OLD granddaughter of King

Segis Hengerveld.

TWO DAUGHTERS OF A 40 POUND SIRE.

A DAUGHTER OF SEGIS PONTIAC DE KOL BURKE out

of a 22.14 pound four year old.

A DAUGHTER OF A 25 POUND COW that made 770.68

pounds butter in one year, bred to a grandson of Finnerne

Pride Johanna Rue.

A DAUGHTER OF KING SEGIS PONTIAC JANNEK out of an A. R. O. two year old granddaughter of Sir Fayne Con-cordia.

A DAUGHTER OF KING SEGIS PONTIAC JANNEK out of a great 28 pound four year old and bred to the \$6500 36 pound bull, King Korndyke Pontiac 20th.

HIGHLY BRED A. R. O. COWS AND HEIFERS bred to

the great King of the Black and Whites.

TWO DAUGHTERS OF PRINCE

JULIANA DE KOL WALKER in calf to

a son of King Korndyke Sadie Vale.

A 729.6 POUND YEARLY RECORD

JUNIOR TWO YEAR OLD daughter of a

40 pound sire.

A 26 POUND COW bred to a 40 pound

bull.

A 20 POUND THREE YEAR OLD

DAUGHTER OF PRINCE GELSCHER

WALKER bred to a 40 pound bull.

A DAUGHTER OF KING KORNDYKE

PONTIAC bred to a 40 pound bull.

A HEIFER that made 620.47 pounds but-

ter in one year as a two year old, bred

to a 40 pound bull.

SOME SPLENDID HEIFERS bred to

King Mead of Riverside and Prince

Gelsche Walker.

#### BULLS

A SON OF SEGIS PONTIAC DE KOL BURKE out of a 34 pound daughter of Changeling Butter Boy and a 30 pound cow. A beautiful individual, nearly white.

TWO SONS OF KING KORNDYKE SADIE VALE 27TH, one out of a 29 pound four year old daughter of King Segis 11th, the other out of a 22 pound

three year old daughter of Changeling Butter Boy.

TWO SONS OF THE 40 POUND SIRE PRINCE ALCAR-

TRA KORNDYKE, full brothers, out of a 24 pound dam.

GREAT YOUNG SONS OF Supreme Glista Pietje, King Pon-

tiac Segis Inka, King Lillian Walker Segis, and It King of

the Pontiacs, out of well bred dams.

A SON OF THE 34 POUND SIRE KING PONTIAC

NETHERLAND SEGIS 3D, out of a 26.86 pound four year

old.

A SON OF MODEL KING SEGIS KONINGEN out of a

splendidly bred dam.

Every animal in this sale is pledged to absolute sale without reserve, limit, or by-bid, guaranteed in writing to be a breeder, has individual tuberculin test certificate and is sold subject to tuberculin re-test by the purchaser.

Disinterested breeders and authorities on type and breeding share our firm belief in a wonderful future for our great herd sire

He himself has developed into a bull of magnificent presence, but his greatness is vested in the extraordinary sons and daughters that have been dropped to his service.

His daughters show the great dairy capacity, beautiful udder development and veining, and true dairy form that is their inheritance.

His sons are straight, deep bodied, full, chested fellows that will breed quality into any herd. Wouldn't it be good business to invest in one of these youngsters for your herd sire?

We price them moderately and give terms if you wish.

## Treatment of Scours in Calves

From Address by C. V. Castle at Dairy Conference, Davis

**C**ONTAGIOUS scours and calf pneumonia have been found to be caused in many or most cases by the same germ which causes contagious abortion in cattle. Herds which have the germs of abortion in them, and many do, even if no cases of abortion are present, are the ones which suffer most from contagious scours and pneumonia. Quite commonly the calf from a cow that has aborted in the past does not show either scours or pneumonia, having perhaps become immunized from the blood of its mother. Calves from healthy mothers are very susceptible and milk from cows which have aborted or are reactors to the abortion test, is very likely to cause scours and should not be fed to young calves.

### Preventive Treatment

In preventing scours, the following practice is recommended:

Before calving place the cow in a well bedded boxstall, which has been thoroughly disinfected with Kresol or sheep dip. As soon as the calf is born disinfect the navel with iodine solution, and if the navel is not well dried up in 24 hours, put on more iodine. Before allowing the calf to suck wash the cow's tail, udder and flanks in soap and water with a disinfectant in it. As soon as the cow has had a chance to dry, off the calf see to it that it nurses well, helping it if necessary. After the calf has sucked it is well to give it an enema. This is given by means of a fountain syringe and several feet of flexible rubber tubing. Warm water containing a few drops of Lugol's iodine solution is used, and the large intestines are flushed out as clean as possible.

After the calf has sucked it may

be given three teaspoons of a stock solution of one part formaldehyde to 30 parts water in a half pint of warm water. A teaspoon of soda may be placed in the formalin solution as well.

These precautions should ensure a healthy calf but quite often scours may develop even then, especially if the infection entered the calf previous to birth.

### Curative Treatment

The first thing to do is to reduce the feed even if the calf shows some appetite. Some milk must be given to keep up the calf's strength, and it may be of some use to pasteurize the milk until the calf recovers, after which it will do better on unpasteurized milk. Contagious scours runs a course of several days, and it is worse than doing nothing to try and stop it suddenly. It is best to allow the scours to continue in a fairly acute form until recovery is complete, rather than to try and check it by use of astringents, which may cause a state of chronic indigestion. Calves properly brought from an attack of scours soon pick up and are as good as ever. While the calf is scouring perhaps five pounds of milk a day is enough. After it has recovered the amount of milk must be raised gradually as a relapse may occur from overfeeding, or indigestion may result.

In treating scours, formaldehyde is very useful. A stock solution is made up as stated before and twice or three times a day about two to four teaspoons in a half pint of warm water is given. A teaspoon of blood meal placed in the calf's mouth twice a day acts as a tonic and as a mild astringent. Enemas with hot water and Lugol's iodine solution bring great relief and are very helpful.

## Stock Feeds That Are Money Makers

Written for California Cultivator

**A**RTICHOKES are one of the best paying crops raised as they yield such a large amount of feed per acre. On good rich soil they sometimes yield 1000 bushels per acre, and from six to ten tons of tops. I planted a quarter of an acre on the 30th of May, on a poor clay point in Oregon, and in the fall pulled 52 sacks, just what pulled up with the tops, no telling how many there would have been if they had been dug, that is a yield of 300 bushels per acre. Horses, milk cows, sheep and goats like them and will eat the tops clean if turned in before frost bitten. Some people fill their silos with the tops to feed stock. One man in Polk County, Oregon, fattened 90 head of hogs on five acres of artichokes. Another writes me he sells \$1000 worth of pork every year fattened on artichokes.

### Artichokes and Alfalfa

My idea is this, to finish hogs out well they should be allowed to run on alfalfa or clover pasture while running on the artichokes, and a little ground oats and peas, or wheat or barley, would finish them up and make the pork more solid.

Cut and plant artichokes same as potatoes, a foot apart, in rows 3½ feet apart. Cultivate first year. Next spring, after hogs have dug them, plow and harrow ground well and pick up what's harrowed out on top and let them go. There are generally

enough in the ground to make a good stand; they will then take care of themselves. Remember and plant where you want them to stay for years and where it's handy to turn hogs in to dig them. If your soil is not sandy, but heavy, do not turn hogs in when too wet or ground will bake when it gets dry. Of course dig what you need for seed or feed for your stock and put in dry place for winter use and let hogs dig the rest. Then there is enough left in ground to seed the patch.

Where hogs are fed in this way it is much cheaper than in a corn country, and hogs do not die with cholera as a rule. Every rancher that keeps stock should raise an acre or more.

### Sudan Grass

Sudan produces a wonder crop of hay that stock will leave good alfalfa to eat, as it has a sweet taste and stock do well on it both to fatten and to produce milk. An up-to-date rancher in Fresno County last week told me that in 41 days (a month and 11 days) from sowing he cut three tons per acre last year, and it averaged seven feet high. It was cut twice after that. He also said his stock left alfalfa pasture to get the Sudan hay.

Another man said he cut his Sudan six times. It has been tried, sowing in March, April, May, June, July and August, and May sowing proves the best. If sown in August it does well

Clean and Clear  
as Water

Awarded  
Gold Medal  
Pan-Pac. Expo.

## For Retained Afterbirth

When a cow fails to "clean" promptly, she should be flushed out with B-K. A retained afterbirth neglected may cause Abortion or Barrenness.

B-K as a douche brings the afterbirth naturally—saves removing by hand. B-K kills the infecting germs and foul odors—beats the uterus—removes slime and acid—no straining—no irritation. B-K is much more effective and safer than lysol, carbolic acid, Lugol's solution and oily coal-tar disinfectants, which do not cleanse the uterus, but make it more acid.

If your dealer does not have B-K, send us his name.

FREE BULLETINS: Send for complete information—"special trial offer" and bulletins No. 52, "Contagious Abortion," and No. 136, "Calf Scours."

**General Laboratories**  
3127 So. Dickinson St.,  
Madison, Wis., U. S. A.

but time is short and you do not get so many cuttings.

If sown early in spring with alfalfa it doubles your hay crop the first year. When sown with alfalfa sow only half as thick as when sown by itself. At the end of the year the Sudan is gone and the alfalfa stays. Sow 18 to 20 pounds per acre broadcast, 10 to 12 pounds per acre if you drill it in.

#### Thousand-Headed Cow Kale

This makes green feed all winter for milk cows, hogs and chickens. It is excellent for milk cows, increasing

the flow of milk. It is almost unbelievable what it will yield per acre. One head has been known to weigh 60 pounds, and in planting there should be 5000 plants per acre. Plant the seed in boxes or rows early in garden and transplant like cabbage. If planting a large patch plow a furrow and lay the plants on the furrow and cover plants with plow. Plant in every third furrow, then roll ground with heavy horse roller, and most of the plants will live. Be sure and plant close to feed yard to be handy to cut and feed green each day. It takes less than a pound of seed per acre.

## Bulletins on Sheep

"The American Sheep Breeder" gives the following list of bulletins of value to those interested in sheep: U. S. Bulletins

"Breeds of Sheep for the Farm," by F. R. Marshall, Farmers Bulletin 576, 16 pages, covers the principal breeds and their special adaptation.

"Equipment for Farm Sheep Rais-

keting, making this a concise, direct, easily handled bulletin.

These three can be secured by writing Chief of Bureau of Publications, Department of Agriculture, Washington, D. C.

#### State Bulletins

ing," by V. O. McWhorter, Farmers Bulletin 810, 27 pages, contains barn plans and descriptions, feeding racks and troughs, hurdles, lambing pens, fencing, etc.

"Farm Sheep Raising for Beginners," by F. R. Marshall and R. B. Millen, Farmers Bulletin 840, 24 pages, discusses sheep prospects, requirements for sheep raising, starting the flock, breeding season, winter care, lambing, the summer and mar-

62 pages, another excellent bulletin covering the management of sheep as well as breeds. Write Pennsylvania State College, State College, Pennsylvania.

"The Sheep Industry in New York State," Bulletin 96, New York Department of Agriculture, Albany, N. Y., 230 pages of sound breed discussion and management problems.

## Field Notes from the Live Stock Men

Another 32 pound record has been made in New York by a Holstein-Friesian. Segis Hengerveld Fayne Johanna 173739, owned by Oliver Cabana, Jr., has shown a production of 649.6 pounds milk containing 32.112 pounds fat in seven consecutive days. She freshened at the age of six years, one month, 27 days. Her sire is Woodcrest Nig De Kol 40719; her dam is Segis Fayne Johanna 114658. With this production she is the thirtieth cow to obtain place in the list of Holstein-Friesian cows with productions exceeding 32 pounds fat in seven days. Computed on the 80 per cent basis the equivalent butter claimed for Segis Hengerveld Fayne Johanna amounts to 40.14 pounds. Fairview Korndyke Hengerveld 3d 203558, also owned by Mr. Cabana, is reported as producing 607.8 pounds milk containing 31.425 pounds fat, with the test still in progress.

Tilly Alcartra has now been on strictly official test for over 100 days of her sixth lactation period. She is milking over 100 pounds per day at this time, and is over 650 pounds of milk ahead of the first 100 days in

the year in which she made her world's record. She is also making the biggest butter record of her career and unless something unforeseen happens she will do something remarkable for both milk and butter during this year.

One of the finest Holstein herds on the Pacific Coast will be sold at dispersal sale in May. This is the La-Conner Flats Stock Farm herd of 90 head, owned by J. H. Hulbert Jr., Mount Vernon, Washington. The herd contains a large number of noted show animals and producers, including the great heifer Ormsby Segis Marie, who recently completed yearly records as a senior three year old of 27,186.8 pounds milk and 1089.6 pounds butter in one year, the world's record for milk and second highest for butter in class. The sale will be held on the farm on May 25, under management of California Breeders Sales and Pedigree Company, Sacramento. Col. Ben A. Rhoades, Los Angeles, will be the auctioneer.

Aralia De Kol Mead has just completed a strictly official yearly test in the herd of A. W. Morris & Sons,

## IF COWS COULD TALK

"Good morning, Mrs. Fawncoat. I hear that all the cows in the county are joining the 'Win-the-War' Club."

"Yes, Mrs. Starface; Secretary of Agriculture Houston says we must increase the production of butter-fat, and we cows have all promised to do our 'bit'."

"There's one thing I want to say right now," spoke up Mrs. Black. "The farmers have got to back us up in this movement. I'm with the rest of you, heart and soul, but what chance have I got?"

"Why, Mrs. Black, what's the matter? You have a fine warm barn and plenty to eat and drink."

"Yes, I know; but what can I do as long as they use that old cream separator on the place? It never was any good, anyway, and now it wastes so much cream I'm just plain discouraged."

"Well, you're not so badly off as some cows, where they haven't any cream separator at all."

"I don't know about that. There's a lot of cream separators in this county that are only 'excuses'—not much better than none at all. I tell you, Mrs. Fawncoat, with butter at present prices and the people at Washington begging every one to save fat, it's almost a crime to waste butter-fat the way some of these farmers do."

"That's one thing I'm thankful for," said Mrs. Fawncoat, "there's no cream wasted on this farm. We have a De Laval Cream Separator and everybody knows that the De Laval is the closest skimming machine."

"Well," said Mrs. Starface, "we never used a De Laval on our place until last fall and supposed one separator was about as good as another; but, honest, the De Laval is the first cream separator we've ever had that gave us cows a square deal."

#### P.S.

Of course your cows can't talk—but if they could you'd never have a moment's peace until you got a De Laval Cream Separator. Remember that a De Laval may be bought for cash, or on such liberal terms as to save its own cost. See the local De Laval agent, or if you don't know him, write to the nearest De Laval office as below.

## Dispersal Sale of a Great Herd of Registered Holsteins

### 90 HEAD

#### La Conner Flats Stock Farm

owned by J. H. Hulbert, Jr.

Mount Vernon, Washington, Saturday May 25, 1918

This is an exceptionally high class herd of producers and show ring winners, possessing a high degree of uniformity in breeding and type. The herd has been tuberculin tested regularly for several years, and for some time past has been under Federal supervision. In addition all animals over six months of age are sold subject to 60 day retest.

ORMSBY

SEGIS

MARIE

A grand-daughter of King Segis.

Her records at three years six months:  
Milk 7 days 640.3  
Butter 7 days 26.83  
Eight months after calving:  
Milk 7 days 493.6  
Butter 7 days 19.90  
365 days semi-official:  
Milk ..... 27,186.8  
(World's record in class)  
Butter ..... 1089.67

THE SALE WILL INCLUDE:

ORMSBY SEGIS MARIE, together with her yearling son by Segis Pontiac Acme.

FORTY-TWO DAUGHTERS OF SEGIS PONTIAC ACME, whose dam is a high yearly record daughter of the former world's record cow, Riverside Sadle De Kol Burke. His first four daughters to freshen as two year olds are now on test and have 15, 18, 20 and 23.9 pounds butter respectively to their credit in seven days.

A TWO TIMES 30 POUND COW and her two daughters.

FORTY-SIX DAUGHTERS OF A. R. O. COWS, 32 of them out of dams with records above 20 pounds butter in seven days.

FORTY CHOICE COWS AND HEIFERS bred to four great yearly record bulls.

There are many outstanding individuals in this sale, including prize winners at the major Northwest shows and a second prize winner at the 1917 National at Columbus, Ohio.

## Keep Your Eye on This Breeding

Miss Valley Mead De Kol Walker has been taken off test, just 30 days before due to calve again. In 335 days she made 21,915.6 pounds milk and an even 1111 pounds butter, the second highest yearly butter record for a junior three year old of the breed. She already holds the world's record for butter in seven days eight months after calving in two classes.

## Prince Alcartra Korndyke

other cow of any age or breed. And today at past nine years of age she is making the greatest record for milk and butter of her whole career. We have only a few sons of Prince Alcartra on hand. We know if you could see them and find how moderately we price them that you would want one to head your herd. Come and see us, or write your wants.

The J. S. Gibson Co.

Williams

California

Woodland. In 365 days she made 23,043.7 pounds milk and 1214.95 pounds butter, giving her the second highest yearly butter record in the Morris herd. She is by King Mead of Riverside and is out of Aralia De Kol. She is also dam of Aralia De Kol Pontiac Mead, who holds the California senior two year old yearly butter record with a production of 934.25 pounds and who recently made over 34 pounds butter in seven days as a senior three year old.

Zaza Tuebie Prophetess, a junior four year old in the A. W. Morris & Sons herd, recently made 26.25 pounds butter in seven days, milking over 90 pounds her best day.

Miss Filled Korndyke Walker, daughter of Prince Gelsche Walker and a 29.67 pound daughter of Korndyke Queen De Kol's prince, recently freshened as a junior two year old, dropping a fine heifer calf by King Morco Alcartra, son of Tilly Alcartra. Placed on official test she made 19.23 pounds butter in seven days, milking over 60 pounds in one day. She will be bred to W. J. Higdon's \$6500 bull King Korndyke Pontiac 20th. She is owned by E. D. Barry Jr., Daggett, who purchased her in the Guaranty Sale last December.

Lively interest is reported in the North San Joaquin Breeders First Consignment Sale to be held at Modesto on May 9, when 50 head of registered Holsteins will be sold under the sales management of California Breeders Sales and Pedigree Company, Sacramento. There are many fresh cows and heifers, as well as heavy springers in the sale, and these are proving attractive to the large number of owners of grade herds who are planning to buy a few purebreds this spring.

The Conejo Ranch, Harold H. Braly, manager, announces a splendid demand for pure bred hogs during the past two or three weeks. One of the largest sales of Conejo stock reported during the past ten days was to J. W. Jamieson of Los Angeles who purchased 50 Hampshires, five Duroc-Jersey sows and a boar, 25 Hampshire gilts for an average price of \$60 each. Other sales of Conejo stock are reported to the following: Ralph Daily of Camarillo, one Hampshire sow and a boar for \$300; C. J. Gilbert of Lancaster, five Hampshire sows for \$625; Joseph Russell, Triunfo, one Hampshire sow for \$100; Frank Crowley, Newbury Park, one Hampshire sow for \$125 and Charles E. Shattuck of Los Angeles four Hampshire sows for \$625.

### RED CROSS SAMMY

Continued from Page 539

above a ton was purchased by Julius Hauser, of the Hauser Packing Company of Los Angeles. It was brought to Los Angeles and exhibited with some of the other fine specimens at Red Cross headquarters, and Mr. Hauser, who has already lost one son in the war and has others ready for service if need be, gave to the Red Cross the champion of the bunch. The steer was sold to Carl Leonardt by the Red Cross auctioneers for a neat \$1600. Reserving for himself one choice cut from the steer Mr. Leonardt turned it back to the Red Cross and it was again put on the auction block and sold to Youngs Market Company for \$1400. By this time the steer had acquired the name of Red Cross Sammy, and the original selling price, together with the Los Angeles auction sales, aggregated \$4390, all net to the Red Cross. In

addition to this steer the Hausers donated six champion Shropshire lambs. One of these lambs was sold for \$225, and another brought \$200. Another feature of the sale was a Poland-China sow which sold three times, the lowest price being \$100 and the aggregate of the sales being \$335.

### SUCCESSFUL RED CROSS SALE

One of the principal features at the University Farm Picnic last Saturday was the sale of pure bred live stock, proceeds from which were given to the Red Cross. As to the sale Prof. Woll writes:

Your readers will be interested in the enclosed statement of the results of the auction sale for the benefit of the Red Cross, held at the University Farm Picnic, April 20. The sale, which netted slightly over \$1500, was an offshoot of the state dairy cow competition, just completed. Most of the animals and the dairy apparatus sold were offered as prizes in the competition, that were not awarded from lack of qualified competitors, and the donors allowed us to use the prizes in the manner and for the purpose stated.

Following is list of sales:

White Knight, Shorthorn bull, donated by T. S. Glide, Davis, sold to Dr. Elbury, Woodland, \$325.

Jersey calf, La V. Adelaide's King, donated by N. H. Locke Company, Lockeford, sold to Shafter Estate, Inverness, \$155.

Jersey calf, donated by C. G. McFarland, Tulare, sold to Shafter Estate, Inverness, \$70.

Ayrshire calf, donated by E. B. McFarland, San Mateo, sold to George McConnell, Elk Grove, for \$100; Dean Thos. F. Hunt, Berkeley, \$100; George McConnell, Elk Grove, \$50; W. H. Wright, Davis, \$50; James Scarlet, Yolo, \$50; W. O. Russell, Davis, \$50; George Dally, Elmira, \$30; total, \$430.

Holstein calf, donated by A. W. Morris & Sons Corporation, Woodland, sold to S. Lawson, Woodland, \$490.

Mule-foot gilt, donated by Edwards & Ward, Danville, sold to Dally Bros., Elmira, \$37.50.

M-2 Baltic Hand Separator, donated by Empire Separator Company, Bloomfield, New Jersey, sold to A. T. Blizzard, Denair, \$30. The sale totalled \$1537.50.

### A WONDER BULL BORN IN MORRIS HERD

Just 21 days after she completed her remarkable year's record of 1111 pounds butter as a junior three year old, Miss Valley Mead De Kol Walker has dropped a beautiful bull calf by Sir Aaggie De Kol Acme, in the A. W. Morris & Sons herd of registered Holsteins at Woodland. The great youngster is nearly white in color, and seems in every way just what it was hoped he would be. It is doubtful if a Holstein bull was ever born that has more to commend him than this young fellow, for pages might be deservedly written about the individual ancestors for many generations back. But as a brief summary the average records behind him are of interest. His three nearest dams, one of them a junior three year old, another a senior four year old, average 625.36 pounds milk and 32.91 pounds butter in seven days. His seven nearest dams average 626.44 pounds milk and 30.41 pounds butter in seven days. His three nearest dams, two under mature age, average 22308.2 pounds milk and 1151.37 pounds butter in one year, all of them testing over four per cent for the year with an average of 4.17 per cent. Five of his seven nearest dams, all that were tested for one year, including two present world's cows and two former world's record cows, average 22009.33 pounds milk and 1081.05 pounds butter in one year, average test 3.93 per cent, and these records include two heifer records and the 11 year old record of Aralia De Kol. As far as we know there is no other bull in the world that can anywhere near approach this combination of high production with such a desirable percentage of fat in the yearly records of his nearest dams, and the influence of this young bull upon the Holstein breed should be remarkable as he represents a blending of the blood of many outstanding animals with common characteristics. This bull is the meeting point of most of the time, effort, and study that the Morris organization has put into the advancement of the Holstein breed during their breeding career, and through him they expect to carry their great work still farther.

## Here Is The Alfalfa Cutter You Have Been Looking For

The Light Running

## ACME Feed Cutter and Silo Filler

A combined silo filler, feed cutter and alfalfa meal machine. A useful machine for all seasons of the year. Its center hung blower and three-bearing main shaft reduce vibration to the minimum. The frame is all steel. Can't warp, nor the bearings get out of alignment as is the case with the old style wood frame cutters. Cuts anything—will fill the highest silo. Catalog and sample of alfalfa meal mailed on request.

### Good Juicy Milk-Producing Silos

Well cut and well kept silage keeps up the milk flow when green pasturage is not available. It reduces feed costs 15 per cent to 25 per cent and keeps cows in fine condition.

### Ideal Green Feed Silos

LEAK PROOF

PERMANENT

A perfect design. The result of over 20 years experience in designing and erecting silos.

## North San Joaquin Breeders First Consignment Sale

**50 REGISTERED HOLSTEINS 50**  
**Modesto, California, Thursday, May 9, 1918**

### Contributors:

J. W. Benoit, Modesto.  
J. A. Pelanda, Modesto.

H. E. Cornwell, Modesto.  
R. L. Holmes, Modesto.

Gotshall & Magruder, Ripon.

We believe that those who intend to purchase registered Holsteins will be pleased with the offerings in this sale, which is comparatively small in numbers but high in average quality.

In this sale J. W. Benoit will sell his entire milking herd with the exception of three head, including his show ring and butterfat contest winners and his good A. R. O. cows. His herd sire, El Prado Wayne Colantha, out of a 30 pound dam and sired by Colantha Sir Pontiac Aggie, was first prize aged bull at California State Fair, 1917. This bull is catalogued in this sale as a reference sire, but we are authorized by Mr. Benoit to state that he will be led into the sale ring on sale day with a price of \$1500 on him and after one bid above that price he will be sold to the highest bidder without further reserve. This is a splendid sire and the price Mr. Benoit puts on him is unquestionably well within his value, and he would be priced only because Mr. Benoit's herd will be composed almost entirely of daughters of this sire after the sale.

Gotshall & Magruder sell an unusually good lot of females, bred to very high class bulls, and in this consignment buyers will find both cows and heifers to their liking.

R. L. Holmes sells two splendid young cows that would make an attractive consignment in any sale.

H. E. Cornwell sells one of the very good young females in his herd, not because he wants to sell her, but as a compromise after our urging him to consign to this sale.

J. A. Pelanda sells some bred heifers that are choice and promising, and are just about ready to make money as dairy producers, aside from their value as breeding animals.

**THERE ARE 20 COWS AND HEIFERS WITH OFFICIAL RECORDS UP TO OVER 24 POUNDS BUTTER IN SEVEN DAYS IN THIS SALE** including daughters and granddaughters of great producers, from some of the most famous families in California.

**THERE ARE SIX CHOICE YOUNG BULLS IN THIS SALE**, good individuals, and of choice breeding, the kind that ought to be used as herd sires.

The sale will be governed by the regular sales rules of this company, every animal pledged to absolute sale without reserve, limit, or by-bid, every animal guaranteed to be a breeder, tuberculin tested and sold subject to tuberculin retest by the purchaser.

**SALE WILL BE HELD AT MILLER'S STABLE, 11TH & G Sts., Modesto, Thursday, May 9, 1918, beginning promptly at 10:00 A. M.**

Catalog free on request.

### Management

**Woodland : : : California**

## Holstein Progress at Hollywood Farm

There is unquestionably no better equipped Holstein breeding establishment on the Pacific Coast than Hollywood Farm, owned by F. S. Stimson, Hollywood, Washington, and the big herd is being developed along lines that promise to surpass its already great accomplishments.

When the herd was founded some years ago, the well selected breeding females were headed by King Palmyra Fayne, grandson of King Segis, his sire being King Fayne Segis, sire of the only 50 pound cow, and his dam being Bloomingdale Hengerveld Palmyra, a 30.40 pound daughter of Hengerveld De Kol. This sire unfortunately died young, but today has 31 A. R. O. daughters with records up to over 32 pounds for a junior four year old, 27 of them being still members of the breeding herd at Hollywood.

The next sire to be used was Hollywood Lilith Palmyra, son of King Palmyra Fayne, and out of Lilith, Queen Pauline, 32.47 pounds butter in seven days, 26,135.9 pounds milk and 1077.21 pounds butter in one year. He too died young, but there are about 50 of his daughters at Hollywood Farm at present, and they are most promising. He already has nine A. R. O. daughters, the first one to freshen as a junior three year old, Hollywood Lilith Mercena, making official records recently of 531.6 pounds milk and 33.44 pounds butter at three years four months.

About this time also a young sire, Sir Bessie Homestead Sunnyside, was used in a limited way in the herd. This young bull was by a son of the famous 34 pound cow Jessie Fobes Bessie Homestead, and out of a 30.51 pound daughter of Fobes Tritomia Mutual De Kol.

Thus up to this point we find that the increase in the herd has been largely from the services of a grandson and a great grandson of the great King Segis.

With a definite idea of what he wanted to establish in the way of blood lines at Hollywood Farm, Mr. Stimson set about the selection of his next herd sire, and seems to have been extremely fortunate in being able to purchase at a long price the great proven sire Judge Segis, son of King Segis. Although formerly in a select herd of small numbers, where he was given most limited service, he has 28 A. R. O. daughters to his credit, the first one to be tested at past five years being Vanderkamp Segis De Kol, who made an official record of 37.57 pounds butter in seven days. He is also sire of the 28.55 pound two year old Vanderkamp Segis Eva.

Judge Segis combines with his rare breeding and proven worth as a sire, a commanding individuality. He is wonderfully long and deep of body, strikingly masculine without a suggestion of coarseness, weighing in breeding condition over 2600 pounds, and displaying unmistakable spirit and vigor.

It is Mr. Stimson's avowed purpose to use Judge Segis on right close to 200 females per year, giving him an opportunity such as has never been afforded to any other sire in service in the West and to few sires in the whole country. Thus through his service at Hollywood, a large number of females sired by a grandson and by a great grandson of King Segis will be bred to one of the best sons of King Segis, bringing about an intensification of this blood that can hardly fail to produce some outstanding Holsteins.

The herd at Hollywood Farm now contains around 275 head, including 12 cows with records from 30 to 42 pounds butter in seven days, and a considerable number of large yearly record cows.

Of course the queen of the establishment is Glen Alex Queen De Kol, 603.8 pounds milk and 42.35 pounds butter in seven days as a two year old, the world's record heifer for which Mr. Stimson paid \$18,000 in the Worcester sale.

Then there is the 38.14 pound cow Pietertje Floa Artis, who was for a long time the highest record cow developed on the Pacific Coast. And just lately Pietertje Korndyke Abbe-kerk, a granddaughter of Pontiac Korndyke, made official records of 712.9 pounds milk and 35.37 pounds butter in seven days. This cow is an impressive individual, one of the biggest, roomiest cows the writer remembers having seen.

The 33.44 pound junior three year old daughter of Hollywood Lilith Palmyra, Hollywood Lilith Mercena, has already been mentioned, and in connection with her it is interesting to note that her dam, Hollywood Mercena, recently made official records of 553.7 pounds milk and 28.19 pounds butter in seven days.

A most promising heifer noted during my somewhat hasty observation of the herd is Hollywood Lilith Bonheur, daughter of Hollywood Lilith Palmyra, who recently completed official records of 573.4 pounds milk and 24.32 pounds butter in seven days, 2350.6 pounds milk and 101.67 pounds butter in 30 days at the age of two years three months.

An unusually interesting pair was noted in the heifer S. V. H. Flora Vale and her heifer calf. S. V. H. Flora Vale is by Sir Veeman Hengerveld and out of K. K. S. V. Cora, 32 pound three year old daughter of King Korndyke Sadie Vale. Freshening at two years two months, she had to her credit when I saw her 20.10 pounds butter in seven days. She is herself intensely bred, but her heifer calf, sired by King Korndyke Sadie Vale, probably carries as many close up crosses to the great Sadie Vale Concordia as any calf in existence.

It is needless to say that the sanitary conditions about this great breeding plant are of the highest character. The herd is under federal supervision in testing for tuberculosis, the federal method being the plan in which Mr. Stimson is a firm believer.

### FRESNO HAS LIVESTOCK ADVISER

R. N. Davis, a man of training and experience in animal husbandry and dairying, is now associated with the farm adviser's office in following up work carried on by Frank T. Murphy, who resigned as assistant farm adviser to enter the veterinary corps of the army. Mr. Davis is beginning his work in the county in cooperation with the directors of the cow testing department of the Riverdale Center.

### WHAT IS BETTER THAN A SILO? —TWO SILOS

Riverdale Center members are keen for the silo as well as for all other modern ideas in dairying. Only one man complains about the silo, and he says, "My kick is that I didn't build two last fall instead of one."—Fresno County Farm Bureau Monthly.

### STOCK AUCTION SALE FOR FRESNO

Fresno County farmers have decided to inaugurate live stock auction sales. The county farm bureau directors have appointed a committee to arrange details of the first sale. This committee is composed of Directors Poytress, Avenell and Helsing.

## The Honey Bee and Its Care

### GOOD HONEY YIELD IN PROSPECT

The honey outlook for California is of the best. With plenty of rainfall all over the state there will be an abundance of wild pasture. Several apiaries were destroyed by last summer's heat and fires, especially in the Ventura and Santa Barbara sections, so that reduction in number of bees will affect the output to some extent.

### BEES IN THE ORANGE GROVES

"Make honey while the orange blossoms bloom" is the slogan of the busy bees these April days. Thousands of the little sugar makers are humming in the groves and packing away the honey that will take the place of the sugar we must send across the ocean. Many of the apiarists follow the orange bloom from early to later blossoming districts, thus securing a good supply of orange blossom honey.

### ITEMS IN SEASON

Writing in the Western Honey Bee, L. L. Andrews gives some good advice:

"Manipulation is the watchword in the apiary this month. See that all colonies have good queens and stores enough to carry them through a week or two of cold or unfavorable weather.

"Mark all hives—strong, medium, or weak. When the strong ones are ready for a super, put it on, and as soon as the queen has sealed brood above, it will be safe to take from the strong and help the medium. In this way you always have a good per cent of colonies ready for the honey flow and the poorer ones coming on all the time.

"As soon as the extracting starts, very little danger from swarming need be anticipated. Frames of well-sealed brood, with a good "ridge" of honey above, can be put through the extractor and the brood given to strengthen the weak colonies.

"To run without excluders until after the swarming season, then look carefully through the lower story to

make sure everything is o. k.—a good queen, all good brood combs and some honey—after which put on excluders, has proven very satisfactory with us.

"Who can say what the season will prove to be as a honey producer? Never saw sage so late in starting, but must say it looks thrifty, and many old-timers think there is plenty of time for a crop. Let us hope so. The first requisite is to have the dish right side up when the time comes. Have seen a good honey crop with no more rain than has fallen on our ranges this season."

### THE FARM APIARY

The shortage of sugar has awakened us to a realization of the value of a few hives of bees on the farm. The cost of starting an apiary is not great. One colony of bees will cost about \$5.00, and a person starting out with five colonies should be able with an average amount of care to increase this number to ten colonies within a year. In the orchard one hive of bees is sufficient to pollinize an acre of trees.

An interesting experiment carried on at the University Farm apiary during the last winter showed the value of fall packing the hives even in the mild climate of the Pacific states. Five colonies were packed with straw and five were left covered on their stands. During the winter two of the unprotected colonies were lost, while all of the packed colonies survived the winter period.

The California Honey Producers' Cooperative Exchange has been holding meetings throughout the latter half of the month in San Diego and Imperial Counties. Throughout the state over 20,000 colonies have already been signed up.

At the last meeting, April 6, of the Los Angeles County Beekeepers' Club plans were made to buy cooperatively cans and cases for members. This will mean a saving of nearly 20 per cent.

## Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Bats

We have a large tank house on our ranch and we are continually bothered with bats. We have a screening around the top, on the inside of the house, but this method seems ineffective. What would you advise to be done in order to get rid of the pests?—Subscriber, Bakersfield.

We are unable to give our subscriber any help in this matter. Have any of our subscribers experience in control of bats?

### Spray for Morning Glory

We understand that the college of agriculture at Berkeley is advocating the use of poison spray to kill morning glories. Please tell me what it is.—Subscriber, Camarillo.

Circular number 168, issued by the College of Agriculture, Berkeley, reviews successful experiments in control of morning glories by use of an arsenic spray. It particularly emphasizes the fact that it has been found practical only in Coast sections within the fog belt. This of course includes Camarillo. Also, we may add Farmers Bulletin 388, "Eradication of

Bindweed" may be secured by writing Division of Publications, Washington, D. C. The Hawaiian Agricultural Experiment Station also reports excellent results from the use of carbon bisulphide. This however, is very expensive. The same station has also issued a bulletin on "Killing Weeds with Arsenite of Soda." The bulletins describing these two methods of eradication we think may be secured free upon request to Hawaiian Agricultural Experiment Station, Honolulu.

### Barrenness in Rabbits

My does refuse to breed. What is the reason? They are not overfat, are fed a little green stuff and grains as needed.—Subscriber, Los Angeles.

Not knowing all conditions of feeding and care or condition of stock, we offer these rules and suggestions and ask that you govern yourself accordingly: Does bred over six times per year or allowed to be with young over ten to 12 weeks, often get this way. Take does to buck's hutch. Never leave her there long. Never permit buck to punish doe. Timid does become frightened with some bucks; again does have their favorites, so try different bucks, often putting her in

Body Built for Country Loads

Truck Built for Country Roads

## Patriot Farm Truck

The farmers of America now have what they have been waiting for—

A truck built for farm conditions and farm work.

No intelligent farmer questions the superiority of truck service over horse service for general transportation. The only question has been whether the trucks built for service over the paved streets of cities, with bodies designed for city haulage, were the proper trucks for farm use, and most farmers have felt they were not.

The Patriot Farm Truck affords the farmer economy, convenience and certainty of transportation of his crops and live stock.

The Patriot will double or treble your load capacity and cut the time of delivery in two. It makes you master of weather and roads, and cuts the distance to your market town to one-fourth.

The Patriot will increase the value of your farm \$10 an acre by bringing larger and better markets within your reach. It will pay for itself within one year. Write for full information and prices.

## The Evolution of Irrigation

Just as the Open Irrigation Ditch was superseded first by wooden, and then by concrete flumes, so were the latter in turn forced to give way to the "K-T SYSTEM" of underground conduits, equipped with gates and valves. This provides for a perfect distribution of the water at the exact spot required, and at just the time it is needed. It also eliminates the constant losses resulting from evaporation, seepage, and ditch choked with weeds—wasting land, water, time and money.

Write today for our Special Booklet, which gives complete detailed information.

**KELLAR-THOMASON CO.** 1226 East 28th Street  
Los Angeles, Cal.

"Originators of the Valve System of Irrigation."

## This Saw Cuts 25 Cords of Wood in One Day

It is absolutely guaranteed—hundreds in daily use.

Write for our booklet "How Dan Ross Cuts 40 Cords a Day".

Delivered anywhere in the U. S. A. only

\$165

**Wade's Gasoline Wood Saw**  
4 H. P. Engine (Portable)

This wonderful invention does TEN TIMES the work of TWO MEN in the woods. With it you can make money out of your wood simply through the immense saving in time and labor. One man can handle it on a log and two can move it from log to log. Will cut a 40 inch log in five minutes. Write us today.

**S. C. Rhode Island Red Eggs.**—Choice stock, settings \$1.25. Pekin duck eggs, settings, \$1.50. Mrs. W. E. Court, Lathrop, Route 1, California.

**"Eastman's Bred-to-Lay"** Hoganized, trap-nested Barred Plymouth Rocks; April chicks, March eggs. Fairmead Poultry Farm, Fairmead, California.

**Black Orpingtons Lay, Weigh and Pay.**—Prize winners at leading shows. Write for mating list. IVEYMOOR FARM, San Leandro, Cal.

**Buff Orpingtons, Buff Ducks, Bourbon Red Turkeys.** Hatching eggs; baby stock; mating list. The Ferris Ranch, S. Reservoir, Pomona, Cal.

**Trapnested White Leghorns.**—Official 200 egg records, also eggs from above \$2 per 15, \$8 per 100. Circular. Hudson Poultry Farm, Escondido, Cal.

**For Sale.**—Barred Rock, R. I. Red and White Leghorn chicks. Reduced prices. Fine stock. Madera Hatchery, Madera, Cal.

**Chix.**—Buff, Brown, and White Leghorns (Barron strain), Anconas, Minorcas, Reds, Orpingtons, Rocks, Silver Campines and breeding cockerels. Enoch Crews, Seabright, Cal.

## HOGS

**Make Big Money**—You can, even at present price of grain, if you have our famous Whitten Ranch Poland-Chinas—the mammoth, prolific, fast-growing, easy-feeding kind. Special sale of weaned pigs, many sired by our great \$1000 Jumbo Model. Prices reasonable; satisfaction guaranteed; everything immune. Send for free illustrated booklet, "Hogs for Profit." Packed with valuable information; tells how to become successful. Ranch in Tulare County, but address owner, R. H. Whitten, 519B Marsh-Strong Bldg., Los Angeles.

**BERKSHIRES** **GUERNSEYS**

## —GRAPE WILD FARMS—

At present the oldest boars we have to offer are of September and October farrow. They are by Royal Superbus and Fashion Longfellow 27th. We also have a limited number of gilts to offer, bred for May farrow.

A. B. HUMPHREY,  
Escalon, San Joaquin County, California.

**Poland-Chinas**—Will book a few more orders for May and June delivery, weaning boar pigs out of my best outstanding money making, easy keeping sows, sired by Model Major, first prize winner at Sacramento State Fair 1916 and sire of the 1917 State Fair grand champion or I. B. A. Wonder reserve grand champion at the Panama Pacific International Exposition at San Francisco. Hale I. Marsh, Modesto, California.

**The Billiken Brand of Chesters**—The easy feeders and the money makers. The future outlook for hogs was never so good before. Am offering a few fall sows, bred to farrow their second litters in May. Some extra nice spring gilts bred to farrow in June. Fall pigs, both sexes. Write now for prices; immediate delivery. C. B. Cunningham, Mills, Sacramento County, Cal.

**Poland-Chinas**—A few very fine young boars, October litters, out of Darkness C. by I. B. A. Wonder. Take 'em within 30 days at \$30 each. Now booking orders for spring farrow from Big Bone Bob, Golden Gate King, and Big Kover, from our own prize winners and the fine sows we have recently purchased in the East. W. A. Young and J. A. Clark, Lodi, California.

**Superba, World's Grand Champion Poland-China** boar and one of the greatest sires of the breed. Spring boars ready for service, also few sows bred to this noted sire, reasonably cheap. Rough's Greenfields, Arlington Station, Riverside, Cal.

**We Pay Cash for Hogs of All Sizes,** weights and breeds. Any number from one to several thousand considered. What have you? Durbin & Forbes, 722 San Fernando Building, Broadway 4170, 3030 E. Vernon Ave., South 2712-J, Los Angeles.

**Copro (Made from cocoanuts)**—Best hog-feed. Your dealer, or Lee Chamberlain & Co., Los Angeles, Cal.

**Duroc-Jerseys**—Sold out. Pigs by the Junior Champion and out of winning sows in May. Frederick M. Johnson, Napa, Cal.

**Large Yorkshires**—The ideal hog for the progressive farmer. Service boars and fall pigs, both sexes, for sale. A. L. Tubbs Co., Calistoga, Cal.

**Pork Production Campaign Supply**—Quantities of thorough bred sows, boars and weaned pigs. Holmes Date Gardens, Indio, California.

**Tamworth Gilts**, bred to Tamworth boar. Weight 150 to 200 pounds at 20c pound. Crated, f. o. b. Monte Vista Ranch, Spring Valley, San Diego Co., California.

**Large Type Poland-Chinas** are prolific and profitable. Can furnish boars any age at reasonable price. J. A. Crawshaw, Hanford, Cal.

**Rancho Rubio Durocs** all sold out except some choice fall boar pigs. Write for prices. Elmer Lamb, Ceres, Cal.

**Duroc-Jerseys**—We breed the champions. Peters, Lamson & Walker, Devore, San Bernardino County, California.

**Greenwood Farm Durocs**—"Size with Quality." H. C. Witherow, Palo Cedro, Cal.

**Registered Poland-Chinas**—Service boars and weaning pigs for sale now. Best stock. C. R. Hanna, Riverside, California.

**HEWITT'S BIG TYPE POLAND-CHINA** gilts and boar pigs. Hewitt & Hewitt, Dixon, Cal.

**Registered Durocs of the big type**—Cholera immune. Derryfield Farm, Odd Fellows Building, Sacramento, Cal.

**Carruthers' Farm Berkshire Hogs**—Our herd won Premier Exhibitor prize at the P. P. I. E. Exposition, Mayfield, Cal.

**Poland-Chinas**—A few good breeding boars. S. F. Williams, Orland, Cal.

## AGRICULTURAL IMPLEMENTS

**IMPLEMENTS AND RANCH SUPPLIES.** Samples and slightly used. Four floors. Large stock. Liberal credit. Save 50 per cent on some. No branches. ARNOTT & COMPANY, INC.

The Yellow Front. Established 1892. 112-118 So. Los Angeles St., Los Angeles

**For Sale**—We have several slightly used two row corn planters. Greatly reduced price. Write quick for price and circular. ARNOTT & CO., 112 S. Los Angeles St., Los Angeles.

## AUTOMOBILE TRAILERS

All Sizes. See our stock. Immediate deliveries. Lowest prices. Arnott & Company, Inc., 112-118 So. Los Angeles St., Los Angeles.

## PATENT ATTORNEYS

Patents that protect are secured through The PACIFIC COAST PATENT AGENCY, INC., Savings & Loan Building, Stockton, California; send for our little booklet on "Patents."

Patents—Copyrights, trade marks and labels registered. Solicitor of American and foreign. James R. Townsend, 712 San Fernando Bldg., Los Angeles. Phones: Home A4619; Sunset Main 347.

## MACHINERY

**FOR SALE—WHY BUY NEW?**  
SAVE YOU HALF

**MATERIAL GUARANTEED**  
**USED PLOWS, CULTIVATORS, DRILLS**—Extension disc cultivator, \$29.50; single disc riding plow, \$47.50; 14-in. Gilpin Deere riding plow, \$29.50; 4-gang Stockton, fine shape, \$27.50; spike harrows, \$16; sundries, cheapest in town.

**BETTER DRILLS**—Ready to ship, \$39 up.  
**WINDMILLS, MORE FOR LESS**—16-ft. mills for irrigating, \$95; 8, 10-ft. mills. Now is time to get what you want, when we have complete stock ranch tools.

**HOW'S THIS?** 30,000 gal. Redwood tank, lug hoops, \$135; 1100 gal. redwood, \$19; 1500 gal. \$22; heavy steel galv. barrels, \$6.75; galv. drums, \$4; 30 gal. hot water boilers, \$3.50; 500 gal. corrugated tank, \$19.50; 8000 gal. heavy corrugated galv. tank, \$135; 10,000 gal. heavy corrugated galv. tank, \$175; 900 gal. heavy riveted steel tank, \$68; 5 wagon tanks, \$28 to \$48; new, used redwood and galv. tanks all sizes.

**COMPLETE PUMP OUTFIT**: 3-in. Krogh vertical pump, shaft, 8 hp. engine belt, on cars, \$350.

**COMPLETE PUMPING PLANT**—Fine job only used two years. 8 hp. engine, 20-stroke Meyers Bulldozer pump. Jack, hardwood rods, 7-in. brass cylinder, 100-ft. 8-in. casing, \$450. Office DEMITT CO., 120 N. Main, upstairs. Yards, 816 Yale, Los Angeles.

## STOP THAT SLIP

It costs you money every hour you run the Pumping Plant. "MASTER-GRIP" PULLEY COVERING PERMANENTLY STOPS AND PREVENTS any belt slippage. Quickly applied to any pulley in a few minutes. Only 80c per square foot by Parcel Post. Tell us the size of your pulleys. SEND FOR INFORMATION AND SAMPLE.

FIDELITY SUPPLY CO.,  
Manufacturers.  
Phone, Broadway 3150.  
1207 Marsh-Strong Bldg., Los Angeles

**For Sale**—One 18 h. p. "Olds" distillate engine, mounted on wagon. One 50 h. p. "Olds" distillate engine; one 20 h. p. "Muncie" oil engine; one water well drilling rig; one wooden wagon running gear. The above used machinery may be priced at our shop. Will be sold at a very low figure. Dunn Manufacturing Co., Oxnard, Cal.

**REMANUFACTURED PIPE**  
All sizes, standard pipe and wrought iron screw casing. All kinds of fittings. Guaranteed good as new. Write for prices.

WEISSBAUM PIPE WORKS.  
169 Eleventh St., San Francisco.

**For Sale or Exchange**—One 30-60 Hart-Parr tractor; one 6-14 in. bottom tractor plow, good repair, price \$1650. Consider horses, mules, lots or acreage. See machinery at BRILES, 216 N. Los Angeles Street, Los Angeles, or address Box 125, Upland, California.

**Gasoline Engines**, the largest stock of used gas engines in California from 2 h. p. to 100. Thoroughly overhauled. Machinery Exchange, 733 North Spring St., Los Angeles.

**To Swap**—Fine rooming house, 8 rooms on Olive street, Los Angeles, always rented. Want ranch tools, pump, engine, pipe. Address Box M, Care Cultivator.

**For Sale**—One Byron Jackson vertical Centrifugal Pump No. 4. Newly bab-bited, shaft, frame and pulley, complete. A bargain. Box 306, Colton, California.

**For Sale**—Almost new Ford tractor attachment. 135 So. Los Angeles St., Los Angeles.

## CATTLE

**SHORTHORN CATTLE, SHROPSHIRE SHEEP, Berkshire Hogs and Shetland Ponies.** Get our prices and descriptions before buying. Butte City Ranch, Box C, Butte City, Glenn Co., Cal. W. P. Dwyer and W. S. Guilford, Owners.

**Pedigreed Bull Calves**, Registered \$50.00, unregistered \$25.00. Service bulls \$75 and up. Good individuals from producers. Cows with yearly records at a profit, tuberculin tested. Write or come and select. Horses. N. H. Locke Co., Lockeford, California.

**Registered Holstein Bulls** from high producing dams for sale at reasonable prices. Also a few choice females. McAlister Sons, Chino, Cal.

**Venadera Jerseys**, the herd with official yearly records. Calves of both sexes for sale. Guy H. Miller, Route 1, Modesto, Cal.

**Ayrshires (registered)**—A few young bulls, heifers and cows in milk at a bargain for quick sale. A. MacMinn, Phoenix, Ariz.

**Sunshine Farm Jerseys**—Bulls from officially tested dams for sale. E. E. Greenough, Merced.

**For Sale**—One registered Guernsey bull four years old. Abram Marron, Jr., Box 10, Oceanside.

**Registered Holstein Bulls** of various ages for sale. Millbrae Dairy, Millbrae, Cal.

**Registered Jerseys**—1 yearling bull for sale. J. R. Carhart, Fullerton, Cal.

## AUTOMOBILE ACCESSORIES

Fords can burn half coal oil, all distillate, or cheapest gasoline, using our 1918 Carburetor; 34 miles per gallon guaranteed. Easy starting. Great power increase. Attach it yourself. Big profit selling for us. 30 days trial. Money back guarantee. Styles to fit any automobile. Air-Friction Carburetor Company, 313 Madison Street, Dayton, Ohio.

## GOATS

**Toggenburg Milch Goats**—Rae P. Williams, Federal Realty Building, Oakland, Cal.

## PIGEONS

**For Sale**—Belgian Carneaux, the big kind; must sell, \$1.00 per pair. Order now. C. O. D. E. Fleming, Riverside, California.

## ENGINES

**Several New and Slightly Used Engines,** ARNOTT & CO., Implements, 112 S. Los Angeles St., Los Angeles.

**For Sale**—One 15-20 Gas Pull Rumley engine, cost \$2000.00, will take \$1500.00. Abram Marron, Jr., Box 10, Oceanside.

## GEESSE

**Mammoth Geese**—I am booking orders for eggs from my mammoth geese at 25c each. Ship any time. Order all you want. PEA FOWLS—Still have a few pair of young pea fowls at \$10 per pair. Order now, they won't last long. Chas. McNeely, Alhambra, Cal.

## QUESTIONS AND ANSWERS

Continued from Page 545

hutch formerly occupied by a buck and feeding soaked peas once a day for three days, then skip three days, will be effective. Test does five days after mating. If does refuse they have probably bred. If after trying different bucks, no results, dispose of doe.—W. D. W.

## SUCCESS WITH TRACTOR

Continued from Page 526

mules. I doubled the capacity of the disk plow by adding another beam and disk to make a cut of 25 inches and doubled the single five foot disk harrow by getting half of an old ten foot disk harrow with good disks which I had cut in two, and with a plank head made at home we have a five foot double disk when we want it or a single disk when that is needed. I bought an extra section of spring tooth harrow, making three sections, or nine feet in width. I had used a three section spike tooth lever harrow 16 feet wide and did not increase that as it would be inconvenient to turn in an orchard. I also had a short pole put in the low wheeled wagon which we will use with the tractor to haul manure from the station a half mile away and use behind the auto to take the walnuts to the packing house. These repairs and betterments were made at a cost of \$73.50, without including some of Chester's work.

When we began work we found that distillate did not burn like gasoline and that we had to run the engine about 20 minutes on cold mornings and at noon before it would be hot enough to pull a load. Then too if a plow choked in the heavy growth of melilotus or in bunches of walnut leaves the engine was cool by the time the plow was ready and had to be heated again a few minutes. There was always more or less cleaning of spark plugs and valves, so I told Chester we would abandon the use of distillate and would use gasoline until we were sure we knew all about the tractor and the implements. Gasoline is costing some more but we have not had to clean a valve nor a spark plug, and the tractor is ready to begin work as soon as the engine is started, so more work is accomplished.

I did not expect the tractor to do impossible things nor to run without expense and told Chester I supposed he would wish the mules back several times before he learned all about the tractor. However after a term at the citrus experiment station tractor school he is getting on, and we are gradually finding out what we can do and what we had best not attempt.

The most of our troubles come from oversights, or from careless workmen in the factory, which I suppose is to be expected under present conditions, for example; last evening there was a small adjustment to be made in some oil pipes and when done Chester said, "There that is done. What will be next?" The next came this morning when an imperfectly fitted key in

the wheel on the steering shaft came loose and caused us to lose three and a half hours, taking apart and replacing, with a trip of two miles and back, together with the machinist's bill for 50 cents for fitting a new key—which should have cost nothing but carefulness at the factory. Our troubles are mostly of this kind and not great enough to ask the factory people to replace, but they are annoying and somewhat expensive because of delay.

We are using only the best of lubricating oils, such as I would use in a fine automobile. The first cost of this may be slightly more than the cheaper oils and greases but there is no economy in using cheap lubricants and following up with costly delays and heavy repair bills. I bought the best grease gun I could find and fitted it with one-eighth inch pipe. This we used on all the heavier bearings, having removed the small grease cups so the pipe can be screwed into the fitting which held the cup. The grease gun is used twice a day to completely fill the bearings and force the grit and dirt out of the bearings. The openings are then protected by one-eighth inch plugs to keep out grit. Chester also turns up the remaining cups twice before noon and twice after noon.

After all this you will want to know what we expect to accomplish in the way of saving over the use of mules. I find that we can get about eight hours tractor work done in a day and that we travel two miles per hour, which is a little faster than the average team will walk with a load. We do not have to stop in hot weather as the tractor works best when fairly hot. We can plow from four to four and one-half acres when we run an eight hour day with the tractor instead of two and one-half to three acres with the team in favorable weather. The cost of fuel and oil for the eight hours tractor work is \$1.85, or less than 50 cents per acre, while the feed for the team at present prices, would cost \$2.80 per day, or nearly \$1.00 per acre. The tractor consumes nothing when not at work, but it costs about two-thirds as much to keep an idle horse as when at work, particularly when the horse has to be kept in condition for work. This extra feed cost adds very materially to the cost per acre of team work, though seldom considered. We can readily disk twice as much per day as with a team, particularly in hot weather, and while we may not get twice as many acres gone over with the cultivator we expect to do better work. I find we can plow closer to the trees than with two horses and can also get under the branches of orange trees with a disk harrow better than with a team since a little side draft does not make sore shoulders. However, a horse is a good thing to have on the place, and I have one to work in the short rows of a garden and put stops in checks for irrigation as well as other small jobs.

While I do not know of any perfect tractors, they are far enough along to be practical machines, and any one who has 40 acres of orchard or other intensive cultivation, should not hesitate about buying one as I believe that with such an acreage they can be made to pay for themselves in three years by the saving in expense of both man and horse power.

The man who has some natural mechanical ability will like the tractor best and will have less trouble in operating it than the man who knows or cares nothing about machinery.

## Live Oaks Dying

LL Southern California is concerned over the dying of branches of her most beautiful live oaks. Some trees appeared a few weeks ago to be entirely dead, but of these some are now putting out new growth and may possibly recover. It has been surmised that the trouble might be due to root or other fungus, to insects, or to the long rainless period of last season. George A. Coleman of the University of California has taken up the investigation, and from a preliminary statement made by him we quote:

While it will require considerable further study to determine the exact relation of all the insect pests and fungus diseases concerned in their death, and to arrive at the ultimate cause of the death of some trees, the preliminary examination shows that at least three species of bark boring beetles are mainly responsible. Of these, the one which is believed to be the start of the trouble is a twig girdler, the larva of which is found boring under the bark of the small twigs near the end and is the cause of the death of so many twigs on otherwise apparently healthy trees. As soon as these twigs begin to die another species of beetle attacks them and the larva is found boring into the heartwood. The attacks of these two beetles, when in sufficient numbers, causes the death of a large number of twigs, thus very much weakening the tree so that it cannot withstand the attacks of a third species, which, though it is the smallest of all, is the most numerous, and belongs to the Scolytidae, a genus of bark boring beetles very destructive to oaks. This third species, known under the scientific name of *Pityophthorus pubennis* Lec., normally breeds in recently cut oak wood, limbs broken off by storms, or in trees which are nearly dead from other causes. The entrance is made by the adult beetle, usually the female, through a hole in the bark, hardly larger than a good sized pin, and on reaching the cambium or sap carrying layer of wood just beneath the thick outside bark, the female makes a short transverse gallery in this soft layer, depositing her eggs in little notches along the edges. These eggs soon hatch into tiny larvae, which are very voracious feeders, and starting out at right angles to the parent gallery they soon make their way for a considerable distance from it, destroying the cambium, which is the life of the tree, as they go. When numerous enough, as they are at present, their entrance holes may be found covering the entire surface of the larger limbs, the entire body of the tree, and even the larger roots just beneath the ground. As their work of destruction is carried on underneath the bark, there is sometimes no outward sign of the death of a tree until the larvae have entirely covered, or at least entirely girdled the tree trunk just above the ground, which is its most vital point, the flow of sap being thereby entirely cut off, and the tree dies very suddenly. The entrance of these beetles may be discovered, however, by the appearance of numerous small discolored patches on the bark of the trunk and larger limbs, each of which marks the entrance of a beetle, the discoloration being caused by the flow of sap from the hole.

Where such a large area of territory is affected, it may seem a hope-

less task to undertake any treatment to save the trees. The fact, however, that these pests do not normally breed in a perfectly healthy tree, is of great assistance to us and points a way to the remedy. The probable reason for the appearance of these insects in such numbers, is that they have found a large number of neglected trees, fallen or cut limbs and trees cut for wood and left lying on the ground, furnishing the right condition for their breeding in immense numbers, until now they have become a menace to the living trees. It is believed also that a fungus which attacks the leaves and branches, and possibly other wood destroying fungi working on the trunk of the tree, may be responsible for the death of a few trees, which also furnish breeding places for the insects. This, however, is a matter for future study and consideration.

The fact that the entrance holes made by the beetles in the bark are so small, and are immediately closed, makes it an impossibility to reach them by means of a spray or fumigation after they are in the tree, the only possible chance of reaching them by these means being to catch the adults before they have entered the bark, or by treating the trees after they are dead and still contain the larvae and adults. It may be that further study will reveal some parasites and predacious enemies which will at least assist in their control. The immediate solution of the problem lies in the reduction of the number of beetles by the destruction of the larvae and adults while still under and in the bark of the dead and dying trees. In order to make this effective there should be cooperative action by the owners of the property on which the affected trees are found not only in the vicinity of Montecito, but all along the valley and Coast foothills on either side of Santa Barbara, and it might also be well to ask the cooperation of the United States forest service on the national forest, and of the state forester in compelling non-resident owners and negligent owners to clean up.

The most effective treatment to be followed at present is a campaign of cleaning up and burning all the dead branches and dead trees which are past recovery. If it is desirable to save the wood of dead limbs or trees, such limbs or trunks may be treated by building a fire of the smaller trunks containing the beetles and larvae on this fire, where they should be left for at least half an hour until the sap in the bark and wood becomes thoroughly heated and generates sufficient steam to kill all the larvae and adult beetles. This method was tried under the writer's direction and proved entirely successful. When carefully done every insect in the wood or bark will be killed. All stumps should be either dug out and so treated, or have the earth dug away from them so as to expose the larger roots and have a fire built on top of them. This will take care of the small beetle which works on the larger branches and trunk and is responsible for the immediate death of the trees, but in order to control the twig girdler, which is believed to be the first cause of the trouble, it will also be necessary to trim off and burn all of the dead twigs which are now so numerous on otherwise healthy trees. If a very valuable tree is found to be affected, but is still alive, and it is de-

sirable to save the tree, it should be well cut back, all the dead and dying limbs removed, and the tree stimulated by giving it plenty of water and even some fertilizer and cultivation.

This campaign of trimming and burning should start at once and be continued until thoroughly completed, as right now seems to be a very active time for the beetles in the trunk

and limbs, and the larvae of the twig girdlers are still mostly in the twigs while later they will have developed into the adult beetles and these will have gone to fresh twigs.

The writer hopes to be able to make a further study of the problem during the month of June, and to render further assistance in the matter of control.

## The Racing Homer--Its Uses in The Present War

Written for California Cultivator

By H. R. Sands

**T**HE "Racing Homer" called by most people "Carrier Pigeon" is a Belgian production and is a wonderful improvement over the old Carrier Pigeon. The Carrier is dependable to fly a distance of 100 miles, while the Homer has been known to fly over 1500 miles with as much dependence as the Carrier would 100 miles.

This wonderful bird is used to a very great extent in the battlefields of Europe and has been instrumental in saving thousands of lives since this means of communication has been re-

Game Cock

Game Cock is the property of H. R. Sands of Glendale, and is the first bird to fly over the hard mountainous and desert like course from Redding to Glendale, a distance of 500 miles air line same day. This remarkable pigeon covered the distance in 14 hours and 40 minutes, flying against a head wind, with heat in the San Joaquin Valley registering 120 degrees. It takes the fastest train on the Coast 24 hours to cover this distance. Game Cock is doing his "bit" by producing squeakers for Uncle Sam.

sorted to. In one instance alone a body of men numbering approximately 600 became isolated from the main army during an engagement. All hope had been abandoned by the majority of the heroic band, when one of the officers released two Homer pigeons which he had with him. In exactly 16 minutes from the time of liberation a barrage fire was lifted, enabling them to rejoin the main army.

The following is a brief narrative of the Homer from the date of its

birth up to and including its life on the battle front.

At the age of five or six days an aluminum band showing registered number, year of birth, and letters USA, is placed on the foot. The foot grows very rapidly, and in the course of a week it would be impossible to remove the band without injury to the foot. At the age of six weeks the "squeakers," as they are termed, are ready for shipment, and at the time of their arrival on the battle front they have attained the age of about eight or nine weeks. They are then placed in a loft fastened on a movable van situated out of gun range, generally near the commanding officers' quarters. The loft is equipped with a gas proof contrivance which is used when the occasion requires it. In a few days the birds are liberated, generally in the evening as they are not likely to stray any great distance from the loft during the late hours of the day. In a few days they have become thoroughly settled into their new surroundings. After a period of three or four weeks they are ready for their training and are taken a distance of about a mile, then two, five, ten, 20, 25 miles and are thus trained in all directions until they are familiar with what is expected of them.

At times it becomes necessary to move the loft as much as ten or 15 miles from the point at which it was at the time the bird was shipped for a flight, but in all cases they locate the loft as they soon learn to expect its removal after a time or two.

Messages are placed in a folding tube which is attached to the aluminum band on the leg of each bird. This tube will carry quite a lengthy message if finely written on tissue paper rolled very tightly before being placed in tube.

Aerial wire had to be abandoned for the use of the telephone on the battle fronts on account of the barrage fire; underground on account of shell fire; and wireless is out of the question as the enemy have gathered the message and this has been the cause of many casualties. As a last resort the Homer was tried and has triumphantly turned the trick to the extent that 97 per cent of the birds liberated deliver the messages.

## A Convenient Henhouse

Written for California Cultivator by Jean A. Koethen

**W**ELL equipped, conveniently arranged henhouses are an important factor in the profitable keeping of poultry. One man with modern conveniences can care for twice as many hens as two men without them. Of course these conveniences cost money, a handy man with a set of tools can do a good many things to make his work easier. The main thing is to see

clearly just what is required for the saving of steps.

S. J. Cotter of Arlington was for many years a mechanic. When circumstances forced him to exchange his chosen calling for the raising of hens his mechanical training taught him where to look for the best ways of lightening the poultryman's labor. He saw at once that the carrying in of feed and the carrying out of ma-

Remarkable Performance  
with Small Tractor

**B**EFORE you write out your check for any tractor, note how the Bean TrackPULL turns right around into the same row with tools down deep all the way, without pivoting, or overloading one side of the tractor, or doing anything else that is injurious, or difficult, or that a tractor shouldn't do. Note how this tractor takes its turn with its full load, just as easily at it takes the same load down the straight-away. Note the reason for this in this tractor's single track with which it pulls and you steer. See how easy it is to steer, and how that great PATENTED SINGLE TRACK FEATURE also makes the TrackPULL Tractor as flexible as the best team you ever had.

Bean TrackPULL  
Tractor With Patented  
Front-Drive

"Almost Like  
Animal Intelligence"

"Mine acts like it understood—almost animal intelligence." is the way one man puts it—and you'll want that, too, in a tractor. For ease of handling, as well as the ability to make right-about-face turns with full power, has got to be in the tractor you use in an orchard or vineyard or in the field, where there's a lot more than just straight-away work to do.

Be careful about "acrobat" tractors—for tractors that will spin around at a fair aren't necessarily tractors that will turn short with a full load in the field. Make them demonstrate to you with their tools hitched on.

Send right now for the Bean TrackPULL catalog, learn the price of this great machine, and get the name of the nearest factory-agent who will demonstrate how the Bean TrackPULL Tractor does the kind of work that's waiting for it on your place. Mail us this coupon, now before you forget it. Find out the truth about tractors right now!

lazy man would not have minded wasting time, but Mr. Cotter is neither robust nor lazy, and so he put in operation a device which is frequently recommended but rarely seen.

This device is a small car, perhaps four feet long, hung on a trolley which runs the length of his long laying house. This car can be run at two different levels, the one at a height convenient for the handling of feed, the other somewhat lower so that the manure from the droppings platform can be scraped off into it with a hoe. With this car, the cleaning of a 200-hen house and the replenishing of the feed hoppers takes but a few minutes.

Another helpful device of Mr. Cotter's is nests on hinges. Instead of the ordinary arrangement of nests in tiers along the front of the house, his nests are arranged in single tiers of six or seven and swung in under the droppings platform. Here they are dark and secluded while the hens are laying, but when time for gathering the eggs comes a single turn of the wrist swings them to the edge of the platform.

Mr. Cotter uses the regulation long house built in sections 20 by 24. According to the regular space allowance of, two feet for each Leghorn

hen, each section should hold but 200 hens. Mr. Cotter, however, has found that with the abundant scratching room provided in front of and under the droppings platform and the good-sized runs outside, 300 hens live very comfortably in one of them. The house fronts east and is entirely open in front except for a covering of two-inch wire. Such a house as this would be very suitable for a farm flock of 200 to 300 hens. Built a little smaller, say 42 by 16, or 14 by 14, it would furnish ample accommodations for 100 Leghorns or 75 Rocks or Orpingtons.

# FRUIT CROP REPORT

Continued from Page 531

J. B. Neff, Anaheim, Orange County

The season is so late that it is not possible to make an estimate of the apricot crop for some weeks.

Red Bluff Fruit Association, Tehama County

Apricots show a very light crop, frost having damaged 25 to 50 per cent. Peaches also are a light crop. The blossom was light and there was some frost damage. Probably will have half a crop. The almond crop will be about 75 per cent of normal. Cherry crop is probably not over 25 per cent. Prunes and pears show good prospect for full crop.

A. L. Rutherford, Horticultural Commissioner, Stanislaus County

Apricots 90 per cent, peaches 75, almonds 75, cherries 100, prunes 100.

Norman G. Buler, Horticultural Commissioner, Kern County

Apricots, peaches, almonds and prunes all show 100 per cent set of fruit.

William Gould, Horticultural Commissioner, Yolo County

Apricots 40 per cent, peaches 50, almonds 50, cherries 80, prunes 60.

J. M. Ballantyne, Acampo, San Joaquin County

Apricots 50 per cent, peaches 80, almonds 50, cherries, Royal Anne 80, Black Tartarian 50; prunes 75.

Chico Cured Fruit Association, Butte County

Indications are for 60 per cent crop of peaches, 40 per cent almonds, cherries and prunes 100 per cent.

(Many other valuable reports will be given next week.)

ticular type of tool, implement or tractor desired.

Near these exhibit tents was the parking ground for visitors' autos. It covered acres, and it was reported that at one time there were 2000 autos parked over these extensive grounds.

Across the street, and over the railroad, with a 100 acre field, along one side of which, in a straightaway line over a mile long were the private tents of the exhibitors. All the tents were alike and served simply as business offices for each demonstrator. A straightaway strip in front of each tent or concession was the private demonstration ground. The farmer had only to suggest his particular need and the tool he wished to handle with the tractor, and implement dealer and tractorman united in putting up a combination and demonstrating its power of working, and the prospective buyer had only to observe.

The afternoon public demonstration of plowing had an unfortunate feature in that it was on still another field two miles away. On this field each tractor was assigned a strip in width according to its horse power rating. Each plowed the same length of furrow and the same depth. Boys of the University Farm were official measurers, and they were everywhere with the official yardstick, and eight-inch depth must be reached or the operator of the plows was immediately called. Credit is due to the University Farm boys for much of the success of this demonstration. They acted as gate tenders, volunteer police, official measurers, and always did the general courtesy stunt.

A thrill was occasionally given by the long overland trains passing through the demonstration grounds at frequent intervals. The attention attracted by the passing train was only

momentary, unless it proved to be a special filled with boys in khaki. Each car window would be filled with two or three of the Sammies, waving arms and hats, cheering on the food producers, and the food producers in turn gave salute and a cheer as the boys sped on toward the trenches.

Some few of the impractical ones, but those who had an eye for beauty, looked with regret upon the acres on acres of gorgeous California poppies which were plowed under or crushed by the wheels of the great tractors. Every visitor to the grounds had one serious grouch, and it was justified. This was because of the feeding conveniences, or rather the lack of any provision for feeding such a throng. Those hot dog joints sure were fierce. At 15 cents per one small dust peppered dog between two Hooverized slices, believe me, there was conservation.

## The Ball Tread is the good roads of tractorodom

As the solid steel frame moves forward it glides on the two sets of enlarged ball bearings; glides easily—like an automobile on the solid highway.

The track, or tread shoes, over which the steel balls roll, does not move on the ground; it is the hard smooth surface—the highway over which the tractor glides so easily.

There is little friction, as these hard round balls roll in their annealed, cast steel ball race.

But a very small part of the power generated by the engine is required to propel the machine; the larger part is delivered at the draw-bar.

The track is self-cleaning. The tread shoes are so designed as to give the maximum tractive power.

What good roads have done for all the people, the Ball Tread Tractor is doing for the farmer—making it possible to plow deeper, plow more acres, cultivate in season, and produce larger crops. The Yuba Ball Tread Tractor is the highest example of mechanical skill, of engineering design, practical working features; and the ball tread is the key that opens the way.

The Ball Tread is as near to frictionless movement as engineering knowledge has yet produced.

The rigid steel frame allows no loss of power from the sagging of the upper parts of the endless ball tread.

Adapt this money-saving power to your problems. Plow deeper at less expense. Raise larger crops with less labor—the Yuba is a one-man outfit.

# EDITORIAL CORRESPONDENCE

Continued from Page 527

here nor is it standardized. But its power to do things has caused multitudes to stop and remark, "The world do move."

Hence tens of thousands gathered last week near the University Farm at Davis to view tractors in action, in action under nearly all kinds of conditions, directed by experts and even handled by novices. There were men drivers; there were women drivers.

There were none of the old-time steamers on the grounds, but practically every form of gas tractor was there. There were three sections to the demonstration grounds, or, rather, one field in which four mammoth tents were erected, these being filled with trucks, trailers, still exhibits of tractors, washing machines, spray pumps, irrigation supplies, seeders, pianos, ice making machines, rice threshers, bean threshers, iron water-troughs, autos, and all parts and accessories of autos, cylinder rings for gas engines, mammoth dump trucks, miniature silos, tents and camping outfits, oils and greases, and a thousand and one other things of use on a modern farm.

Not a blue ribbon was won by any of these diverse exhibits. It was not a fair; it was not intended as an educational exhibit, though of necessity it did educate; but it was one great sales making time. It was frankly understood to be a business proposition in which each member of the association was expected to do business, and he did it.

So far as observed, the truest of cooperative spirit prevailed, that is, where one dealer was unable to meet the needs of a possible purchaser, he was quickly referred to a business competitor who might have the par-

### DEFENDERS OF "THE SECOND LINE"

Plod on  
Old faithful team—  
Each step you take adown the field  
Removes a nation just one step  
From tyranny's control—the yield  
Of crops that follow in your wake,  
A nation's freedom helps to make—  
Old faithful team,  
Plod on.

Turn on  
Old faithful plow—  
Inanimate—yet what import  
Your work is to a nation's life  
And liberty! You build the fort  
Of food defense, while urgently  
The furrow whispers—anxiously—  
"Old faithful plow,  
Turn on."

Toil on  
Son of the soil—  
With steady stride—with singing heart  
From morn's pale light till setting sun—  
A privilege thus to do your part,  
Grudge not the perspiration's flow;  
'Tis part of freedom's debt you owe—  
Son of the soil,  
Toil on.

—H. M. Rahback.

### MOTHER'S LITTLE FLING

TELL you, I don't approve. I emphatically do not approve of Mother's traipsing about the country alone at her age."

Joshua Towles glared at his sister.

"Yes, Joshua, I know your sentiments. Woman's place is the home and that sort of thing," Eliza Bennett replied, "but Mother's done her fair share of staying. The fact remains that she's eating her heart out to see Charlie and her new grandson."

How's This for Barley, March 31?  
The boy, Howard Louis Bailey, is five years old and four feet high.

"If she'd just wait until spring, I could go with her."

"I said if she'd wait until autumn, I'd go, and she waited and here I am flat on my back—oh, yes, quite comfortable now, thank you! It isn't her 'duty' to stay with me. But when spring comes, you'd have to go North or South or East or West on business and Mother would be disappointed again.

"Don't be foolish, Joshua. You can take Mother to Chicago and put her on the train. She goes straight through without change and Charlie meets her at San Francisco. What's dangerous about that even for a woman of Mother's tender years?"

"Does Mother really want to go?"

"Ask her and see her eyes shine."

"When does she want to go?"

Joshua queried a little gruffly.

"Just as soon as I could persuade you to consent. How soon can you take her?"

"I have to go out to the mines next week and I can start her from Chicago if she can be ready."

"Ready! Mother can be ready in 24 hours. You go tell her and get your reward."

Mrs. Aschah Towles, mother of Joshua and Eliza and Charles, was not a demonstrative woman and therefore Joshua was completely surprised when she threw both arms about his neck and sobbed on his shoulder.

"Why, Mother!" he soothed her, patting her back awkwardly.

"I haven't seen Charlie for six years and his boy is my only grandchild," she murmured as she mopped her eyes.

"All right, Mother, I'll call for you on Wednesday. We'll wire Charlie when you leave Chicago and he'll meet you at the other end. If by any chance there should be a slip, take a cab to the St. Francis. I'll write the manager to take special care of you."

"Humph! Don't you worry one mite about me once I'm on that train for California."

Joshua Towles did worry, being rather given to that futile occupation. His mother looked so tiny and frail among the hurrying crowd in the Chicago station, that before he started to the mines, he wired his friend, manager of the St. Francis, to meet his mother's train. "Charlie might miss her in the crowd and it won't do any harm to have two of them on the lookout," he said to himself.

Meanwhile, Mrs. Aschah Towles sat in her Pullman seat and had it out with her conscience.

"It wasn't because you didn't want to worry Joshua, that you didn't tell him; it was because you knew he'd stop you," her conscience accused her.

"The ticket was bought and everything," she argued back, "and besides I wasn't going to be stopped, not this time," she added with a determined shake of her head. "I promised to wire as soon as I arrived but no telling when that will be," she smiled to herself a little grimly, "so perhaps I'd better begin a letter to Eliza. She's more understanding than Joshua."

But Mrs. Aschah found difficulty in explaining herself satisfactorily even to the more understanding Eliza.

"Charlie's letter came," she wrote, "while I was tying on my bonnet; and the ticket being bought and everything, I just didn't say anything to Joshua to worry him. But Charlie and Alice and little Godfrey have gone off camping and won't be back for a month. Joshua carefully explained that my ticket allows stop-overs at any point. All I need to do is to tell the conductor if I feel ill and get off at the nearest town where there's a hospital with good doctor and nurse. I shan't feel ill but I thought maybe I'd stop off and see my Cousin Abner's widow; and Sary Ann Wilson's daughter lives just the other side of Kansas City. I'd like to see if she's like her mother. Then ever since you and Joshua brought home those pictures of the Grand Canyon, I've wanted to see that awful chasm. So I just thought without worrying Joshua, I'd start out for California just the same."

"We've got a real nice friendly conductor and he says there's lots of things to see on the way out. You've got sense, Eliza, so I expect you to keep Joshua calm. I'll write you all along the way."

Eliza Bennett was far from calm herself as she read her mother's letter; then she lay back among her pillows chuckling to herself.

"Mother shall have her little fling. I guess a woman who raised Joshua and Charlie and me's entitled to it."

Two weeks later Joshua Towles burst into his sister's apartment.

"Eliza Bennett, do you know where Mother is? Be serious. Look at this." His hand trembled as he thrust under her eyes a telegram. "I've been tele-

## The Cultivator Patterns

8495

8759

8753

8526

8766

8755

8728—Ladies' Kimona Waist. Cut in sizes 36, 40 and 44 inches bust measure. This waist buttons at center back and the neck is cut square at the front.

8495—Children's Rompers. Cut in one size. The front is laced up to the throat with a colored tape and the kimona sleeves will allow the youngster plenty of freedom.

8753—Ladies' and Misses' Coat. Cut in sizes 16 and 18 years and 36, 38, 40 and 42 inches bust measure. This coat is a very simple model and will require very little fitting. The neck is finished with a long shawl collar.

8759—Girls' One Piece Dress. Cut in sizes 6, 8, 10, 12 and 14 years. The dress may be opened all the way down the center front, making it very easy to iron if the dress is made of wash material.

8526—Misses' and Girls' Apron. Cut in sizes 2, 4, 6, 8, 10, 12, 14 and 16 years. The lower part of the apron is slightly gathered to the sleeve part.

8766—Ladies' Combination. Cut in sizes 36, 38, 40 and 42 inches bust measure. The drawers are the open style and they are cut quite full; the lower section is joined to the upper at the hip line.

8755—Ladies' Four Gored Skirt. Cut in sizes 16 and 18 years and 26, 28, 30 and 32 inches waist measure. The side yokes are fitted to the figure and the lower side sections are gathered to the yokes.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. graphing back and forth for two days. Mother did not arrive in San Francisco. The manager of the St. Francis met her train; the conductor remembered a little old lady who left his train at some small station in Kansas. Charlie's camping and can't be reached. His stenographer remembers mailing a letter to Mother the day he left San Francisco. She couldn't have received it."

"Oh, yes, she did! I'm afraid you've raised your mother to deceive you, Joshua. Mother's itinerary is marked by that pile of picture post cards. The postmarks may be interesting to you."

"Eliza Bennett, have you lost your mind? I want to know where Mother is, now."

Concluded next week.

#### WAR-TIME RECIPES

"Sixty War-Time Recipes" is the title of a little booklet issued by the Home Economics Department of the University of Arizona. The aim of the department in collecting, testing and publishing these recipes is to substitute other grains for wheat, yet making nutritious and palatable dishes; to use as little fat as possible, and from vegetable rather than animal sources; to substitute karo syrup, honey or molasses for sugar; to substitute other protein foods for meat. We publish below a number of recipes for meat substitutes which will be found well worth trying. Every recipe we have seen published by the Arizona home economics department has been excellent. Others for bread, cake and pie making will be published in later issues.

#### Mock Sausages

Pick over one-half cup lima beans and soak over night in cold water to cover. Drain and cook in boiling, salted water until soft; then force through a puree strainer; there should be three-fourths cup pulp. Add one-third cup rolled dried bread crumbs, three tablespoons heavy cream or fat, a few grains pepper, one-fourth teaspoon salt, one-half teaspoon sage, and one egg beaten slightly. Shape in the form of sausages, dip in crumbs, egg and crumbs, and fry in deep fat or bake in a hot oven. Drain, arrange on serving dish and garnish with fried apple rings.

#### Pea Roast

Three-fourths cup bread crumbs, one-half cup canned pea pulp, one tablespoon sugar, four tablespoons English walnut meats, finely chopped, one egg, three-quarters teaspoon salt, one-eighth teaspoon pepper, one-quarter cup fat, three-quarters cup milk.

Break stale bread in pieces, dry in oven, and roll. There should be three-quarter cup bread crumbs. Drain canned peas, rinse thoroughly with cold water, put in saucepan, cover with cold water, bring to the boiling point and let boil three minutes. Drain and force through a puree strainer; there should be one-half cup pulp. Mix bread crumbs, pea pulp, sugar, nut meats, egg slightly beaten, salt, pepper, and milk. Turn into a small bread pan lined with paraffine paper, and let stand 15 minutes. Cover and bake in a slow oven 40 minutes. Remove to hot serving dish, and garnish with Spanish sauce.

#### Nut and Celery Loaf

Put through meat grinder together: one and one-half cup celery, one cup walnuts, add one-third cup dry crumbs, three-quarters teaspoon salt, pepper, one egg, one cup water to moisten. Mix and bake in moderate oven three-quarters hour; serve with tomato sauce.

#### Chili Red Beans with Cheese

Soak over night and cook until tender two cups red cooked beans, add three tablespoons fat, salt and chili sauce to make it taste right, water if necessary, and when very hot, one cup grated cheese. Take from heat, mix well and serve at once.

#### Tomato Toast

Brown two tablespoons fat, brown in it one to two tablespoons onions cut fine; then add two tablespoons flour, one-quarter cup peanut butter, one teaspoon salt, pepper, three cups tomato. Cook to thicken, season, and serve on squares of toast.

#### Chowder

One cup cooked peas, split, two cups corn, canned, one cup milk, one tablespoon of fat. Season with salt and pepper. Soak peas several hours, cook until soft, add corn and heat a few minutes, then add milk and fat.

#### Peanut Loaf

One cup peanuts, chopped; one-half cup rice, uncooked; two tablespoons butter, one-half cup milk, one egg, seasoning to taste. Cook the rice, add the other ingredients; bake in greased pan about 30 minutes. Serve with celery sauce.

#### Kidney Bean Stew

One cup kidney beans, one small onion, two tablespoons of rice, two cups canned tomatoes, two tablespoons pork or bacon or drippings, two tablespoons flour, salt and pepper to taste.

Soak beans over night in cold water to cover. In the morning place beans over fire, adding water to cover if necessary. Cook slowly until beans are soft. Then add the tomatoes, onions, rice and seasonings and simmer until the rice is very soft. There should be about a quart and a half of stew, and if there is not, add water. Mix the flour and fat, and use to thicken the stew.

#### Boston Roast

Two cups cooked beans; two cups cheese, one-half cup chopped nuts, one teaspoon salt, one-eighth teaspoon pepper.

Soft bread crumbs to shape into loaf. Bake 30 minutes in moderate oven. Baste with one tablespoon fat in one-quarter cup water. Serve with tomato sauce.

I am convinced that nothing so makes for the comfort of a farm home as good lighting. During winter evenings the room may be warm and comfortable but, if poorly lighted, it can not be homelike nor comfortable.

Life is so short; seems too bad we can't all have a lot of what we like. Yet what a happy faculty it is to be able to tune ourselves to our surroundings, to take what is at hand and let it be dear to us.

## It takes the fuss out of breakfast

THANKS to Ghirardelli's—breakfast-making is not the job it used to be. There's no fuss—no muss—no time lost.

If a chocolate pot does not happen to be handy—you use an ordinary stew-pan. It takes but a minute or two. And then—you have the most delicious of all food-beverages steaming hot, ready to serve.

An ideal blend of ideal foods—cocoa and pure sugar—Ghirardelli's supplies the maximum nutriment at minimum cost. Always keep a can on hand.

In  $\frac{1}{2}$  lb., 1 lb. and 3 lb. cans; a tablespoonful—one cent's worth—makes a cup.

D. GHIRARDELLI CO.

Since 1852

San Francisco

# Ghirardelli's Ground Chocolate

## Dependable for the whole route

—built to battle rough roads  
Horse Shoe tires make good

—and more than good.  
They have fought and won their way to being recognized as the tire of "mileage + economy."

## HORSE SHOE TIRES

For instance Horse Shoe Ford Non-Skids are guaranteed seventy-five hundred miles, but that's merely minimum mileage—the maximum mileage in Horse Shoes would seem incredible if it were not so repeatedly demonstrated in the experience of Horse Shoe owners.

## TRACKLAYER TRACTORS are SUPERIOR

THE man who purchases a product which he  
knows to be superior enjoys an extra sense of  
satisfaction. Purchasers of BEST tractors know  
that the BEST is superior. It has been demon-  
strated in farm and plantation work, and heavy  
hauling in the mountains and deserts throughout  
the world for many years as a superior product.

Scores of large concerns having had wide experience  
with various makes of tractors have standardized on  
the BEST.

For continuous service and increased net  
profits, buy the BEST.

**C. L. BEST GAS TRACTION CO.,** San Leandro, Cal.

C. L. Best, President. J. R. Buck, 2nd Vice Pres. and Treas.  
H. C. Montgomery, 1st V. Pres. and General Manager.

## Commercial Beans for Commerce

Plant the right variety in the right place:  
Pintos and Teparys away from the coast on mesa land, with or without irrigation.  
Hewitson Bush and Fordhook Limas on heavy or adobe soil.  
Limas and Blue Pod Navys on loam soil near the coast.  
Lady Washington on more sandy soil.  
Apply Westbrock to the seed when planted on sandy or loam soil.  
Plant only the New Mexican Pintos. We have a carload just received.

**AGGELER & MUSSER SEED CO.**

6th and Alameda Sts.

Los Angeles, Cal.

RICE

By agreement between the growers and millers of rice and the food administration, prices for California rice have been fixed as follows: Paddy rice, \$4.10 per 100 pounds to the growers; cleaned rice, \$7.10 per 100 pounds from the mills to the trade, and \$8.00 per 100 from jobbers and wholesalers to the retailers.

HAY

Under date of April 20, Scott, Wagner & Miller says:  
Receipts past week 307 tons. There has been a fair demand for strictly choice wheat or red oat hay, and a few cars of these grades have been placed to advantage, but the ordinary and poorer grades of hay have had to take care of themselves as no one seems to be in the market for them. Especially so is the case with stock hay. The stock men are buying practically nothing and whatever hay of this description arrives must be sacrificed as there is plenty of grass on the hills for feed purposes.  
Alfalfa is in good supply and is being offered for sale quite freely. First crop of alfalfa and in some sections a little volunteer hay is being cut so a carload is likely to be in evidence most any time on the market.  
There is no demand for straw.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market. For prices to consumers charges of cartage, commission and handling must be added according to conditions.

Citrus Fruit Market

Los Angeles, April 24, 1918.

The slight sag of some days is being covered, and better prices are being obtained. Valencia's are now topping the market. Some decay has been shown but most stock is going forward in good condition.

Lemons are not high but warm weather will soon give the market an upward trend and the big crop is promised a cordial reception.

Shipments

Shipments of oranges to date from Southern California since November 1, 1917: 5901 cars; lemons, 2068; total, 7869. To same date last season: Oranges, 19,729; lemons, 3394; total, 23,123. From Central California to date: Oranges, 2384; lemons, 115; total, 2499. To same date last season: Oranges, 4062; lemons, 164; total, 4226. From Northern California to date: Oranges, 203; last year same date, 844.

BERNSTEIN'S POLAND-CHINA SALE

Written for California Cultivator

The reduction sale of Poland-China hogs, held by W. Bernstein at Hanford, April 17, demonstrated the popularity of this well known herd. Sixty head sold for a total of \$4712, making an average of \$79.30 per head. The average was low because most of the animals sold were late fall pigs, but the older animals brought excellent prices.

The top boar was Young Jumbo, a son of R. H. Whitten's Jumbo Model, who went to W. L. Hoag & Son of Grangeville for \$400. They also secured a fine sow for \$125.

The next highest boar was King's Big Bone Leader, going to W. T. Dice of Fowler and Charles Gatewood & Son of Fresno for \$300.

The top sow, King's Rosebud 2nd, went to Mr. Dice for \$300. H. D. McCune secured a choice yearling sow in Rosebud Quality 1st, paying \$230, and A. Buckland & Son of Fresno took her litter mate at \$210.

Mrs. Leta L. Losleben of Visalia bought the largest number, securing nine head. H. N. Martin of Atwater purchased seven.

The other buyers included W. E. Martin, Visalia; W. L. Choisser, Riverdale; Howard C. Peterson, Reedley; F. E. Fay, Tipton; W. H. Richards, Visalia; Leo E. Hubbard, Lemoore; H. D. McCune, Lemoore; C. O. Gould, Carruthers; J. A. Raymond, Angiola; Walter C. Ficklin, Kerman; T. E. Cochran, Corcoran; J. Q. Martin, Atwater; G. B. Martin, Visalia; R. G. Hamblin, Kingsburg; A. J. Vanchif, Riverdale; M. M. Dyer, Chowchilla; and Dr. J. A. Crawshaw, William Hill, R. L. Waltz, John Bernstein, M. Bassett and F. V. Smith of Hanford.

An October gilt, donated by Mr. Bernstein to the Red Cross, was purchased by Dr. J. A. Crawshaw for \$72.50.

GERMAIN'S MOVES TO BIG NEW QUARTERS

The Germain Seed and Plant Company has leased spacious quarters on the first floor of the Kerckhoff Building at the northeast corner of Sixth and Main streets, Los Angeles, which will be occupied about July 1, exclusively by the retail department of the company. This department embraces vegetable and flower seeds, poultry supplies, insecticides, fertilizers and a nursery department limited to small vegetable plants and small ornamental trees and shrubs. The removal to Sixth and Main was made imperative by the wonderful growth of the business during the past five years. The present quarters at 326-330 South Main Street are greatly overcrowded.

The wholesale and jobbing business of the company will be conducted in large, specially arranged quarters in the Los Angeles Union Terminal Building. A space 127½ by 100 feet, and seven stories high, has been taken. The large seed experimental and trial grounds, and also the large nursery of the company on the Whittier road, will be maintained. The Germain Seed and Plant Company is one of the largest seed establishments in America. It was founded in 1871 by Eugene Germain, who was one of the early pioneers of Los Angeles.

Rip? Never!

You wouldn't expect your Boss of the Road Overalls to rip. You know better. The seams are so stoutly stitched that they last the life of the garment.

Other features you've come to like so well: big, swinging pockets—roomy but not baggy; hold-fast, patent buttons; reinforced strain points; extra full seat insuring comfort and ease; wide cut legs so you can pull 'em on over woolen pants. Altogether the best-wearing, best-fitting work garment you can get.

That's why it is *always* economy to buy Boss of the Road Overalls—a Neustadter product.

California Should Grow More Than 2,000,000 Bushels. It Will This Year. One Concern in This State Uses Monthly in Excess of 1000 Tons of Corn, Mostly Imported at \$11.00 Freight Per Ton.

# Model Bean Cultivator

Killefer Quality

Killefer Efficiency

This Cultivator, like most of our implements, has been developed at the request of Dealers and Ranchers for a strong, simply constructed cultivator, capable of doing their work deeper and better than possible with the light Eastern-made tools. The frame is one piece of high carbon steel without joints to work loose or sag and holds the wheels always true and in line with the rest of the machine. The double frame bar gives ample clearance between the standards and eliminates the tendency to clog in trashy ground. This frame bar has a double lifting device which holds it rigidly on both sides. A man's weight on the extreme end will not spring it out of line. The seat is set far enough back to give an unobstructed view of the rows and the foot control is very easy on the driver.

An important item for the Bean Growers' consideration is that all parts and repairs are easily and quickly obtained without the delay of sending East for them.

## Prevent Hog Cholera Losses

Feeds are High, Market is Strong, Demand is Insistent for More Pork. High Cost Feeds Will Not Permit Swine Disease Losses and Leave Profit. Clean Up the Cholera. The Serum-Virus Method is a Success

**I**N the live stock industry there is no disease more dreaded than hog cholera. It is so little understood, even after three-quarters of a century of history in this country, that the subject has but to be mentioned in scientific circles and a general discussion is quickly taken up. In fact, the name itself is said to be a misnomer, for as cholera is understood in human beings it is entirely different from the so-called hog cholera. Some scientists have in-

"The 13 years, from 1833 to 1845, inclusive, form a period of years in which but ten swine diseases, supposed by the writers to have been hog cholera, were mentioned in these replies. It is evident that during this period hogs were generally healthy throughout the country and that the losses from disease were not sufficient to attract much attention. The nature of the disease referred to as existing so long ago, may, of course, be questioned at this day, and we have no means of deciding whether or not

been issuing information in the form of bulletins and circulars for nearly a score of years. One of the first is Circular No. 3 by A. R. Ward, giving symptoms and instruction as to how the disease is spread. Other publications are Circulars No. 68, Prevention of Hog Cholera; No. 89, Hog Cholera and its Prevention, No. 106, Direction for Using Anti-Hog Cholera Serum, No. 132, When to Vaccinate, No. 176, Hog Cholera Prevention and the Serum Treatment; Bulletin 229, Cholera Prevention and Preventive Serum.

These may all be secured by request to Agricultural Experiment Station, University of California. In addition the United States department of agriculture has issued many bulletins and circulars touching every phase of this disease and its control, as have also the licensed commercial laboratories.

A word as to treatment. Unless the breeder has at least a measure of technical knowledge on the use of the needle and the nature of the disease and, in addition, is an extremely careful worker, treatment should be placed in the hands of a qualified veterinarian.

On this point the United States Live Stock Sanitary Association has resolved: "In our opinion serum should be used only by competent practicing veterinarians. The use of serum by farmers and incompetent laymen should be discouraged as far as possible."

Laboratories engaged in the manufacture of serum and virus are maintained by nearly every experiment station, but 90 per cent of the serum and virus used is produced by licensed laboratories which make it their entire business to supply these biological products. Their licenses are issued by the United States Bureau of Animal Industry, and the establishments are under the constant inspection of agents of the bureau.

Only indifference or negligence on the part of the swine breeder is the occasion for an outbreak of hog chol-

era in these days when every pound of pork possible should be produced.

Hog cholera serum has given to itself a bad name at times because of its lacking effectiveness or because of complications which have arisen after its use. For some time scientists have referred to sterilized serum, and some laboratories are now putting out both the ordinary type, or defibrinated blood known as bloody serum, and the sterile, germ-free type. We believe that a time will come when the government will insist on the marketing of sterile serum in inter-state trade, for it cannot control distribution in intra-state trade. It possesses very definite advantages over the other and these advantages are summarized by the Cutter laboratory, which is producing both kinds of serum, as follows:

1. Greater absorbability. The removal of all the solid constituents of the blood from the sterile product makes for rapid absorption. Slow absorption frequently produces discoloration of the meat around the site of injection, and if the animal should be killed before this absorption has completely taken place this discoloration would show in the dressed meat and affect the sale price.

2. The sterile serum is 20 per cent more effective, volume for volume, because of the elimination of those solid constituents that have no immunizing value.

3. The sterile serum has better keeping qualities for being sterile it cannot undergo change, and it can be kept for a period of about two years without being refrigerated.

4. It absolutely does away with the danger of abscesses, and abscesses incident to the use of an insterile or contaminated serum have the effect of stunting the animals and frequently destroying a whole ham. It is true that we have never had an abscess reported following the use of our defibrinated blood serum, but it is also true that abscesses have not uncommonly followed the use of insterile serum in the past.

Practical Hog Cholera Prevention

The administering of serum and virus calls for expert work. Be sure that your pigs are immunized by a man who thoroughly understands his work and the necessity for extreme care and cleanliness. Provide "trough" or bench for the young pig, which enables perfect control. Note iron band at lower left corner of engraving, under which pig's nose is put. Then, with two attendants, the pig is held perfectly quiet, while the operator can work with certainty.

isted upon "pig typhoid" as the more proper term. But the name has been so long and so generally applied that it will doubtless always remain.

When the disease was first noticed and described there was little agreement among medical men and veterinarians as to the cause, the means of dissemination, or as to whether there were not several different diseases included under the one term, hog cholera, as claimed by some, or whether there was one disease with different manifestations, as claimed by others, and the results of the earlier investigations of the disease by the modern methods of bacteriological research, conducted by the most competent authorities, were conflicting.

As to history, we note the following in the Fourth and Fifth Annual Reports of the Bureau of Animal Industry for the years 1887 and 1888.

"The first outbreak of the disease supposed to be hog cholera that is referred to occurred in Ohio in 1833. It was reported from one county in South Carolina in 1837 and from one in Georgia as having existed in 1838. It existed in 1840 in one county in Alabama, one in Florida, one in Illinois and one in Indiana. In 1843 it is reported from one county in North Carolina. In 1844 one county of New York reports being affected. Its presence in 1845 is only mentioned by one correspondent from Kentucky.

any particular outbreak was cholera or some non-contagious malady due to local conditions. It is reasonable to conclude, however, that the correspondents (from whom this information was gathered) were correct in their opinion in most cases, because, since 1845, the outbreaks mentioned became more numerous year by year until we find nearly the whole country involved. This rapid increase of the number of affected sections seems to indicate that a contagious disease had been introduced and carried to widely separated sections of the country from which it extended until, with a year favorable to its propagation, we find a sudden and alarming increase.

"Whether the outbreak which occurred in Ohio in 1833 was the first introduction of hog cholera in this country or not cannot now be determined. It seems reasonably certain, however, that the contagion was imported from Europe with some of the animals that were brought from there to improve our breeds of swine. Having once been introduced it spread gradually, following the lines of commerce and being a long time confined to them, until extending step by step, it has at one time or another invaded every section of the country in which swine raising is a prominent industry."

In this state the agricultural experiment station of the university has

Table with Syringes and Appliances

With clean paper cover and bottles conveniently arranged work of treating hogs is facilitated.

# Farm for Profit

## and Help U. S. Win the War

Authoritative tests have proved that as high as 50 per cent increase in crop production may be expected from proper use of fertilizer. Do you realize what that increase means? Fertilizer is the basis of crop production, and compared to the prices of the crops they help to produce, fertilizers were never so cheap as they are today.

## MORE CROPS

will be raised in America this year than ever before. Make every acre you own or rent, produce to the limit. Fertilize your land—the increase in yield and price of crops will more than pay all the fertilizer expense—it will enable you to farm with profit. Don't spend your time working worn out land. Make it pay—Fertilize with Hauser's Organic Fertilizer.

## Another Philippine Citrus Fruit

By P. J. Wester, Agricultural Adviser, Department of Mindanao and Sulu

**T**HE Philippines already hold first rank in the number of indigenous forms of the genus Citrus, several of which are additions to the citrus fruits, others being merely of botanical interest, and this very fact is a promise of discovery of still unrecorded species in the less explored regions of the Archipelago. Aside from a purely botanical point of view, new forms are at present also of great interest to the fruit grower and plant breeder as opening up new possibilities in hybridization, especially in connection with the problem of breeding new types resistant or immune to the citrus canker, *Pseudomonas citri* Hasse.

The "miaray" described and named below was found by the writer in August, 1917, in Impolutao in the interior of the Province of Bukidnon, Mindanao, at an elevation of 750 meters.

With its willowy, slender, drooping branches and dense crown of dark-green foliage, the miaray (pronounced meearay) is an exceedingly handsome ornamental tree. The fruit is about the size of a lime, not unlike an immature orange, usually growing singly in the axils of the leaves. It is pleasantly acid and may be used like the lime. The pubescence on the twigs is one of the interesting features of the miaray in a genus where nearly all species are glabrous. The foliage is more reminiscent of the mandarin than any other species and it is hoped that this apparently new form will prove as resistant to the citrus canker as the mandarin.

The clean, vigorous growth of the tree indicates that it is likely to prove a desirable stock for other cultivated varieties of the citrus fruits.

While too much reliance cannot be placed on this statement it is said by the native inhabitants in Impolutao that the miaray grows wild in the forests of Bukidnon, whence it has been brought under cultivation, and it is said to be grown in various other municipalities of the province. At any rate, the writer, who has devoted considerable time to the study of the Philippine citrus fruits, has never found this form in any other part of the Islands, and he believes it sufficiently distinct from all others to deserve rank as a separate species.

### Miaray

A handsome tree about six meters in height, with a dense crown of dark green foliage and slender, willowy, drooping branches; young growth pubescent, the hairs remaining on the twigs and the midrib beneath even some time after those attain maturity; spines small and rather weak frequently absent; leaves averaging 8 to 12 centimeters in length, rarely exceeding 16 centimeters, 35 rarely more than 55 millimeters wide, elliptical oblong or ovate to lanceolate somewhat undulate, more conspicuously crenate on apical half; base broadly acute; apex almost caudate slightly margined. Flowers not seen. Fruits axillary, usually solitary, rarely germinate, 32 to 38 millimeter long, 35 to 40 millimeters in equatorial diameter; form slightly oblate compressed toward base, flattened at apex, commonly with a slight circular depression around stigmatic area; skin medium thick, smooth, adhering to flesh; locules nearly always 10, very rarely 9, adherent to each other; juice cells rather small; flesh greenish gray, sharply but pleasantly acid rather recalling the lemon; juice quite abundant; seeds comparatively large.

## Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Sugar Beet Lime

In your issue of April 6 answering question "Lime or Lime Rock, Which is Best?" you state that sugar beet lime carries a very small proportion of phosphoric acid and humus material. I have been told by furnishers of sugar beet lime that it carries about the following: Organic matter six per cent, phosphoric acid .53 per cent, nitrogen .33 per cent, potash .56 per cent. Will you please state if an average analysis would contain about the above, and what might be average moisture content. How would price average in comparison with ground limestone?—Subscriber, Porterville.

This question was submitted to R. R. Snowden, who answers:

"The mineral content of sugar beet lime varies with the locality where the beets are grown. For instance, the lime produced at Huntington Beach will show different fertilizer

element percentages from that produced at Chino. This I think is due to different analysis of plants grown under different conditions of soil and tillage. In my judgment, unit for unit of actual lime, the sugar beet lime is worth 25 per cent more than the ground limestone on account of mechanical condition; but look out for the high moisture content in the former, which is often 30 per cent and more. To make a just comparison not only the moisture should be deducted, but the cost of freight and handling of this water should be taken into account, since this is large."

### Peanut Shucks or "Pops"

I don't think that you have given the correct answer to question as to peanut shucks, or as the peanut raisers of Virginia call them, "pops," on page 365 of the Cultivator of March 23. In the peanut sections of Virginia pops are laid to a shortage of lime in the soil and large quantities of lime

University Farm Picnic, 1918

One little section on the 800 acre farm of the University of California, in Yolo County. The Cultivator camera was located on the edge of the big administration building and looking down on thousands of automobiles and a few of the thousands of people attending this greatest of California farm gatherings. It may be noted that this picture is made up of three small photos.

## Modern Methods

The Ball Tread Tractor glides over hard steel balls like an automobile on the State Highway.

The Ball Tread rolls like engine wheels on the steel rails. Most of the power generated by the engine is delivered at the draw-bar. *There's a descriptive catalogue telling about it.*

## PIPE-PIPE

100,000 feet New and Second-hand Pipe and Casing.

Pipe—1/2, 3/4, 1, 1 1/2, 2, 2 1/2, 3, 3 1/2, 4, 4 1/2, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100, 101, 102, 103, 104, 105, 106, 107, 108, 109, 110, 111, 112, 113, 114, 115, 116, 117, 118, 119, 120, 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 198, 199, 200, 201, 202, 203, 204, 205, 206, 207, 208, 209, 210, 211, 212, 213, 214, 215, 216, 217, 218, 219, 220, 221, 222, 223, 224, 225, 226, 227, 228, 229, 230, 231, 232, 233, 234, 235, 236, 237, 238, 239, 240, 241, 242, 243, 244, 245, 246, 247, 248, 249, 250, 251, 252, 253, 254, 255, 256, 257, 258, 259, 260, 261, 262, 263, 264, 265, 266, 267, 268, 269, 270, 271, 272, 273, 274, 275, 276, 277, 278, 279, 280, 281, 282, 283, 284, 285, 286, 287, 288, 289, 290, 291, 292, 293, 294, 295, 296, 297, 298, 299, 300, 301, 302, 303, 304, 305, 306, 307, 308, 309, 310, 311, 312, 313, 314, 315, 316, 317, 318, 319, 320, 321, 322, 323, 324, 325, 326, 327, 328, 329, 330, 331, 332, 333, 334, 335, 336, 337, 338, 339, 340, 341, 342, 343, 344, 345, 346, 347, 348, 349, 350, 351, 352, 353, 354, 355, 356, 357, 358, 359, 360, 361, 362, 363, 364, 365, 366, 367, 368, 369, 370, 371, 372, 373, 374, 375, 376, 377, 378, 379, 380, 381, 382, 383, 384, 385, 386, 387, 388, 389, 390, 391, 392, 393, 394, 395, 396, 397, 398, 399, 400, 401, 402, 403, 404, 405, 406, 407, 408, 409, 410, 411, 412, 413, 414, 415, 416, 417, 418, 419, 420, 421, 422, 423, 424, 425, 426, 427, 428, 429, 430, 431, 432, 433, 434, 435, 436, 437, 438, 439, 440, 441, 442, 443, 444, 445, 446, 447, 448, 449, 450, 451, 452, 453, 454, 455, 456, 457, 458, 459, 460, 461, 462, 463, 464, 465, 466, 467, 468, 469, 470, 471, 472, 473, 474, 475, 476, 477, 478, 479, 480, 481, 482, 483, 484, 485, 486, 487, 488, 489, 490, 491, 492, 493, 494, 495, 496, 497, 498, 499, 500, 501, 502, 503, 504, 505, 506, 507, 508, 509, 510, 511, 512, 513, 514, 515, 516, 517, 518, 519, 520, 521, 522, 523, 524, 525, 526, 527, 528, 529, 530, 531, 532, 533, 534, 535, 536, 537, 538, 539, 540, 541, 542, 543, 544, 545, 546, 547, 548, 549, 550, 551, 552, 553, 554, 555, 556, 557, 558, 559, 560, 561, 562, 563, 564, 565, 566, 567, 568, 569, 570, 571, 572, 573, 574, 575, 576, 577, 578, 579, 580, 581, 582, 583, 584, 585, 586, 587, 588, 589, 590, 591, 592, 593, 594, 595, 596, 597, 598, 599, 600, 601, 602, 603, 604, 605, 606, 607, 608, 609, 610, 611, 612, 613, 614, 615, 616, 617, 618, 619, 620, 621, 622, 623, 624, 625, 626, 627, 628, 629, 630, 631, 632, 633, 634, 635, 636, 637, 638, 639, 640, 641, 642, 643, 644, 645, 646, 647, 648, 649, 650, 651, 652, 653, 654, 655, 656, 657, 658, 659, 660, 661, 662, 663, 664, 665, 666, 667, 668, 669, 670, 671, 672, 673, 674, 675, 676, 677, 678, 679, 680, 681, 682, 683, 684, 685, 686, 687, 688, 689, 690, 691, 692, 693, 694, 695, 696, 697, 698, 699, 700, 701, 702, 703, 704, 705, 706, 707, 708, 709, 710, 711, 712, 713, 714, 715, 716, 717, 718, 719, 720, 721, 722, 723, 724, 725, 726, 727, 728, 729, 730, 731, 732, 733, 734, 735, 736, 737, 738, 739, 740, 741, 742, 743, 744, 745, 746, 747, 748, 749, 750, 751, 752, 753, 754, 755, 756, 757, 758, 759, 760, 761, 762, 763, 764, 765, 766, 767, 768, 769, 770, 771, 772, 773, 774, 775, 776, 777, 778, 779, 780, 781, 782, 783, 784, 785, 786, 787, 788, 789, 790, 791, 792, 793, 794, 795, 796, 797, 798, 799, 800, 801, 802, 803, 804, 805, 806, 807, 808, 809, 810, 811, 812, 813, 814, 815, 816, 817, 818, 819, 820, 821, 822, 823, 824, 825, 826, 827, 828, 829, 830, 831, 832, 833, 834, 835, 836, 837, 838, 839, 840, 841, 842, 843, 844, 845, 846, 847, 848, 849, 850, 851, 852, 853, 854, 855, 856, 857, 858, 859, 860, 861, 862, 863, 864, 865, 866, 867, 868, 869, 870, 871, 872, 873, 874, 875, 876, 877, 878, 879, 880, 881, 882, 883, 884, 885, 886, 887, 888, 889, 890, 891, 892, 893, 894, 895, 896, 897, 898, 899, 900, 901, 902, 903, 904, 905, 906, 907, 908, 909, 910, 911, 912, 913, 914, 915, 916, 917, 918, 919, 920, 921, 922, 923, 924, 925, 926, 927, 928, 929, 930, 931, 932, 933, 934, 935, 936, 937, 938, 939, 940, 941, 942, 943, 944, 945, 946, 947, 948, 949, 950, 951, 952, 953, 954, 955, 956, 957, 958, 959, 960, 961, 962, 963, 964, 965, 966, 967, 968, 969, 970, 971, 972, 973, 974, 975, 976, 977, 978, 979, 980, 981, 982, 983, 984, 985, 986, 987, 988, 989, 990, 991, 992, 993, 994, 995, 996, 997, 998, 999, 1000.

Riveted Pipe—4, 6, 8, 10, 12, 14, 16, 18, 20 inch.  
All above pipe and casing is practically as good as new, with good threads and couplings on each joint. We also carry valves and fittings, pumps, engines, boilers and rail. See our stock and get prices before buying elsewhere.

**AMERICAN SURFACE PIPE**

or marl are used for growing the large nuts; also the lighter soils are used. The best crops I ever saw grown there were grown in a very drouthy year. I grew at the rate of 80 bushels, or 2400 pounds, per acre that year, and crops of 100 bushels of the large nuts were reported that year.

I have found that the small bunch or Spanish nut will grow and fill on almost any soil, and it is a much richer, more tender nut, contains more oil, is more easily digested and is the nut that is generally used for nut butter and salted peanuts. I have grown them here in San Diego County on uplands without irrigation and they filled perfectly. Last year a neighbor grew them with the large, or Virginia, nuts under irrigation, and while from 30 to 50 per cent of the large kind were pops the Spanish filled perfectly.

I raised in a young orange grove of one acre in the San Gabriel Valley 700 pounds of fine Spanish nuts planted after June 1st, and in that locality neighbors reported the large nuts a failure.

So you see it is more a case of growing the kinds that will do well on your soil, and the Spanish will succeed here in Southern California on all but the heavy clays, and they can be planted from March 15 to June 1. They should be planted and cultivated just as beans are, but care should be taken not to cultivate close to plants after they begin to set nuts.

We can all make our own nut butter and the peanut can be used in almost as many ways as cream or butter can.—A. F. Ames, Fallbrook.

### Water Glass

In the Cultivator of April 13 I read directions for preserving eggs in water glass. I have inquired at poultry supply houses but they say they never heard of any such thing. Please inform me where I can purchase water glass.—Subscriber, Etiwanda.

Water glass is the common name for sodium silicate and the one by which it is almost invariably ordered from druggists, grocers, or dealers in poultry supplies. Perhaps your dealers handle it under the former name.

### Residue from Acetylene Tank

We have an acetylene gas plant, Model B, in which we place calcium carbide into the feed generator. We buy 100 pounds. The residue is a white thick milky substance, and I would like to know if this substance can be put to any beneficial use.—Subscriber.

The residue has a value in that it is rich in lime and lime is valuable for most of our soils. Probably the better way would be to pour out in shallow pool and when dried it could be pulverized and scattered on the land. We have not heard of its being mixed with sand or soil before drying, but it is possible this would permit of easier pulverizing.

### TIMES CHANGE

With the sickle a man could harvest half an acre a day.

With the scythe a man could harvest one acre a day.

With the cradle a man could harvest two and a half acres a day.

With the first reaper (1831) a man could harvest six acres a day.

With the modern binder a man can harvest 20 acres a day.

With the modern tractor and two binders one man can harvest 40 acres a day.

California is now ranked as one of the cotton producing states of the Union. The entire output ginned in the United States in 1917 was 11,231,263 bales, of which California produced 56,810 bales. Texas is the big cotton grower; last year producing over 3,000,000 bales.

## Increase the Tractor's Value!

Use the tractor disk harrow that can take the place of a plow—gives greater acreage yields under all conditions.

QUICK AND ECONOMICAL TRANSPORTATION

## Nash Trucks Get Supplies Quickly

Nash trucks keep work moving on the farm by getting supplies from town most quickly. They double your loads and cut by half the time to town. And they are most dependable and economical.

Equipped with M & S automatic locking differentials Nash trucks are unusually suited to the farmer's needs. They get through where other trucks without this important feature cannot go. The driving wheels cannot spin. This saves fuel and tires.

They also have unusually strong internal gear drive axles. This type of axle is simpler, lighter and delivers more power to the driving wheels, especially at low engine speeds.

Nash trucks have many other superior mechanical features which our transportation expert will be glad to explain to you in detail.

## Fruit Crop Report

**S**INCE last issue some of our contributors have revised downward their first figures. Weather conditions not the most favorable at a critical time have slightly shaded former estimates. In the main California now has reasonable assurance of a good crop of deciduous fruit and nuts.

Aratus Everett, Moorpark, Ventura County

Since writing you a week ago the apricots in this vicinity have been dropping more than we anticipated. The crop will likely be from 60 to 75 per cent of normal instead of the former estimate I made to you of 100 per cent.

G. W. Harney, Horticultural Commissioner, Yuba County

Apricots 30 per cent, almonds 20, peaches and prunes normal.

Thompson Seedless grapes are showing enormous crop on old vines. Young vines seem to show some damage.

F. W. Waite, Horticultural Commissioner, Imperial County

Apricots show a 60 per cent crop, loss being caused by rain while in bloom.

A. Hancock, Bakersfield, Kern County

Apricots 90 per cent, peaches 95, almonds 90, prunes 90.

The fruit situation for Kern County is good. I believe all kinds of fruit are in good condition, and although they bloomed late are growing fast and catching up, and think will ripen about usual time. I have found only one thing less than full crop and that is the early apricots (Newcastle) but the late ones are very heavy. Medium ones good average crop. The prospects are really for a full crop but so as to err on the safe side I have placed it about 90 per cent.

Fred K. Howard, Commissioner of Horticulture, Kings County

Kindly revise recent crop estimate of apricot crop to read 75 per cent of normal.

E. S. Norton, Inspector Horticultural Commission, Sutter County

Making a rough guess at the true fruit outlook in Sutter County for the ensuing year. The almond crop has been estimated at 60 per cent of a normal crop; cherries promise nearly a full crop; peaches vary according to variety—some have a full crop, others are much lighter; apricots have set well, but there is a probability of many dropping later on; prunes have set well, but they are now in their critical stage, so it is not safe to report definitely on them just now. There are many conditions that may change the crop estimate later. But this is my best guess today.

F. C. Brosius, Horticultural Commissioner, Sacramento County

In re your inquiry for crop conditions at the present time, it is rather early, but the following is the estimated condition at this date: Apricots 90 per cent, peaches 75, almonds 85, cherries 90, all prunes 75, berries 100, pears 100. The heavy frosts the last of March was the cause of shortage of peaches and prunes.

D. D. Sharp, Horticultural Commissioner, Riverside County

Apricots 75 per cent, peaches 90, almonds 100, cherries 100, prunes 90.

M. Sharpe, Vacaville, Solano County

Apricots 50 per cent, peaches 75, almonds 50, cherries 125, prunes possibly 75.

J. W. Mills, Farm Adviser Solano County

Apricots are very spotted, some places being a full crop and other places less than half so you had better figure on about 60 per cent. Peaches are a full crop, almonds about 60 per cent. Cherries better than last year and prunes less than 50 per cent.

Geo. C. Nevins, Hemet, Riverside County

Our recent 'quake experience has so overshadowed our fruit interests that it is difficult to get back to orchard conditions. While most of the brick

buildings are ruined, and many of the chimneys of frame residences are on the ground, fruit trees are promising their best.

The apricot orchards that bore heavily last season will have only 50 to 60 per cent of a crop, but the many orchards that were shy last year are full (100 per cent), and the many young trees coming into bearing will more than make up for any shortage in some of the old orchards so we look for more cots than the Hemet region has ever before produced. Peaches will probably be good for more than 100 per cent of normal crop. Oranges are blooming full, and walnuts are good, older orchards, 80 to 90 per cent, and more young trees just beginning to fruit. No almonds, cherries, nor prunes grown here.

Lester C. Reed, Simi, Ventura County

## Macabee Gopher Trap

Small, simple, sure. At all dealers. If your dealer does not handle it, send 20 cents in stamps and mention your dealer's name and get sample by mail postage paid. Write for price in larger quantities delivered free by parcel post. Mfg. by Z. A. MACABEE, Los Gatos, Cal.

think 80 per cent of a normal crop a fair estimated for the Simi Valley. Some orchards have 100 per cent crops, while others which blossomed late have only 60 per cent. I have been in nearly every apricot section of the county and I find it all very much the same way. There has been a heavy drop due to some unknown cause, it being especially bad among the late blossoms.

Chamber of Commerce, Paso Robles, San Luis Obispo County

Apricots, peaches and almonds show a 75 per cent crop this year. Cherries

show a 100 per cent crop, and prunes indicate an 85 per cent crop this season.

A. A. Brock, Horticultural Commissioner, Ventura County

We now expect about 70 per cent of a normal apricot crop. In some sections there will be fully 100 per cent while in other sections it is very probable there will be 50 per cent. In fact in some orchards, so I have been informed by my inspectors, it is almost impossible to find a single cot.

I have no information of the peach, almond and cherry, which are all of minor importance in this county.

close early in May, open again early in July, and continue only until a need for the youngsters develops, as determined by a committee of farmers; when a six weeks vacation will be declared to permit the youngsters to work in the fruit harvest in the county.

One hundred fifty Napa business men have signed up to do a week's work in the fields whenever called upon, while St. Helena offers one hundred more. It is believed that these numbers can be doubled if the demand becomes pressing. A local labor exchange, run by the farm bureau, will carry ads in the local papers and already has a bulletin board at the court house posted with notices. Sixteen local agents report to the labor committee and form a network organization through the entire county.

Vacaville, early anticipating its coming needs, is arranging to hire a local man for labor generally, who will be charged with the organizing of two big camps to handle 100 people each. These are to be provided with showers and patent toilets, electric lights and other reasonable conveniences. These people fully realize to get good help and keep them, comfortable camps and conditions must be established.

Growers from Contra Costa County have arranged to meet the representatives of the San Francisco Y. M. C. A.

with a view to taking a camp of boys for their peak load season. Continued next week.

## Farm Help for the Coming Harvest

Written for California Cultivator By R. L. Adams, State Farm Labor Agent

The questions foremost in the minds of all who are interested in the farm labor situation for this season are:

1. Is there an actual shortage, and
2. If so, how is it to be met?

A survey conducted by my office during the months of February and March shows that a shortage above the supply of workers in sight may be expected to the extent of 12,000 men during August and September, — the "peak load" of farm labor demands in this state. Starting with a small shortage in February, the increasing demand for man power rapidly mounts to this figure of 12,000 for the two months given.

After September the need rapidly declines until an estimated shortage of 800 in December marks the low limit.

Any estimate of coming shortage is necessarily largely a matter of opinion since changes in weather conditions, demands by other industrial activities and increase of supply through unexpected sources will change the situation. These figures represent, however, the best opinion of men qualified to pass upon matters of this kind and too much emphasis cannot be placed upon the fact that a shortage is imminent and to meet this shortage everything must be done to result in the obtaining of additional workers.

As we see it, there are only two ways of meeting the situation. The first is by the better utilization of present available sources, and the other is by importation of labor from other countries.

Taking up the importation of labor, first, it may be said in passing that of all the countries investigated as a part of our 1917 work, that Mexico and China are the only two having a surplus. For reasons known to all, Mexico at the present time is the only one of these countries from which labor can be drawn.

By a working agreement with the United States department of labor and living up to their requirements, it is possible to obtain Mexicans but importation is expensive and beset with numerous difficulties. Even at that, some importation is in my opinion bound to be necessary for kinds of work and certain sections where our own people will not or cannot readily adapt themselves to conditions.

The only other method is better utilization of our available supplies. This includes the various movements to utilize more extensively women, high school boys, city dwellers, retired farmers and men now engaged in non-essential enterprises who can be released for farm work and other industrial occupations of a nature necessary to the conduct of the war.

Following a series of meetings scattered over the state, the situation seems to crystallize itself into two points of view. Railroads, farmers, and to some extent this office, are convinced that while much can be done toward better utilization of labor, some importation over and above this available labor is needed. Organized labor, guardians of public welfare, and many individuals, believe that the situation can be largely, if not wholly, met by redistribution and full use of the labor within our borders. That the matter must go through another season to demonstrate more clearly than has as yet been the case which opinion is correct, seems a foregone conclusion.

Certain it is, that extensive interest in the whole general use of labor

heretofore not seriously considered will be a part of the 1918 program and is beyond question.

Napa County has arranged to meet its harvest needs by

1. Arranging the school vacation to meet the harvest needs.
2. By voluntary agreement of business men to go out into the fields for one week's time whenever called upon.

The time of the school vacation has been so arranged that schools will

**This Sign has helped \$10,000,000 worth of "Z" Engines to sell over 150,000 farmers of America who demand the best for their money**

**LOOK FOR THE DEALER WHO DISPLAYS THIS SIGN**

They had seen all engines — they decided — and "Z" engines are proving the wisdom of their choice everywhere today on their work.

## 3 & 6 H.P. Use Economical Kerosene

Also Distillate — Coal Oil — Tops — Gasoline

—These 150,000 practical Farmers saw the advantages of the "Z" Built-in Magneto, everything complete, no batteries to fuss with or buy.

—They figured out the savings using Kerosene, at half the cost of gasoline, getting more than rated power in the "Z."

—They wanted the strength, simplicity and staunch durability of the "Z" Engine with its gun-barrel cylinder bore—its leak-proof compression—quick starting—low first cost—low upkeep—Fairbanks-Morse Quality.

—They bought on demonstrated performance in action—regardless of price to get the biggest dollar-for-dollar values per H. P. ever built into an engine. They acted wisely.

**The Service You Get When You Buy From Your Local Dealer**  
Your local dealer has just the type "Z" for your needs in stock—waiting for you. Buy from him. He is prepared to give prompt delivery and personal service right where you live.

**Fairbanks, Morse & Co., Chicago**  
Manufacturers

### Why Farmers Buy This Better Engine

1. Fairbanks-Morse Quality.
2. Economical in first and fuel cost, and low upkeep.
3. Simplicity and Staunch Durability.
4. Light-weight, Substantial, Fool-proof.
5. Gun Barrel Cylinder Bore.
6. Leak-proof Compression.
7. Complete with Built-in Magneto.
8. More than Rated Power.

**Don't think of Buying ANY Engine Till You See the "Z" in Action.**

## This Month in the Ornamental Garden Northern California

Written for California Cultivator By A. R. Gould

HERE has been quite a spell of hot weather during the month just passed, and the dry winds also helped to keep us very busy with the hose and we shall find it necessary to use the hoe and small cultivating tools to keep the surface of the flower beds in shape. Special care and attention should be given to the lawns just now, especially to those newly sown, as they must not be allowed to dry out and they should be kept very free from weeds. Those who are anxious to impart a fresh green appearance to their old lawn should apply an artificial manure. Never use farmyard manure unless you wish to introduce an endless crops of weeds.

### Planting Out

This term is full of meaning, and we wish to convey the fact that this month's work will be very important and will mean a gay garden if we utilize our space for planting showy annuals. The following should be planted during the month: Sunflower, large flowering and miniature grandiflora type; marigold, African tall and dwarf French types; dianthus, mixed; antirrhinums (snapdragons), in named varieties in solid beds of color; centaurea cyanus or cornflower and sweet sultan; cosmos, early varieties and the new double types, the latter being a great acquisition; gaillardia, double annual type; chrysanthemum coronarium, white and tricolor mixed; calliopsis, Golden Wave and the dwarf types, Tiger, Star, Beauty and Crimson King; candytuft, the giant hyacinth flowered form; zinnias in variety; stock, Ten-week and asters in solid colors, Comet and Crego's. The single type of asters are also very pretty.

See that the bed or border is fairly moist at the time of planting and choose the evening or early morning for the work. Keep the sprinkler going for some time after and satisfy yourself that the plants are put in firmly.

### Edging Plants

There is quite an assortment of edging plants, the most popular being

Golden Feather pyrethrum, lobelia, ageratum, violas, alyssum and echeveria. Some of these subjects are also used as a groundwork for some solid color effects. In fact we recently interplanted antirrhinum "Fiery Cross" with Ageratum Mauve Beauty, and should it so happen that the Antirrhinum or Snapdragon only gets a bad attack of "rust" and thus gives us only a short flowering season we shall remove it and still have a fine color display until frost. It is advisable to use some good judgment in selecting an edging for flower beds of solid colors, blue Lobelia would for instance go very well with a bed of white or rose pink asters, and it would also look well with deep yellow shades. Violas, blue, make an excellent edging to a bed of red roses. Echeverias are succulent plants and do very well in a dry situation; they are used mostly in formal or carpet bedding.

### Dahlias

The ground should have been well prepared for these and all tubers should be planted this month; also the young plants raised from seed. If you wish to propagate from a certain variety take the first shoots from the tuber when two inches or so in length and after making the "cutting" insert in sand where if kept moist it will root readily.

### Chrysanthemums

Cuttings of these should be placed in sand beds without delay and many rooted shoots can be taken from the old clumps of those grown last season. Some of the earlier varieties will require stakes towards the end of the month, this refers to the clumps of last season which are generally left in and will provide excellent cut flowers.

### Roses

Mildew and aphid or green fly are the two worst enemies of our roses this month. For the latter we can always recommend black leaf 40, a nicotine preparation used with an efficient sprayer. The former fungoid disease is generally due to sudden climatic

## VEGETABLE CHART FOR USE IN SOUTHERN CALIFORNIA

changes, and naturally those plants which are of a weakly nature and in an exposed situation generally suffer the most. There is generally the first wave of the disease which appears early in the spring when the young leaves are expanding and the second wave occurs generally a few months hence and attacks also the young wood. It is at this stage that winter spores are produced and perpetuated for another season. If the early spring attack is stamped out there is less danger of it becoming very severe on plants in an ordinary position.

Sulphur in dry or liquid form has been used effectively for several years and recently the writer has secured very excellent results by the use of

"Qua Sul," a liquid sulphur combined with a certain fertilizing agent. Rust, another troublesome fungoid disease, attacks certain varieties more than others and appears on the underside of the leaves. All infected leaves should be collected and burnt, and as soon as there is any indication of its appearance the plants should be sprayed with a solution of sulphate of copper. This should be used as a preventive.

#### Begonias

Of the tuberous there are now many choice types such as single, double, frilled, crested and pendulent. Secure tubers without delay and start them into growth in a warm shaded spot in boxes of leaf soil. Fibrous types may be planted out at once.

## This Month in the Vegetable Garden Southern California

Written for California Cultivator By D. F. Reichard

**I**T IS gratifying to see the number of war gardens well under way. It is imperative that they be carried through to full fruition. Every bit of food that can be grown in the dooryard garden and used is that much more left in the regular channels to be sent across the water to help fight our battles.

For those who have not their garden under way there is still time to prepare for summer crops. Wet the ground to be used thoroughly and work up by spading or plowing at least ten inches deep and pulverize. If there is a heavy growth of weeds on the piece clean them off because turning under so much roughage at this late date allows too much air space and the soil dries out before the young plants or seed that you put in could get well started. Roughage or green manure should be turned under while there is still enough time and natural moisture to decay it.

In the gardens that are going now the time to watch them closely for the enemies—aphis, slugs, weeds, miller and so forth; also see that the moisture is kept up so that the plants maintain a continuous steady growth.

At the first sign of aphis spray, especially on the under side of the foliage, with Black Leaf 40. For slugs snail and all chewing insects use arsenic poisons either as a spray or dust. As a preventive apply tobacco dust or slacked lime as soon as the seed comes up or the plants are set out. Weeds are controlled by vigorous use of hoe and cultivator. Millar and fungus disease remedies are Bordeaux mixture, lime-sulphur solution and sulphur, either applied as a spray or in the dry form by dusting. The control and eradication of these garden enemies is essential for the maximum returns from a garden and the maximum we must have this year. Cultivation helps materially in the control of pests as well as the all-important service of keeping the soil in condition for holding moisture and admitting air in proper quantities.

Seeds of all varieties of vegetables may be sown this month with success, excepting peas, turnips, cauliflower and cabbage which require cool conditions either as to climate or soil. This is especially a good time to start melons, squash, beans, corn, tomatoes and peppers, all of which require warm weather.

### Northern California

Written for California Cultivator  
By A. R. Gould

**W**E NOTE that appeals are still going forth to increase the food supply and where there is a water supply on hand there is really no excuse for anyone. There is still time to sow some war crops and many tons can be shipped to the Allies.

**Corn**  
Make an extended sowing of those varieties mentioned last month. Keep the cultivator at work amongst those plants which are some inches high.

**Peppers**  
Plant eggplant and Chinese Giant and Red Chili peppers in a warm situ-

ation and keep well watered for a few days and if possible shade the young plants.

#### Parsley

Thin out and transplant this month the strongest seedlings and plant six to eight inches apart.

#### Cucumbers

Thin these out in the mounds, leaving one or two plants to the mound. Never let these suffer for want of water and keep the soil well cultivated between the plants. If field cultivation is adopted they should be planted in rows four feet apart.

#### Squash, Muskmelon and Watermelon

These should be thinned out as advised for cucumbers and strict attention should be given to watering this month. Grow these well out in the open in the warmest situation you can find and remember that squash will keep quite a long time and are good stock feed, while a splendid preserve can be made from the Vegetable Marrow, when fully matured. Make an extensive planting of squash.

#### Potatoes

Keep the cultivator at work through the rows. Planting of the main crop should have been completed.

#### Tomatoes

Planting of these should also be completed this month, and as it is a fairly easy crop to grow and needs little attention after having become established in the field it should be largely grown. The San Jose Canner is the most popular commercial variety grown.

#### Leeks and Celery

Towards the end of the month the

young seedlings of these will be ready for planting out into prepared trenches. They should be planted six to eight inches apart in the trench.

#### Turnips

Make another sowing of Early Snowball variety.

#### Lettuce

Sow Los Angeles and Iceberg, the latter is noted for withstanding the hot weather.

#### Beans

Make successional sowings of those varieties mentioned last month. Our state is noted for its bean crops and there is still room for a large increase in production. It is a good war time crop and will also improve the soil wherever you plant it. A little grown but excellent shell bean for winter, is the White Creaseback. The Soya bean has of late years come rapidly to the front, and besides being very valuable for the oil it contains, a fine flour is made from it which has considerable food value. It is especially valuable to grow as an orchard crop as it produces abundant nodules on the roots and thus leaves considerable nitrogen in the soil. There are quite a number of varieties but the largest should be secured for general planting. Plant it this month extensively and give it a warm position.

## Test Special Belting

What a lot of chores there are to do.

There's the farm pumping plant, a busy, humming wheel, turned by the TEST SPECIAL belt, to bring up the water and send it on its useful course, raising crops and watering the animals.

TEST SPECIAL is the practical belting for the churn, the wood-yard saw, and the feed-mill, just as TEST SPECIAL is the dependable belting for the lighting plant, and for all the domestic needs.

Why buy a miserable, cheap belt which gives way and renders such poor service, when TEST SPECIAL is so reliable, so worthy of confidence, so sure to last and give years of permanent value?

If you will write us, giving details of your requirements, we'll be glad to furnish plans and specifications to help you decide how to get the best service, greatest efficiency and most economy out of TEST SPECIAL belting.

Protect belting from weather to insure longer life.

## THIS WEEK'S COVER

With a freight rate of \$11 per ton, and the demand in California for corn food products greater than ever, it is unfortunate that we grow so little of this wealth producer. This state does not produce one-tenth as much corn as does the little state of New Jersey, and New Jersey lacks a whole lot of being a corn-state. California's production per acre is greater than that of many of the regular corn states, and with the long season and irrigation possibilities the acreage should be far greater. The past three years has seen a material increase in corn production because of the campaign of the millers who are using thousands of tons monthly. The photo which appears on the cover of this issue shows how well corn does grow in Tulare County.

The equal of this may be seen in many another county in the state if one will open his eyes next fall. Let's produce more corn and pay less freight, especially at this time of congestion in transportation.

## OVER THE TOP

California and all the nation has raised more than its quota. There may be sections that will fall short, but we are glad to say that as a rule none of these are rural sections. A look over the returns from California shows that the sections that are the quickest to respond with the full, and sometimes over 100 per cent, quota have been agricultural counties or sections. Now comes thrift stamp day with all the country making plans for special observation May 6, next Monday. Boy Scouts are making preparation for this great day, and it is anticipated the state will roll up millions of dollars in purchase of war savings and thrift stamps.

## CHEER UP

The appeal has often been made to keep the boys at cantonments and in trenches cheered up with letters from home and from the old friends. This has been answered, at least as to quantity of mail, by such floods of letters that the postal department has appealed for relief so far as possible. The war department is also asking for relief from one type of letter which is sometimes sent to the boys. This is the type which has to do with the discouragements and gloomy things. A fellow confronted with the hardships which naturally accompany army life and doubtless with the ever-present longing to see and be with home folks, is not helped or made a better fighter by gloomy things in home letters. Let us pick out the cheering and better features of home life to write about, and especially the noble deeds and the sacrifices being made by the home folks that the forces in the field may be made more comfortable and more efficient. If there are slackers and wasters and indifferent or even pro-Germans, let us fight it out here at home. "Whatsoever things are true,

## FARM LOAN RESTRICTIONS

A Glenn County subscriber has written for our opinion as to the method of handling farm loans followed by the farm loan bank at Berkeley. We know that in a general way the bank has made many loans on California lands; likewise that it has felt compelled to withhold some loans. We have talked with some of the officials of the bank, and the embarrassment of the situation has been explained. In a word, this method of banking in the United States is absolutely new; there is no precedent, and the management is most desirous of making a complete success of this movement which should be of wonderful advantage to agricultural interests. One of the principal foundation stones of sound finance is stability, and we doubt not every successful banker has his bump of caution fully developed. The management of the federal farm loan, without the advantage of any similar movement in the past to guide them, are possibly a bit over-cautious. It is possible this caution may lead to stagnation, or the failure in development of some lands, which, if properly financed, might be successfully developed. But let our subscriber speak:

"As one of the appraisers for the local association I know that the land in question is good, fertile soil, that only needs irrigation and develop-

## Put Out the Fires!

Put out the fires! save the waste! save the pastures! save the water sheds! were ideas expressed in many ways at the fire prevention meeting held in Napa last Saturday. This county is surely organized and proposes to pass on its enthusiasm and organization benefits to all the state, hence to other counties.

The sweep of a blaze across one grain field can easily nullify the efforts of a thousand patriotic families in food conservation. The Germans would gladly expend a thousand shells to effect as much damage. If submarines dealt as great a loss, Berlin might exultantly chronicle the fact.

whatsoever things are honest, whatsoever things are just, whatsoever things are pure, whatsoever things are lovely, whatsoever things are of good report; if there be any virtue and if there be any praise, think on these things."

## ORANGES BY WATER

A subscriber and oranger grower asks of the Cultivator as to the probability of some of the ships now building on the Pacific Coast being commissioned to carry California citrus fruits and other products to Atlantic Coast consumers. Present indications are that the citrus fruit crop next season will be one of the state's greatest. Trees are in excellent condition, and blooming has been heavy. It is a hardy prophet, however, who will make definite prediction this early in the season. More, it is a hardy prophet who will predict the direction of travel of our Pacific-made steamships. These are not days for fulfillment of prophecy, so we can only express a wish, and that is that the world's traffic may be so arranged that shipments may be made by way of the canal. This matter will rest, however, entirely with the board at Washington where only world necessities are considered. It may be noted that Southern California had hoped to send the first of the completed vessels of the now-building Liberty Fleet, direct to France and Belgium, with a free will offering of the entire shipload to the hungry kiddies of those two countries. The shipping board has not as yet seen its way to give permission for such use of the vessels, but America is building vessels as never before, and perhaps by the time the next crop of oranges is ripe our carrying capacity may be increased so rail transportation may be relieved of some of its burden.

ment to double in value. The land now sells at \$75 to \$90 per acre. As the main expense of development comes at the beginning, installment of pumping plant, etc., and as that was the purpose of the applications, it does not seem as if the bank was quite fair in this matter. If they feel that the value of the land is not sufficient they should allow a smaller loan."

To the application the Berkeley bank replied:

"Upon looking at the report of the appraiser we discover that you have not yet developed your irrigation system."

"We feel that we cannot make a loan upon your land until such time as you have made an effort to develop the system and your land has been prepared for irrigation. A 40 acre area of dry land we do not feel to be sufficient to make a loan upon."

"Under the ruling of the farm loan board we feel it would be impossible to comply with your request to make a loan for the development of water until you have gone some distance yourself in this regard. We would advise you strongly to get started in this direction and sometime later on renew your application to this bank."

Now, we have driven over that portion of Glenn County in which these lands are located. They are not far from that district of Orland where the government reclamation service considered lands well worth changing the advancement of a large sum of money in order to form a federal reclamation district. Those lands have proved wonderful producers, and we believe that there is not a single settler who has lapsed on his payments, and, frankly, if we had the decision in the matter of loaning on these lands, and the loan was to be used in carrying water to them and if closer inspection had confirmed our present belief, we would have considered them a worthy and a safe investment. We believe the time will come when the federal farm loan board will feel safe in advancing money on lands which its caution now prevents.

The board is handling other peoples money. Bonds are to be sold to provide the coin for other loans. Those bonds must be kept at par. Careful management and prompt interest payments will do it.

## This Week's War Notes

Troops, formerly the National Guard of California, are reported to be on the way to France.

R. S. Golstein, convicted of producing a seditious photo-play, Spirit of '76, has been sentenced in Los Angeles to ten years imprisonment and \$5000 fine.

A movement for efficiency, or at least the cutting of a vast amount of red tape, is indicated by the appointment of Chas. M. Schwab, the head of the great steel manufacturing interests, to have entire charge of ship building and of John D. Ryan, former copper king, to have entire direction of the army's great aircraft production program.

It appeared early in the week that a break might be made between Germany and Holland. German troops massed along the frontier and certain demands as to transportation through Holland and the furnishing to Germany of certain supplies were made, which Holland refused. Later dispatches intimate that Holland has conceded most of the Teuton demands. During the contention German papers calling Holland's attention to the fate of Belgium were largely circulated through Holland.

Secretary Baker's appreciation of the size of the job America has taken is shown by claims made in Washington that he will appear before the military committee and make an appeal for an army of at least 7,000,000 men. In both army and navy there are now about 2,000,000. If the present war plans are carried out it will mean the assembling and drilling of 5,000,000 more. A year ago the total forces of the United States aggregated approximately 160,000. Secretary Baker will ask that draft age be raised to 40. A new draft is anticipated providing for two units of 500,000 each.

The most spectacular and thrilling event of the week has been the attack of the British navy under the leadership of Vice-admiral Sir Roger Keyes, on the ports of Ostend and Zeebrugge. H. M. S. Vindictive, with several torpedo boat destroyers and submarines, together with cruisers loaded with cement, entered the harbors, destroyed immense quantities of stores and supplies, marines remaining more than an hour at their destructive work, and sank the cement laden cruisers in the mouth of the harbors so as to seriously interfere with the use of the harbors as submarine supply bases.

The Teuton army is reported as again marching on Petrograd with an ultimatum to Russia that it will be captured unless all able-bodied German prisoners are released and returned to Germany at once and all invalid Germans given care under direction of physicians from neutral countries. In return Germany agrees to release all invalid Russian prisoners which she holds and to retain and "employ" all able-bodied Russians. There have been rumors of counter revolutions, one in particular claimed to be engineered by German sympathizers, aiming to put on the throne Alexis, son of the former emperor, under the regency of Grand Duke Michael Alexandrovich.

The fiercest of the fight on the Flanders and French front has been back and forth around the city of Ypres which as we go to press is nearly surrounded. The Allies are making a wonderful fight; the resistance on Monday being declared the bitterest since the drive which began March 21. The policy with the Allied troops has been to make strenuous resistance and sacrifice as few men as possible. The Sammies are now definitely located on the line east of Amiens and are known to control a section of several miles, both as to artillery and infantry. They are repeatedly attacked but have maintained their line. French troops have recaptured Locre near Kemmel and some other points of strategic value. It is rumored there will soon be 40,000 Chinese troops in France. The long range gun continues the bombardment of Paris, without material result, however. The line south of Verdun has repulsed some severe attacks by the Germans. In upper Alsace Germans were defeated and many prisoners taken. One factor in German operations in the use of tanks modeled on the English tank.

# Agricultural News Notes of the Pacific Coast

## Northern California

Last year's wheat is being rapidly cleaned up from all warehouses.

Butte County will plant 30,000 acres of rice, which is 10,000 greater than last year.

Rice planting is much later than usual, partly because of shortage of tractor supply.

Wheat being held by California farmers is soon to be requisitioned by the food commissioner.

The Feather River is "scouring," and shippers are hoping that it may again become a navigable river.

Butte County rice planting is late but the acreage will be 30,000 which is 10,000 more than any preceding year.

Merritt is urging every wheat grower to refrain from cutting wheat for hay and grow every possible bushel of grain.

The city council of Auburn, Placer County, has repealed its ordinance forbidding the keeping of pigs within the city limits.

Farmers of Placer County met at Auburn last Tuesday for the purpose of organizing a farmers mutual insurance society.

Napa County is making preparation for the utilization of pupils of the public schools in the solving of the strenuous labor problem.

The rice growers have sent a man to Washington to secure a revision of the excess profits tax so as to give justice to the land renter.

"What is better than a pig on a farm?" is answered by the farm bureau of Eldorado County with "Two pigs," which is their slogan.

An orange grower of Palermo, Butte County, is installing orchard heaters which give more heat and less smoke than any heretofore used.

Farmers of Irrigation District Number 108 in the Sacramento Valley will produce this year about 5000 acres of wheat and about 40,000 acres of barley.

Federal Food Commissioner Merritt has taken entire charge of the fishing industry of the state under orders from the food administrator at Washington.

Master Frank L. Hunt of the California State Grange has written to every member in California and urged subscriptions and fullest support to Third Liberty Loan.

Eldorado County farm bureau is planning a good roads day, squirrel extermination week, many valuable center meetings, and sent an immense delegation to the University Farm picnic.

The biggest annual event in the Sacramento Valley is the picnic at the University Farm, Davis. It was estimated that the attendance last Saturday was in excess of 18,000 people.

May meetings of the Sacramento farm bureau are: May 1, Elverta; 2, Rio Linda; 3, Galt; 9, Elk Grove; 10, Arcade; 11, Picnic Del Paso Park; 13, Orangevale; 14, Fair Oaks; 15, Del Paso.

Yolo County rice producers have been in conference with members of the food administration and the food administration pledges itself to aid the rice growers in record production for Yolo County.

## Central California

Kern County is promised three big cotton gins.

Corcoran, Kings County, will plant 500 acres of cotton.

Riverbank, Stanislaus County, is the latest to plant rice.

Aromas, San Benito County, grange recently held its annual banquet.

Ripon farmers have contracted 500 acres of cantaloupes and 200 of peas.

The San Joaquin Valley was visited by a severe frost early in April, the severest since 1911.

The Valley Fruit Growers' Exchange has settled upon a maximum wage of \$4.00 per day without board.

Tulare County has decided to hold its annual Tulare County Citrus Fair some time in December in Visalia.

Cattlemen of Monterey County recently organized at King City. John L. Matthews was chosen president.

Nearly all the farmers in the Manteca section of San Joaquin County are growing tomatoes for canneries.

Cattlemen's meeting has been called for May 7 at Bakersfield; May 8 at Porterville in the forenoon, afternoon at Visalia.

Egyptian long staple cotton planters are finishing the campaign, though all admit the seed should have been in the ground prior to May 1.

Santa Clara County milk dealers have organized a milk bottle exchange, this exchange to be a clearing house where they may be returned to their owners.

May meetings of farm centers in Fresno County: Riverdale, May 2; Raisin, 6, 8:30 p. m.; Easton-Oleander, 9, 8:00 p. m.; Kerman, 10; Selma, 11; Monmouth, 13; Reedley, 15.

Santa Clara County farmers are organizing the United Farmers of Santa Clara County. It hopes to be in a position to permanently aid agricultural and horticultural interests.

Cotton growers recently have observed a planting demonstration in the Kearney Vineyard, Fresno. The San Joaquin Valley Egyptian Cotton Growers' Association has been organized.

The Foothill Orange Grove packing house near Porterville was recently destroyed by fire with a loss of \$25,000. The federal department of justice is investigating as it is feared the fire was of incendiary origin.

San Joaquin County farm bureau center meetings for May: Farmington, May 1; Lavelle, 3; Thornton, 6; Linden, 8; Douglas, 9; Tracy, 10; Lockeford, 13; Ripon, 16; Manteca, 17; directors meeting at Stockton, 11.

San Joaquin Valley bee keepers have organized the Central California Honey Products Cooperative Exchange. The five directors are: Willis Lynch of Stockton, F. W. Burtch, Mike Marony, H. M. King, M. C. Richter, all of Modesto. The place of business for the present will be Modesto.

The directors of the Kings County farm bureau passed unanimously the following resolution: "Therefore, be it resolved, that we enter our protest against the continued waste of food-stuffs in the manufacture of intoxicating liquors and also against the open saloon, it being the greatest menace to the production and conservation of food."

## Southern California

Los Angeles recently sent 800 men to Camp Lewis.

Alfalfa ranchers are cutting and delivering new crop.

The Navel shipping season has closed in several orange sections.

Stockholders of the Hemet Apricot Growers recently met and elected directors.

An Ontario pigeon fancier with a large number of homing pigeons has volunteered and been accepted in the signal reserve corps.

Imperial Valley's fat hog sale ranged from \$16.54 to \$17.10. The minimum price was only a shade below the ruling Kansas City prices on the same day.

Oxnard farm center is discussing siloing of beet tops, and another season some will try the European method of siloing in trenches and covering with straw and dirt.

A Los Angeles County sardine packer, because of request from the government, will make experimental packing of sardines in peanut oil instead of the usual olive oil.

The Imperial Valley Dairymen's Association held its first meeting at El Centro, April 15. After one week they have signed up a total of over 5000 cows or nearly one-third of the cows in the valley.

The committee of Riverside County producers in favor of a farm school in the south similar to the one at Davis are still in action and appealing for consideration of the interests of the southern end of the state.

The Imperial Valley Milk Producers' Association will hold barbecue and mass meeting at El Centro on April 15, with speakers from the northern associations, for the purpose of perfecting the organization.

Investigations as to the value of bees in orange groves have been made by various bee keepers of the southern end of the state, and it is now claimed that where bees are abundant, even with Navels, the production is greater.

The cow testing department of the Imperial County farm bureau shows 46 cows producing over 45 pounds butter fat for the month of March. Pretty, owned by A. Visser, Holtville, leads the list with a production of 66.2 pounds.

Imperial Valley irrigators are concerned over a ruling of the war department in effect that unless the district elects to ultimately connect with the Laguna dam the department will withhold permission to place temporary weirs below Hanlon heading.

Two pigs fed by the Holtville High School Pig Club, six months old, and brought to the farm bureau auction sale at El Centro, weighed 505 pounds. Twenty-one others averaged 184 pounds after four months feeding by the school children. Dr. Crandall states that each of the children cleared about \$9.00 on his pig after deducting cost for feed and labor.

M. J. Pickering, from whose address on subsoiling we quoted April 20, informs us that we are seriously in error in locating La Habra in Los Angeles County. Orange County is proud of every inch of itself, and every resident has pride in being rightly located.

## The Coast and General

Day-old chicks may now be sent by mail.

Washington County, Idaho, has a fully organized farm bureau.

Hood River apple growers received over \$600,000 for last year's crop.

An immense bulk grain elevator is being constructed at Bates Siding, Oregon.

A careful canvass of the food situation in Washington, D. C. shows a 76 per cent increase over 1913 prices.

Beet growers of Walla Walla, Washington, and other nearby points will increase their acreage to 18,000, this largely because of \$10 price.

Live stock breeders of Montrose, Colorado, have agreed to give pure bred cow and calf to every soldier who enlists from that section.

Vegetable growers of Cuba and the Isle of Pines are concerned over the shortage of shipping facilities and fear the industry may be ruined.

Tillamook County, Oregon, recently held a Jersey sale at which one bull sold for \$1700, one cow for \$850, and the average of the sale was \$340.

Range stockmen of Arizona are adapting portions of their ranges to general farming. The campaign is on to make each ranch self supporting so far as possible.

State Horticultural Inspector Graham of Idaho reports serious injury to neither prunes nor apples by the recent frosts. Peaches have been seriously harmed.

Maricopa County, Arizona, dairymen have asked the national food commission that the price of milk in the Salt River Valley be fixed to cover cost of production.

Orange growers of Florida are making a campaign to have the leading varieties reduced to Parson Brown, Homosassas, Pineapple and Valencias.

Salt River Valley, Arizona, egg producers are organizing for the better marketing and storage of eggs. Facilities have already been secured for the storage of 600 cases of eggs.

The district horticultural inspector of Yakima, Washington, has been making extensive experiments in codling moth control. Excellent returns were shown from economical spraying conducted last year.

Louisiana will produce about 280,000 acres of sugar cane, this compared with 293,000 in 1917. This reduction is explained by the fact that growers have gone more largely into cotton, corn and rice.

The French ministry of war has reported favorably on a trial ration of seaweeds for horses. During part of the experiment seaweed was substituted entirely for oats. The horses increased in weight and general condition.

Definite arrangements are now made for an aerial mail service between Washington and New York, which will begin May 15, even the landing places at both ends having been provided for, and hangars are now building.

The Isle of Pines vegetable growers are compelled to suffer loss because of rains softening peppers and making it impossible for them to harvest crops ready for market, while the orange grove owners in the same island are highly gratified at the abundant rains.

*IT IS DUE to ourselves and to prospective users of Cutter's Anti-Hog Cholera Serum and Hog Cholera Virus to say that up to 1917 we had not produced either of these articles.*

*But it is also due to ourselves and prospective users to say that when we did start to produce them we had back of us twenty years of experience in producing serums and viruses for human and animal use, and in that respect we were better qualified to produce them than laboratories which, while they have been producing Anti-Hog Cholera Serum and Hog Cholera Virus for a few years, lack the experience in producing high-grade laboratory products that The Cutter Laboratory possesses.*

*This experience enabled us to plan, build, equip and conduct what is conceded to be the most up-to-date and best-equipped plant in the world for the production of Anti-Hog Cholera Serum and Hog Cholera Virus, a picture of which is reproduced on this page.*

*Our record of several million c.c. sold and used within the first year after production commenced, without one single complaint of bad results or lack of realization of expected good results, is also due to that same more than ordinary knowledge of the proper conduct of laboratory processes which our organization possesses.*

*This same laboratory (and field experience, too) leads us strongly to urge the use of Refined Germ-free Serum.*

*Measure for measure, a properly prepared, clear, sterile serum gives greater protection than the old type (defibrinated blood) serum does, because all the inert, solid constituents of the blood have been removed.*

*This refining process does not remove any of the immunity-producing substances.*

*It is the same type of serum as Diphtheria and Tetanus Antitoxic Serums (the "Globulin" type is not referred to in this connection), and one might just as well argue for the use of a contaminated Anti-Diphtheritic Serum as to argue for the use of the old defibrinated blood type of Anti-Hog Cholera Serum.*

*There is only one valid argument for the old type of serum, it is cheaper to produce and can therefore be sold for less.*

*But this is offset by the greater absorbability of the Refined Serum, its freedom from the possibility of abscess formation and discoloration of the flesh at point of injection, and its 20 per cent greater potency.*

# CUTTER'S REFINED ANTI-HOG CHOLERA

Produced and

## The Cutter

Berkeley

"THE LABORATORY"

A General View of One of the Largest and the Most Up-to-date

### PRICE LIST

Cutter's Refined Germ-free Anti-Hog Cholera Serum is supplied in 50 c.c., 250 c.c., and 500 c.c. bottles, at 2½ cents per c.c. This low price was made to popularize this superior product. We pay express charges.

Cutter's Defibrinated Blood Type of Anti-Hog Cholera Serum is supplied in appropriate size bottles at 1½ cents per c.c. This is the best serum of this type that can possibly be produced. We pay express charges.

Hog Cholera Virus for use with either type of Serum is supplied in 50 c.c. bottles at 1½ cents per c.c. We pay express charges.

Let your Veterinarian order for you, and encourage him to be liberal in estimating the amount of serum to use. There is always some wastage, besides, safety lies in giving more than may be needed rather than in trying to figure too fine.

# GERM-FREE SERUM

License by

## Laboratory

California

AT KNOWS HOW"

Best-Equipped Anti-Hog Cholera Serum Plants in the World

Should your Veterinarian be prejudiced in favor of some other serum, there is probably a reason that concerns him but not you, but it should make you more insistent that Cutter's Serum be used. Insist on Cutter's and order direct from us should you have trouble getting it. We ship, day or night, by earliest prepaid express.

Correspondence is solicited with veterinarians and stockmen who are interested in our new Germ-free Blackleg Filtrate and Anthrax Vaccine, and also from those having stock in Anthrax infected districts. Cutter's Anti-Anthrax Serum and Anthrax Spore Vaccine make stock raising safe in such districts.

Our new plant for the production of Anthrax Vaccine and Anti-Anthrax Serum is the largest and best equipped plant in the world devoted exclusively to the production of these two articles.

WHENEVER any producer seriously argues that the old type serum is equal to or better than the clear, sterile serum, talks glibly of the danger of "filtering out the immune bodies," set it down that either he is not equipped to produce the clear, sterile serum, or he is trying to cover his ignorance of serum values with a camouflage of words.

We produce both types of serum, and our defibrinated blood (old type) serum is the best that can possibly be produced, but the sooner veterinarians and hog raisers switch over to the use of the refined germ-free, the sooner will they be in line with the advice and practice of the best authorities.

We advise, too, that while the hog raiser should know enough about vaccination operations to be a judge as to whether they are being conducted right, he should nevertheless neither do the work himself nor trust Tom, Dick and Harry.

Get a competent veterinarian, his every-day experience with the hypodermic syringe and ordinary surgical technique beat theoretical knowledge or the knowledge that comes from only occasional practice.

A good veterinarian, like a good physician, is worthy of his hire, and in the skillful handling of vaccination operations he more than saves what his fees amount to.

We have just issued a special pamphlet giving the latest in the theory and practice of proper procedure in the administration of serum and virus and the proper handling of animals before, during and after vaccination.

It was intended more particularly for the veterinarian, but it should also be in the hands of every hog raiser.

If the hog raiser reads it carefully he will know that he is not qualified or prepared to be anything but a lay helper in properly conducted work; but he will also know whether the operator is really up-to-date in his conceptions and practice.

Write for this pamphlet giving "Special and Detailed Information Concerning Hog Cholera Immunization," also for booklet, "Hog Cholera Prevention."

Whether the old or the new type serum is used, stockmen should insist on the use of Cutter's Serum and Virus, because they are made by "The Laboratory That Knows How," and in not one single instance have they failed to give satisfactory results.

Owners of purebred swine should insist that Cutter's Refined Germ-free Serum be used. For it is "penny wise and pound foolish" to pay big prices for purebred boars and sows and then trust the lives of their progeny to the old type serum when for a few cents more per dose a safe and absolutely germ-free serum may be used.

## The ACME Cutter

The same Acme Cutter that fills your silo can be used to your profit at all seasons of the year in CUTTING DRY FEED and MAKING ALFALFA MEAL.

### Cut Your Dry Feed

10 per cent to 20 per cent of the bulk hay fed to stock is WASTED. Part is trampled under foot. The coarse hay is noded out and not eaten. Alfalfa is worth \$30.00 per ton. The average waste is 15 per cent or \$4.50 per ton. Avoid this loss by running your hay through an Acme Cutter. Make your hay go farther—feed more cattle. **HOW MANY TONS OF ALFALFA WILL YOU FEED THIS YEAR?**

The Light Running Acme is an all steel frame machine. Built in SEVEN SIZES. Would you like the catalog and sample of alfalfa meal?

### North San Joaquin Breeders First Consignment Sale

**50 REGISTERED HOLSTEINS 50**

At Miller's Stables, 11th and G Sts.

**Modesto, California, Thursday, May 9, 1918**

Remember that this sale is made up of choice consignments from reputable breeders, J. W. Benoit, Modesto, selling practically his entire milking herd, Gotshall & Magruder selling a large number of good cows and heifers, R. L. Holmes selling a pair of beautiful young cows, H. E. Cornwell putting in a right good heifer that he doesn't want to sell at all, and J. A. Pelanda selling some good ones that are in prime shape to make money for their new owners right away.

DAIRYMEN, don't overlook the fact that there are six splendid young bulls in this sale, the kind you need to improve your herd.

Every animal guaranteed to be a breeder, tuberculin tested and sold subject to tuberculin retest, every animal pledged to absolute sale.

## Arizona Livestock

Written for California Cultivator By A. L. Spellmeyer

**A**RIZONA is relied upon for the bulk of the yearlings and stock cattle imported into California. Southern Utah and Nevada also furnish thousands of feeder steers, but the Arizona market and conditions generally in cattle, lambs and wool are more or less indicative of general prices and conditions.

This is written in early March, and by the time of publication prices and conditions may be changed, as there seem indications of a temporary slackening market on yearlings and steers, a high lamb price, an advancing fat steer price, stronger pork prices and a sluggish wool demand, any or all of which may change very swiftly.

The usual buyers' slump is to be expected in cattle in April, especially feeders and stockers, but demand is so much greater than supply that before the deliveries in large volume commence prices are sure to be stronger.

There are in Arizona many buyers who have been taking all the yearlings, twos and threes they can get worth the money. Prices have ranged from \$35 for southern and light cattle up to \$37.50 for the better grades and \$40 for the best yearlings. No authentic \$45 sales have been reported. Twos and threes are in big demand at \$10 to \$15 for twos over the yearling price. No great demand has developed for stockers, cows or heifers as yet.

Apparently Central and Northern Arizona are already closely contracted as I have been through the state recently and ran across a number of buyers who had not been able to fill their needs. There are a few thousand yearlings left in the Kirkland-Prescott country at \$36 to \$38, also a limited number unsold in the Verde country. In the Globe vicinity the steers have been closely contracted except one bunch of 2000 yearlings and 2000 cows which had not been sold ten days ago. These cows were sellers choice, which means old cows and were held at \$40. There were some good cows also for sale held at \$50. Calves are figured about \$20 extra on the average. Most of the Apache reservation spring deliveries are already contracted. Our own outfit sold a bunch of good twos and threes to a Bishop, California, man at \$60, and we can get \$40 for our yearlings any time. We have offered a bunch of twos, heifers and young cows with calves, at \$50 for good heifers and \$60 for top grade Hereford young cows and heifers and \$20 extra

for calves at side, but no contracts were closed. We offered a bunch of big old cows at \$45 and \$20 extra for calves, with no takers, as the best old cow offer we drew was \$37.50, which of course was by a speculator who figured on a big profit. Therefore no stock cattle or definite cow price seems established in Arizona, and although there is \$100 cow and calf talk there is no action to justify such a price.

From the returns of the old cows and young canners shipped lately to Kansas City it is very probable that every surplus cow sold from Arizona will go East for the meat tins, as some light Southern cows brought \$48 to \$56, which would not have sold on the local Western market higher than \$30 to \$40.

It seems a waste and pity for many thousands of good young breeding stock to go into killing pens, and it seems out of proportion that a cow is apparently worth on the Western market hardly more than its increase for one year. There will probably be less than 20,000 good cows sold this year in Arizona, and what are sold are on account of the limits set by reservation and forest permits and forced turning and cutting down. It would seem a good opportunity for the food administration to exercise a good word with the department of interior towards finding a place for good young breeding stock on some reservation, forest or national park range, for the war period, as no cattle owner cares to sell cows if he can find a place to run them.

The Snowflake-Holbrook associated cattle men are holding a bunch of some 2000 yearling steers of good bone and quality at \$40 for June and July delivery, and it seems reasonably certain unless \$40 or near it is realized they will be held over.

The Bainbridge steers at Phoenix sold without cut a month ago for \$11.60. A fine bunch of fed steers which will go close to 1600 pounds for the tops and over 1200 pounds for the tails and average over 1300 pounds is the Cowden bunch. It is expected from present Kansas City indications that this bunch will probably bring 13 to 14 cents net, and go East, as the Western packers seem backward and loath to go over 12 cents for beef. The Burnt Ranch near Phoenix is feeding a bunch of a thousand or so calves since last fall. They are a good bunch of dehorned calves which should come out nice and fat at about 700 pounds and bring a fancy price when fat. Feed has been so high it will take better than 12 cents to come out even on any fancy fed cattle.

## Milk Goats

A well known importer of live stock states that "the goat of Switzerland is the Swiss peasant's cow, the Swiss baby's foster mother, a blessing to the sanitariums for invalids, and a godsend to the poor," in England and in many other parts of Europe people who leave the city during the summer months, either for their country homes or for travel, often take a milk goat with them in order to insure a supply of good milk of uniform quality. In this country the fact that the goat will supply sufficient milk for the average family at low cost and can be kept where it is impossible to keep a cow, is beginning to appeal to many.

A doe that produces three pints a day is considered only a fair milker, while the production of two quarts is good, and the production of three quarts is considered as excellent. Goat's milk is nearly always pure white. The small size of the fat globules is one of its chief characteristics. In consequence the cream rises very slowly and never so thoroughly as in the case of cow's milk. If it is properly produced and handled, it will keep sweet as long as cow's milk, and there should not be any goaty odor. The milk can be utilized for the same purposes as cow's milk, but is less satisfactory for making butter and perhaps better for making cheese.

Feed for Goats

Goats should receive a liberal quan-

tity of succulent feed such as silage, mangel wurzels, carrots, rutabagas, parsnips, or turnips. The grain feeds best suited for their rations are corn, oats, bran, barley, and linseed oil meal or oil cake. A ration that has been used in the government herd, and which has proved to be very satisfactory for milk goats during the winter season, consists of two pounds of alfalfa or clover hay, one and one-half pounds of silage or turnips, and from one to two pounds of grain. The grain ration consisted of a mixture of 100 pounds corn, 100 pounds oats, 50 pounds bran, and ten pounds linseed oil meal. All feed offered the goats should be clean and of good quality. Plenty of rock salt should be kept before them, and occasionally a small quantity of fine salt mixed with the grain feed. A good supply of fresh water is necessary.

### ANNUAL MEETING OF GUERNSEY CATTLE CLUB

The annual meeting of the American Guernsey Cattle Club will be held at the Auditorium Hotel, Chicago, Illinois, Wednesday, May 15, 1918, at 10:30 a. m. The business of the meeting will consist of: Report of the year's work of the club's office; recommendation of the executive committee; election of officers.

America is slowly but surely lining up for a lasting peace at any price.

## MORE RANGE THROWN OPEN

Thousands of Head in National Forests in 1918

As a war measure, the national forests of California carried in 1917 a total of 49,010 head of sheep and goats and 10,970 cattle, horses and

swine in excess of the numbers carried during 1916. Feeling, however, that the grazing resources of the national forests should, during this emergency, be utilized to their utmost, Assistant District Forester C. E. Rachford, in charge of the grazing work for the forest service in California, arranged last spring for the services of eight grazing experts. These men were assigned to an examination of the national forests to determine what should be done in water development and other range improvements in order to make available every possible acre of national forest range for California's cattle and sheep.

Based upon their inspections and the reports of the forest supervisors, it is estimated that the national forests of California are capable of supporting a further increase of 162,265 sheep and goats and 39,878 cattle, horses and swine, by the time all the range improvement work contemplated has been completed.

It is hoped, according to Acting District Forester Headley, that sufficient range improvement work can be done so that 1918 will see an addition over 1917 of some 87,000 sheep and goats and 16,000 cattle, horses and swine. If the work progresses satisfactorily, and the desired increase is obtained, this will represent for the past two years an increase of 32 per cent in sheep and goats, and nearly 13 per cent in cattle, horses and swine.

### MANURE A NECESSITY

Another Reason Why You Should Keep a Few Pigs or Chickens

Farm Adviser Carl Williams writes that in traveling over Sacramento County he has noted numerous orchards badly in need of organic matter but in which there are no cover crops, either natural or artificial, growing. He adds:

"How can an orchardist expect to get a good crop of fruit from land that is so dead a cover crop won't grow on it? No matter what he expects it is a sure thing he won't get it. The only way to rebuild the soil of such an orchard is by manure. Manure must be applied first before a cover crop will grow. Manure and proper cover crops with lime will bring this land back to its original productiveness. You can't buy manure, either the price is too high or you can't get it. Therefore, keep some livestock and produce it. No man has a right to call himself a farmer who plays a trick like that on nature and gets away with it."

### CATTLEMEN'S MEETINGS

A series of meetings of cattlemen of California in conjunction with members of the federal live stock commission and of the United States forest service have been held at many points in California. One held in Los Angeles last Friday, while not largely attended, brought together a bunch of representative cattlemen, and Assistant District Forester Rachford made address outlining efforts which the forest service is making to aid in greater beef and mutton production. President Nares of the California Cattlemen's Association also spoke of the willingness of the cattlemen to aid in every way. The question of markets was referred to as calling for some attention, and representative packers, Frank Hauser and Mr. Kelly, representing two large Coast packing house interests, expressed their desire to aid. Chairman True of the federal live stock commission was not present at the Los Angeles meeting, but so far as he can command his time is assisting in the campaign.

### VENTURA WILL IMPROVE LIMAS

The Lima Bean Growers' Association is backing County Agent Essig of Ventura in his work among members of the farm bureau along the line of selecting and improving bean seed. Systematic work will be undertaken by a large number of growers.

One festival day which has been consistently observed by one town in this state is May Day, observed by Dixon, Solano County. The festival this year instead of being held on May 1 was deferred until a more convenient date, May 4. Queen Dorothy extends to the Cultivator and all its readers hearty greetings.

## Calco Troughs

Raising hogs for profit demands sanitary and easily cleanable drinking and feeding troughs.

Calco Troughs—with round bottoms and smooth metal sides—are easily cleanable. Cross bars prevent hogs lying in troughs.

Made of rust-resisting Armco Iron and cast iron—strong, rigid, yet light.

The low cost covers years of use and service.

## For Calf Scours

B-K treatment is saving many calves. Scouring calves indicate a germ infection that is likely to run through your entire herd with serious losses.

The loss of one calf is bad enough, but nothing compared to your loss when the infection spreads—as it will unless checked. Then your year's work in building up your herd is wasted—your profits lost.

Leading breeders testify that B-K stops scours. It is powerful in killing germs. When used internally B-K kills the germs in the mouth, throat and digestive tract, heals inflamed membranes, relieves irritation. B-K may be given freely in drinking water.

If your dealer does not have B-K, send us his name.

FREE BULLETINS: Send for complete information—"Special trial offer" and our calf bulletin No. 136.

# PERFECTION MILKER

## The Labor Problem Solved

**ONE** man with a Perfection Milker can do the work of three men at milking time. In case of emergency your wife or your little boy or girl can do it.

The Perfection milks as the calf does—suction, downward squeeze, release. The Perfection is simple. It does not easily get out of order. No harness to bother with. The Perfection teat cup fits all sizes of teats. The pail is made of "Wear-Ever" aluminum, easy to clean and non-rusting.

L. C. Richards of Grand Forks, No. Dak., says:

"The Perfection Milker is doing fine. We milk 40 cows in an hour easily and the men like the work. With the present scarcity of help, I am afraid to think of what might happen if we did not have the Perfection."

C. E. Van Meter of Loveland, Col., says:

"The Perfection Milking Machine is giving entire satisfaction. We are saving one man's work with it on 20 cows, which will pay for the machine in 10 months."

Let the Perfection Milker relieve you of the labor problem and you will find that the world will seem much brighter.

Write for your free copy of our new illustrated catalog. You will find in it much valuable information.

## RECEIPTS AT STOCKYARDS IN MARCH

Receipts of cattle and hogs at stockyards in the United States during March of this year were greater than receipts in March, 1917, according to the monthly stockyards report issued today by the bureau of markets, United States department of agriculture. Receipts of cattle and hogs for the three months of 1918 exceed receipts for the same period in 1917.

March receipts at 56 yards were: Cattle, 1918, 1,688,029; 1917, 1,324,995; hogs, 1918, 4,372,136; 1917, 3,367,588; sheep, 1918, 1,223,120; 1917, 1,232,543.

**Total Shipments from Stockyards**  
Shipments of cattle, hogs and sheep from stockyards all showed increases during March, 1918, over March, 1917, and the first three months' total for cattle and hogs was greater in 1918 than in 1917. Total shipments for March, 1918, were: Cattle, 642,910; hogs, 1,707,170; sheep, 552,397. The March, 1917, figures were: Cattle, 469,187; hogs, 1,151,787; sheep, 439,840. Stocker and feeder shipments as a class, included in above figures, also showed increase in March, 1918, over March, 1917.

More cattle and hogs were slaughtered at 45 cities in March, 1918, than in March, 1917. The figures, giving 1918 totals first, were: Cattle, 997,115, 810,507; hogs, 2,625,400, 2,220,476; sheep, 653,783, 782,552.

Increased receipts and shipments of horses and mules at 43 cities are shown by the report, the March figures, with 1918 given first, were: Receipts, 117,768, 109,108; shipments, 114,076, 107,109.

## THE HOG OF TODAY

Written for California Cultivator by Walter E. Gatton

The history of the hog industry of the United States is of the most wonderful interest, not only in the enlargement of the enterprise, but in the improvement of type by careful breeding. It is safe to say that more improvement has been made by breeders of hogs than any other class of breeders. This progress dates from 1865 and shows a revolution in the standard of the various associations, so that instead of the old rough, slow growing hogs of long ago, we now have the vigorous, easy feeders, weighing from 150 to 250 pounds at six months of age, and many boars of various breeds weigh from 500 to 1000 pounds at from two to four years of age, and sows of the same age weigh from 300 to 750 pounds. These hogs go to flesh instead of lard, and thus make short and thrifty feeders. Moreover, the breeders of today are carefully selecting their breeding stock and the development is steadily increasing.

## Field Notes From the Live Stock Men

Eldorado Winifred, the senior two year old registered heifer that recently made official records of 25.15 pounds butter from 529.5 pounds milk in seven days has now completed her 30 day official test with a production of 2416.2 pounds milk and 99.02 pounds butter, averaging over 80 pounds milk per day for the period. She is owned by Alex Whaley, Tulare, who bred her, and who also bred her dam, Winifred Hotaling 3d, the 32.19 pound cow that sold for \$1750 in the Guaranty Sale.

Hollywood Farm, Hollywood, Washington, will consign six splendid animals from their herd of registered Holsteins to the great Milwaukee sale to be held in June following the annual meeting of the Holstein-Friesian Association of America.

The stocker and feeder market at Fort Worth, Texas, has strengthened slightly, following good rains, though the improvement is not so marked as yard traders anticipate it will be in a few days. There has not been a great deal of life in the stocker and feeder trade that recently has taken only the better grades, which have been scarce.

Market-ward movement of fat lambs and cattle from the Arkansas Valley of Colorado feeding district during the first 15 days of April amounted to 14,333 sheep and 1936 cattle, which practically equalled the number shipped during the last half of March. A total of 47,393 sheep and 10,499

## Duroc-Jersey Hogs AT IRELAND

Ranch at Owensmouth  
City Office: 1219 Brockman Bldg., Los Angeles  
Spring Boars by Orion Cherry King V (Reformer) For Sale

cattle was left on feed in the valley April 15. For the first time since January there were no reports of any cattle or sheep being taken off feed, due no doubt to an advancing market, the present tendency being toward keeping the stock in feed lots as long as possible.

Practically \$70,000 realized from carlot sales of hogs on the Omaha market since late in February has been turned over to local chapters of the Red Cross in the communities from which the hogs were contributed.

Our representative has just visited the L. A. Denker herd at Saugus and certainly saw some very fine Hampshires. Mr. Denker has about 30 fine brood sows and about 100 spring pigs. Director is at the head of his herd and now weighs close to the 1000 pound mark. Zodiac Wonder, the first prize under six months pig at the state fair last year, has developed into a first class prospect for the fall shows. He was bred by Mr. Denker and is a hog that any breeder would be proud to say he bred. Mr. Denker expects to show 22 head at Sacramento and about 65 or 70 head at the Liberty Show this fall. They are making their self feeders from the government plans and they are surely first class feeders.

Wm. J. Hanlon, an attorney, and Joseph Hurley, a civil engineer, are contemplating starting a fine herd of hogs in Los Angeles County. They have not definitely decided on what breed or exactly when, but it will be in the near future as they wish to make a big show this fall. They expect to get their entire herd from the best Eastern breeding.

The asylum at Patton recently purchased a few fine specimens of Hampshire hogs from the Llano Vista Rancho. They wish to experiment with these hogs along with the other breeds.

Fred Hughes, Los Angeles, has branched out into the greater industry, the hog business. Mr. Hughes selected for his choice the Hampshires, having bought a few extra fine animals from the Llano Vista Rancho of Perris.

A. J. Wallace of Sunland has started a nice herd of Hampshires, having bought his stock from the L. A. Denker herd. Mr. Wallace has certainly shown good judgment in his selections as he has some very fine specimens. His pigs were weaned at eight weeks and weighed 39 pounds, showing that Mr. Wallace also knows how to care for little pigs. He expects to have his pigs ready to show at the Liberty Show this fall.

Mr. Jamison of Tehachapi has just purchased 25 more bred Hampshire sows from the Conejo Ranch, which were shipped this week. Mr. Jamison is getting a very extensive herd of Hampshires, as this makes 75 brood sows recently purchased from the Conejo.

Mr. Kirkham of Zelzah purchased a fine lot of brood sows from the Conejo Ranch. There are some excellent sows in this herd.

Geo. A. Murphy reports sale of 11 Berkshire hogs to Thomas & Ettinger of Rio Vista.

#### Book Review

#### SOUTHERN PORK PRODUCTION

"Southern Pork Production," by P. V. Ewing, Texas agricultural experiment station, published by Orange Judd Company, New York; \$1.50 net.

As his title suggests, Professor Ewing's book fits itself to southern conditions. Special emphasis has been placed on the practical side of pork production. Southern hog growers have been freely consulted, and as Professor Ewing says in the preface "The farm press of the South has assisted materially in the preparation of the manuscript."

There are ten chapters touching upon economic aspects, principles, breeds, judging, showing, feeding, management, diseases and their control, marketing, and the last chapter is given to pork—its composition, as a food, slaughtering, classification, pork cuts, for home use, time of butchering, killing, scalding, scraping, etc.

The book opens with discussion of the importance of soil conservation and of the advantages offered by live-stock and especially hog growing in soil upbuilding. While the book is sectional to an extent, its 286 pages are so full of practical information that it is of value to every farm library.

**BESS BURKE ORMSBY**  
Minnesota has the honor of having a 40 pound cow. The pure bred Hol-

stein, Bess Burke Ormsby 203801, recently completed her test with the production of 42.31 pounds of butter

in seven days, the 28th pure bred Holstein cow that has yielded more than 40 pounds of butter in a week.

Bess Burke Ormsby

Bess Burke Ormsby has a record of 21.39 pounds of butter in seven days as a two year old with a yearly record of 856.46 pounds of butter made from 17,935.7 pounds of milk. Her next record was made at the age of four years, one month, at which time she yielded 29.32 pounds of butter from 553.1 pounds of milk in seven days. This time she freshened at two months over five years and her figures for the first seven days were 42.31 pounds of butter made from 558 pounds of milk. She is running very nicely and will be continued for a yearly mark. Her sire is Sir Pietertje Ormsby Mercedes 186784. Her dam is Spring Brook Bess Burke 98734. She was bred and is now owned by E. C. Schroeder, Moorhead, Minnesota.

The return ticket for our boys in France will be secured largely through American savings of wheat, sugar and fats.

## Facts you should know about the market for live stock and meat

*In Swift & Company's  
1918 Year Book. Sent FREE  
on request. Write for copy*

**T**HIS book presents, clearly and frankly, a study of live stock buying and meat selling—a description of the market conditions that determine the prices you get for your live stock.

It describes the producing and marketing steps from your farm to the table of the consumer. It explains also how the part played by Swift & Company enables you to obtain for your live stock the highest market figures.

The full value to you, of this part played by Swift & Company—how it affords you a ready cash market for your live stock, and how it passes along the meat products to the consumer on the lowest operating expense and profit and with highest efficiency—is shown in this book.

Write for your copy of Swift & Company's 1918 Year Book now—a postal will do. Every page presents facts that you as a stockman and farmer should know.

Address Swift & Company  
4127 Packers Avenue  
Union Stock Yards, Chicago

Swift & Company, U. S. A.

## Classified Liners

The direct selling method from producer to consumer, and a clearing house for over 31,000 readers, weekly.  
Liner rates: Single insertion 3c per word;  
yearly contracts 2½c per word; 35c per issue minimum charge.

### TREES

**For Sale to Nurserymen or Large Planters**—Owner of a large block of very fine Eureka Lemon trees will sacrifice at a ridiculously low price to those who will take a large quantity. These are not old dirty culled over stock, but strictly first class trees, clean, thrifty and straight, budded high on sour stock, never have been frosted or stunted in any way. Ground has to be vacated by June 1, so this stock will actually be sold at LESS THAN SEEDLINGS CAN BE RAISED. Address X, California Cultivator.

### AVOCADOS

The Spinks is easily the best variety that has fruited in California. It combines the good points of all the others with none of their defects. A rugged, prolific tree and a superb fruit. Field grown trees of this and other well known varieties, including the Rey, Linda, Sharpless, Fuerte, I. X. L., Caribou and others, \$3.00 to \$5.00 each. Liberal discount in quantities. W. A. Spinks, Duarte, California.

**For Sale**—Extra fine Valencia trees, ½ to 1½, all sour root, high buds, very thrifty, clean and straight, not fertilized, excellent soil for balling, nothing better grown. Can supply a limited acreage yet closing out entire lot of these fine trees. S. R. Coate, 564 S. Los Angeles St., Anaheim, Cal. Phone, Anaheim Pacific 403-J.

**Avocado Trees**, budded, Fuerte variety; a hardy, vigorous grower, bears a rich, delicious fruit. Eighty per cent of all avocado trees planted this year were of the Fuerte variety. Our trees are field grown, straight, symmetrical, with large balls. Send for illustrated, descriptive circular, showing prices. WEST INDIA GARDENS, Altadena, California.

**Here is Your Opportunity to Secure A-1 citrus trees.** We offer several thousand 2-year-old lemons; Eureka and Villa Franca, also Washington navel; also several hundred Valencias on sweet root. We call these good trees and we know whereof we speak. ALBERT JACKSON, Upland, California.

**By Far the Lowest Priced means of reaching a buyer for what you have to sell is through classified advertisements in California Cultivator.** The cost is only 3 cents per word per issue, with a minimum of 35 cents.

**100,000 Sour Orange Seedbed Trees**—50,000 sweet; choice new stock. Trees lined out this year sure to hit high market. Better plant a few thousand next spring. Southland Nurseries, 1941 East Colorado, Pasadena.

**Valencia Orange and Eureka Lemon trees** one year past, ¾ to 1 inch. Pedigreed stock on sour root, high buds. We will bud 6000 choice seedlings to your order. Seed bed stock for sale. Randall Bros. Nurseries, Whittier, Cal.

**For Sale**—About 25,000 uncultured lemons, Navel and Valencias of the very highest character of pedigreed stock must be removed at an early day from present location. Will sell in the field at 10 cents apiece. Apply John Hinkle, Lordsburg, California.

**Closing Out**—15,000 choice Orange and Lemon trees for sale. Marsh seedless grapefruit, Eureka lemons, Washington Navel and Valencias. Two year old buds, 30 cents each or in hundred lots 25 cents. F. A. Anderson, Elsinore, California.

3100 Oakland Av., Kansas City, Mo.  
3100 Empire Bldg., Pittsburgh, Pa.

## Three Rules for Raising Turkeys

Written for California Cultivator By Jean A. Koethen

THE baby turkey is an anomaly. Thoroughly domestic as it is in its habits, it is still undomesticated. Fonder than chickens of the barn yard and the back door step, it is essentially a creature of hill and forest. It eats out of the hand of its caretaker when it is three days old and is a victim more often than not of the very tenderness it has encouraged. Poor little turkey! It is wild and doesn't know it. Believing itself a really, truly member of the family, it trusts itself absolutely to the judgment and intelligence of its caretaker, and this very trust is its undoing.

Young chicks display a good deal more intelligence than turkeys in respect to what and when and how much they eat. No chick likes new dishes. No chick will touch a particle of food with which it is not familiar until the mother hen gives permission. If there is no mother hen it must be coaxed. Few chicks, if any, will overeat. If they have had all they need, food may stand before them all day and they will not taste it. With poult the case is just the opposite. For some reason hard to understand they are unable to digest as much as chicks yet they are always ready to eat, and they do eat till blackhead gets them.

This brings me to my first rule for the care of poults, which is, Never let them eat all they want.

Blackhead is a disease which nobody, I suppose, exactly understands, yet it kills probably half the poults that are hatched the country over and is the cause of 99 out of 100 of the natural deaths of turkeys. It is most severe when it attacks very young poults but more common among those from six weeks to three months of age. After turkeys are six months old they seem almost immune, yet we are told that adult birds often have the disease without showing it and go about scattering germs wherever they go. This seems a serious matter but is not so serious as it was once considered, for more recent investigations have shown that all turkeys, young and old, harbor the germs of blackhead, but that these germs do no harm unless they are developed by overeating. This, at least, is the theory of the latest bulletin of the Rhode Island station. The plain fact seems to be that the young turkey has a very sensitive liver. As long as this organ is not overworked the bird does very well no matter where it is or what it eats. As soon as it is overworked the microbes begin to get in their work, which shows in the spotted liver of a well developed case of blackhead.

When blackhead attacks very young poults they die very quickly, apparently of a severe diarrhoea. Birds six or eight weeks old will often live a week. They are droopy, lag behind the others when they are called to meals, and do not care to eat. The head takes on a peculiar paleness which has given rise to the name, blackhead. Diarrhoea may not be noticeable at first but is always present sooner or later.

From the little we really know about the disease it seems likely that its course is quite slow. A bird that has been overfed from the day it was hatched may show no symptoms of the disease for two, three or four months. Finally it begins to droop a little, appetite is not so good as usual, head a little pale, but it keeps up for a while, only to go at last the way so many little turkeys go. In a turkey of this age the disease may sometimes be checked by liberal feeding of chopped onions and cottage cheese, but cures are rare and medicine useless.

While certain articles of food, such as clabbered milk, cottage cheese and chopped greens seem to hinder the development of the blackhead germ, and others, like cracked corn and barley, encourage them, no certain rules for feeding can be given except this one, feed always less than the birds want. Rolled oats are particularly good for all ages of turkeys, and green feed should be a part of every meal. The one best feed seems to be sour milk or cottage cheese. Mr. Hadley of the Rhode Island station says in Bulletin No. 2, "Young poults can

probably be raised successfully on many different rations taken in addition to their normal insect diet. They may do well on corn meal alone; they may thrive on no other additional food than bread and milk until they are three to four months old. The main idea is to prevent overeating of whatever they do have."

But how to prevent overeating? How shall we draw the line between what poults need and what they want? How keep the edge of their hunger keen and yet provide adequate nourishment? This is where we all fall down. Mr. Hadley thinks time feeding is the solution, and during the period of greatest susceptibility to blackhead, that is from the second to the fifth month, he leaves the tray of feed before the poults only two or three minutes, never more. This seems little enough, but my experience is that it may be too much. Three minutes is a good while for poults to eat when they are eating, as they always do, as fast as they can. I used to feed out of my hand entirely, removing it while the poults were as eager as ever, and I am sure I never fed over two minutes. When I tried time feeding the time seemed longer than it had when I trusted to my own

## 2<sup>c</sup> Kodak Jr.

The pictures are of the pleasing panel shape, giving the high, narrow proportions that are so well suited to portraits—and when the camera is held horizontally, for landscapes and the like, it gives a long, narrow picture that is almost panoramic in effect.

And this long, narrow picture makes possible a thin, slim camera that fits the pocket—a detail that is often important, and always convenient.

The 2<sup>c</sup> Jr. loads for 10 exposures, is fully equipped for hand or tripod work. For snap-shots the shutter has speeds of 1-25, 1-50 and 1-100 of a second, and it has, of course, the usual "time exposure" releases. Well made and well finished in every detail—autographic, of course. All folding Kodaks now provide for autographically dating and titling each negative at the time of exposure.

The lenses are the best of their respective types, are adapted to this particular camera and each one is individually tested.

## "THE SERVICE FLAG"

I am the flag in the window,  
I am born of the Red, White and Blue,  
And the stars that you count on my bosom  
Are the sons I have taken from you.

I tell of a home that is saddened,  
I speak of a vacant chair—  
And a mother's heart that is longing  
For news of her boy "over there."  
I know when home ties are broken,  
And brave hearts over the sea,  
And I sigh for the lives that are given  
That the world may forever be free.

But I still have another message—  
Of lads who are loyal and true,  
Boys who are willing and eager  
To die for "Old Glory" and you.  
So pause in the day's busy hustle,  
Don't pass me with only a glance.  
Say a prayer for the boys in the home camps,  
And the ones who are Somewhere in France.  
—Camp Lewis "Over the Top."

## MOTHER'S LITTLE FLING

Continued from last week.

"In Manhattan, Kansas, I believe, watching the excitement of Camp Funston." Then at the expression on her brother's face, Mrs. Bennett suddenly sobered.

"There, there, Joshua, don't look so haggard. Mother wouldn't have worried you for the world but she thought you'd be safe at the mines for a month. I'll give you the history of Mother's wandering as far as I know it from her hurried letters. First of all, she stopped off to see Sary Ann Wilson's daughter on the other side of Kansas City.

"She was going on next to see her Cousin Abner's widow, but on the train she got acquainted with a young girl who was running away to meet her lover, 'a cowardly blatherskite of a married man,' she quoted again from the card in her hand, 'filled her head full of fool notions about being a free spirit and obeying her natural instinct. 'Natural instinct, your grandmother!' I told her. 'You turn right round and go home and mind your ma instead of those instincts that aren't natural to any nice girl.' We had to stay all night at the Junction. Lucky Joshua made me take all that money. But I took her right straight home and I guess her ma was glad enough to see her back safe, not to be hard on her. She was glad to get home too, poor child. The scoundrel!

"I stayed to the wedding; she'd had a tiff with a nice neighbor boy and gone off in a huff. It was a real nice wedding. I wore the new silk dress you gave me."

"Cousin Abner's widow's eldest son was about to have a barn raising when Mother arrived there and she turned right in and baked all the pies. She was afraid she'd got her hand out but her crust was just as flaky as when she took the blue ribbon at the county fair.

"Besides the frustrated elopement, the hastened wedding and the barn raising, she's been to a funeral—oh, no relative, just a lonely little woman on the train, who was taking her husband back to the old home for burial! She nursed a case of measles and she nearly adopted a pair of twins and at last she really headed for San Francisco, but her train was put on a siding next to a train load of troops; they were both delayed. They were all leaning out of their windows and Mother got acquainted with some of them.

"They were young things and they'd been in camp and it was hot. Some of them looked ill and all were homesick. Mother sewed buttons on for some of them. Just then sickness broke out in the camp and there weren't half enough nurses and no one to look after their mending so—Mother stayed."

"There's an express at two. I ought to have known better than to let Mother go off alone! I'll bring her straight home and you keep her here. Good-bye."

Eliza Bennett sank back on her pillows as Joshua rushed from the room.

"Joshua's a determined man but Mother set out to see Charlie and little Godfrey and I think she'll see them before she comes back."

In which surmise, Eliza Bennett proved her astuteness. Ten days later, Mrs. Bennett received a letter from her mother:

"Why in the world did you let Joshua start out on such a fool's chase? He broke his collar bone trying to ride a horse over the rough road to the post where I'm visiting now. This is no place for a man of Joshua's temperament and I'm sending him home with a trained nurse. I'm too busy to come with him. The excitement will soon be over and then I'll go on to California. Charlie and little Godfrey must be home by this time. Joshua had no business to go traipsing about the country that way. Do try to keep him at home."

Eliza Bennett lay back on her pillow and laughed the joyful laugh of an understanding daughter. — Eliza-beth Weir in *The Farmers Wife*.

## Oatmeal Pudding

One-fourth cup pinhead oatmeal or rolled oats, one cup boiling water, one and one-fourth cups hot milk, two tablespoons grated chocolate, five tablespoons corn syrup, one tablespoon butter, one teaspoon vanilla, salt.

Cook the oatmeal or the rolled oats in the water for 20 minutes. Add the remaining ingredients, and turn the mixture into a greased baking dish. Bake the pudding in a moderate oven for one hour. Serve it with or without cream.

## Rice Pudding

Three-fourths cup rice, one cup water, three cups hot milk, one-half teaspoon salt, five tablespoons maple syrup, one tablespoon butter, one-half teaspoon vanilla, one cup cold milk.

Soak the rice in the water for 20 minutes. Add the hot milk, and cook the rice for 15 minutes. Remove it from the heat and add the salt, the syrup, the butter and the vanilla. Turn the mixture into a greased baking dish, pour the cup of cold milk over the top, cover the dish and bake the pudding slowly for two hours. This pudding has an excellent flavor and a creamy consistency. It should be

served warm. It needs no sauce served with it.

## Molasses Cake

One-half cup fat, one and one-half cups molasses, one cup boiling water, one-fourth teaspoon salt, one teaspoon soda, one teaspoon ginger, one cup corn flour, one cup buckwheat flour, two eggs.

Cream the fat and add the molasses and the boiling water. Add the sifted dry ingredients to the first mixture. Add the eggs last. Bake the cake in a loaf or in a shallow pan in a moderate oven.

Apple Sauce Variation: To two cups of apple sauce, cooked until very thick, add one tablespoon butter, three tablespoons corn syrup and cinnamon as desired. Spread the apple sauce one-half inch thick over the bottom of the pan. Pour the molasses batter over the sauce, and bake it in a moderate oven. When the cake is done, turn it out of the pan so that the apple sauce is on top. Cut it in squares and serve it warm.

## HOME CANNED VEGETABLES

Even in enlightened California we sometimes hear of last year's home canned beans standing unused in their perfectly harmless glass con-

tainers because some one has caught the infection of hysteria disseminated by the "they say" nuisance. Here is a sensible editorial in "Successful Farming" which may be the means of reassuring those who need it — we hope but few.

"A very clever and cunning propaganda of fear has been spread throughout the country by the well wishers of Kaiser Wilhelm. Its purpose has been to not only discourage the women from putting up canned stuff, but to make the nation afraid to eat home canned goods that have been put up. First it was rumored that German spies had poisoned the rubber that the canning rings are made of. Then it was hinted that the canned goods this last season would give those who ate them a mysterious disease, which fear was increased because the supposed disease was discussed in a medical journal.

"Leave it to the German secret agents—they get in their work, even to getting reliable medical and other journals to print their scares! Then there was the widespread whisperings that the "cold pack" method was new, and that the stuff would not keep when canned by that process. It was also rumored that the government was going to tax or seize home canned goods.

"This propaganda was intended to keep the American housewives from saving food for home use, that other foods might be sent to the Allies. It was also intended to scare the people so what had been canned would not be eaten, for fear of poisoning or contracting some disease.

"If anybody wants to fall into the hands of the enemy before this country is subjected by conquest, then believe this nonsense about home canning. Let everybody else who is patriotic and courageous, determine to put in a bigger garden, and to can more stuff next season than ever before. Every pound of perishable food saved and eaten at home means that a pound of nonperishable food is made available for shipment to our boys in the trenches, and to our allies in great need of our food.

"If you will need more glass jars or tin cans for next season, get your supply as early as possible, for when canning season opens you may not be able to get any."

#### SWEET POTATO RECIPES

##### Mashed Sweet Potatoes

To two cups mashed sweet potatoes add three tablespoons butter, one-half teaspoon salt and hot milk to moisten. Beat until light and serve.

##### Glazed Sweet Potatoes

Four large sweet potatoes, one-fourth cup melted butter, one-half cup sugar, one-fourth cup hot water. Cook potatoes or use cold ones already boiled. Cut in half lengthwise and lay in baking pan. Add the hot water, sprinkle on the sugar and pour on the melted butter. Bake 20 minutes, basting frequently with the syrup in the pan. Serve hot.

##### Sweet Potato Pone

One quart raw sweet potato, grated; three pints milk, two eggs, one tablespoon nutmeg or allspice, one-half teaspoon salt, two and one-fourth cups sugar and one cup butter. Mix all the ingredients together and beat until smooth. Grease and flour a pan. Pour in the pone and bake one hour in a slow oven. Serve hot or cold with cream.

##### Sweet Potato Muffins

Mash very fine two cups of boiled sweet potatoes, add to it a large tablespoon butter and a little salt; whip well; now add one-half cup of milk and two well beaten eggs and flour enough to make a soft batter. Before adding the flour sift into it one teaspoon baking powder. Bake in muffin or gem pans.

##### Individual Sweet Potato Pies

Two cups sweet potato, one-half cup sugar, one and one-fourth teaspoons pans lined with crust and fill with salt, two eggs, two cups milk, one and one-fourth teaspoons nutmeg, one teaspoon cinnamon, juice and rind of one lemon. Mix ingredients well and beat until creamy and smooth. Cook until the mixture thickens. Use muffin mixture.

If you have a sweet-tooth, pull it.

#### WHEAT FLOUR SUBSTITUTES TO DATE

This is the list of wheat flour substitutes from which you may order. You will note that rye, milo and potatoes have been removed. These however may be purchased independently as desired.

Corn meal, corn flour, edible corn starch, hominy, corn grits, barley flour, potato flour, sweet potato flour, soya bean flour, feterita flour and meals, rice, rice flour, oat meal, rolled oats, buckwheat flour.

Exception—Whole wheat and Graham flour may be sold on the basis of five pounds of flour to three pounds of substitutes.

#### SUGAR TRIMMINGS

First cross off soda fountain and ice cream treats.

Reduce candy consumption to an after-dinner bonbon.

Omit icing from cakes and fancy breads.

Use fruit and nuts, candied honey or maple sugar for cake fillings.

Sweeten fruit drinks with honey or corn syrup.

Replace white sugar candies with syrup candies, or sweets made from figs, dates, and raisins combined with nuts.

I am convinced that nothing so makes for the comfort of a farm home as good lighting. During winter evenings the room may be warm and comfortable but, if poorly lighted, it can not be homelike nor comfortable.

To prevent boots from creaking and cracking rub the soles with linseed oil or place them in a plate full of oil. The treatment also makes them waterproof.

Do not cut the sewing machine belt when it becomes too loose. Instead put a few drops of castor oil on the band, run the machine a few minutes and the belt will be tightened.

Among the things that will soon be "made in Germany" will be Yankee trenches.

Corn and potatoes, America's two bumper crops for 1917, are eligible to the bill-of-fare three times a day seven days a week. Who will be the first American housewife to so ingeniously camouflage these products as to tempt the family appetite 21 times in succession.

Three carloads of apples provided by the International Apple Shippers' Association are on their way to England and France. The Red Cross will distribute some of the fruit to the wounded in hospitals and the Y. M. C. A. will take apples to the men in the trenches.

Children should have an abundance of pure cool drinking water. This is especially important in summer when they are perspiring freely. If there is any doubt about the purity of the water it should be filtered or boiled or both.

Equal parts of ammonia and turpentine will take paint out of clothing, no matter how hard or dry it may be. Saturate the spot two or three times, then wash out in soap suds.

Take a good fresh grip on things every morning. Make up your mind to let nothing spoil your day for you. Go about your work in that spirit, and you will be surprised to see how your difficulties will "vanish into thin air."

To take the brand out of flour sacks wet them and rub a thick coating of soap on, roll them tightly and let them stand for an hour or so before putting them in the water to wash them.

In the housekeeping battle do not forget to remember that, first of all you are a home-maker. It is a very sacred position to fill, and one not easily filled unless the heart is in the work.

Shortage of wheat in France is becoming more alarming each week. Pastry is now classed as a luxury and its manufacture or consumption is now suppressed except on Sundays and holidays.

Money saved works day and night for you. Buy war savings stamps!

#### Keep Cool Cook With Distillate Save Fuel

NO DANGER—NO WASTE—NO ODORS—NO WICKS—NO TROUBLE

Burns Distillate, Gasoline or Kerosene. ECONOMICAL—One gallon Distillate will burn for 18 consecutive hours, giving heat as great or greater than gas.

CONVENIENT—No connections to be made—can be placed in any convenient location. Special pamphlet with descriptions and prices of various sizes on application.

DON'T FORGET TO ASK, ALSO, FOR OUR NEW ILLUSTRATED CATALOGUE. It will prove of interest and value.

## RICE

By agreement between the growers and millers of rice and the food administration, prices for California rice have been fixed as follows: Paddy rice, \$4.10 per 100 pounds to the growers; cleaned rice, \$7.10 per 100 pounds from the mills to the trade, and \$8.00 per 100 from jobbers and wholesalers to the retailers.

## HAY

Under date of April 27, Scott, Magner & Miller says:

Receipts past week, 849 tons. Although we do not expect new crop on the market for some little time yet we note that the mowers have started in several sections on volunteer and alfalfa and if this dry weather continues no doubt they will be cutting in many other places shortly. This affects the buying public who have had to pay abnormal prices for some time past. On the other hand the dry weather the last week or two together with the hot north winds of a week ago are having their effect in the country districts, and prospects for a large crop are not nearly as good this week as they were two weeks ago. The natural result of this is that holders of hay in the country have not been as anxious the past week to sell as they were heretofore.

Alfalfa is in good supply and new crop can be expected ready for delivery within the next two weeks if the weather remains dry. This, naturally, will take the place of old hay as new crop is always given preference for feed over the old hay. Some sections complain that they will not have the necessary water for their later cuttings but taken as a whole it now looks as though the alfalfa crop would be large.

Fancy Wheat Hay	(light 5 wire bale) 27.00@28.00
No. 1 Wheat or Wheat and	Oat Hay 23.00@25.00
No. 2 Wheat or Wheat and	Oat Hay 20.00@22.00

## GRAIN

As to grain and feed prices see note under Los Angeles grain prices.

## RAISING TURKEYS

Continued from Page 575

judgment, but in both cases I lost poults with blackhead, and so I know I fed too much.

It seems to me the emphasis in Mr. Hadley's words, quoted above, should be on the phrase, "taken in addition to their normal insect diet." Turkeys rarely thrive when deprived of their normal insect diet, never unless that normal diet is closely approximated in some way. Cottage cheese or sour milk seems to be the nearest artificial approach to that normal diet, but it is a long way behind. Doubtless some time the young turkey will become accustomed, as the chick has, to a diet of artificial worms and bugs. When it does, blackhead will be a thing of the past. Until then, all we can do is to provide just as much of that normal diet of worms and bugs and seeds as we possibly can and add to it just as little of other things as will answer. Poults on good range need very little of feeding. The poorer the range, the more they must be fed. The mistake we make is not so much in our choice of the particular food which shall be used to supplement the natural range diet as in trying to supplement it beyond a certain point. Turkeys raised in close confinement are rarely profitable, and profit increases in direct proportion to the amount of range given.

The second rule for the care of poults is, keep them dry. This rule applies to all young birds, and no more to turkeys than to geese, only goslings more quickly outgrow their susceptibility to dampness than do turkeys. Running on the damp ground or on wet grass causes rheumatism, which is shown by twisted feet, bent toes and lameness. After the poults are a week old they may be given their liberty but should not leave the coop till the grass is dry, and should return to it before night. If the weather is rainy or threatening they should be kept in. Their coop should be rain tight on three sides but open on the fourth and should have a board floor. The first two weeks, at least, it should stand in a sunny yard, with some windbreak. The east side of a building is an excellent place for poults. After the second week the coop may be placed in an open field, wherever it is most desirable to keep them. If they are a good way from the house, so much the better. They will not get the habit of hanging round the chicken yards when they should be ranging.

The third rule for raising turkeys is, keep them clean. My own poults, when they died, have died of blackhead. I never saw one that I thought was lousy. But then I always dusted the hen and often dusted the poults, too. There is absolutely no excuse for lice on turkeys, for dusting both hen and poults once a week will keep them away forever. No one who is unwilling to do this much for turkeys should have the care of them. Lice will kill a turkey much more certainly than they will a chick, but no turkey needs to have lice. Blackhead we have not learned to prevent; lice are completely in our power.

# "Water Boy" Automatic Poultry Fountain

The "Water Boy" is a perfect sanitary fountain for use in poultry houses and poultry yards. It is absolutely automatic and can be attached to any pipe the same as a faucet. An attachment on the float permits you to adjust the water to any level desired. You are assured of having pure, clean water in your yards and houses at all times, without waste or a sloppy, muddy condition around troughs and crocks. Don't waste your valuable time carrying water—install a few Water Boys and they'll more than pay for themselves in a short time in saving of labor.

Water Boys, with metal floats, \$1.00 each. Half dozen lots 5c reduction on each. Dozen lots, 10c reduction on each. Metal Floats 20c each. Old "Water Boys" made as good as new for 25c.

## A Pennsylvania Farmer Says Concerning Electric Motors on His Farm

"A one-horse power motor is located in the spring house for separating milk, churning butter, turning a grinding stone, etc.

"In the house, my wife has a 1/2-horse power motor for running a washing machine. This motor can be attached to any lamp socket.

"In the barn a 15-horse power motor mounted on a little truck may be moved to any part of the barn or barnyard for grinding feed, baling hay and threshing grain. By extending the cable we have used this motor 400 feet from the barn."

This letter suggests equally profitable installations around your house and barns. The General Electric Company manufactures all sizes of electric motors for farm use. Information will be gladly furnished by your lighting company or our nearest motor agency.

"Yes Sir!  
**Extra Tested**  
Means Extra Miles to Me"

And so it will to you, once you make the lasting friendship of Racine Country Road and Multi-Mile Cord tires. For these proved quality tires are Extra Tested, step by step in Racine Rubber Company factories.

## RACINE Country Road and Multi-Mile Cord TIRES

Each Extra Test is vital. Each shows its value in long time use. For instance: the Extra Test for Accurate Compound requires the weighing to ounce fractions of all substances used. This does away with all possibility of inaccuracy in compounding. It means a better tire.

Racine Country Road Tires—5000 mile guarantee—are proved mileage leaders over country roads.

Racine Multi-Mile Cord Tires—unmatched quality—Extra Tested, superior cord value in every respect.

Also red and gray inner tubes—Extra Tested.

It will pay you to know the dealer who sells them.

For Your Own Protection Be Certain Every Racine Tire You Buy, Bears The Name

RACINE RUBBER CO.  
Racine, Wis.

## Canada made me Prosperous

—that's what thousands of farmers say, who have gone from the U. S. to settle on homesteads or buy land in Western Canada. Canada's invitation to every industrious worker to settle in Manitoba, Saskatchewan or Alberta is especially attractive. She wants farmers to make money and happy, prosperous homes for themselves by helping her raise immense wheat crops to feed the world.

### You Can Get a Homestead of 160 Acres FREE

or other lands at very low prices. Where you can buy good farm land at \$15. to \$30. per acre that will raise 20 to 46 bushels of \$2. wheat to the acre—it's easy to become prosperous. Canadian farmers also grow wonderful crops of Oats, Barley and Flax. Mixed Farming is fully as profitable an industry as grain raising. The excellent grasses, full of nutrition, are the only food required either for beef or dairy purposes. Good schools and churches, markets convenient, climate excellent. Write for literature and particulars as to reduced railway rates to Supt. Immigration, Ottawa, Can., or to

## A Field of Rice in Yolo County

Five Years Ago California Produced \$75,000 Worth of Rice; in 1917, \$12,000,000 Worth. More Than 90 Per Cent Produced in Sacramento Valley. Butte, Glenn and Yolo Counties Are Adding Thousands of Acres to Last Year's Plantings.

## Ajax Shoulders of Strength

### More Rubber Where It Should Be

These bracing Shoulders of Strength—found only on Ajax tires—give to Ajax tires a greater resistance to wear. Because of these reinforcing shoulders, built in on both sides of the tread, Ajax tires have more rubber where it should be—more tread on the road.

With Ajax Shoulders of Strength, Ajax tires—guaranteed in writing, 5000 miles—roll up mileage records far beyond the guaranteed distance.

#### 97% Owners' Choice

Ajax tires are 97% Owners' Choice. This huge percentage is chosen by individual owners to replace other tires that come on their cars. In 1917, Ajax tires won the title, "Dirt Track Champions of America." They swept the field in 237 dirt track races, at state fairs all over the nation.

Here's proof! They win on roads you drive on.

Investigate Ajax tires and inner tubes. Write for free books, "Ajax Shoulders of Strength" and "Ajax Wins Dirt Track Championships."

QUICK AND ECONOMICAL TRANSPORTATION

## Nash Trucks Save Your Time

Moving loads about the farm, or between farm and town, in the busy fruit season, Nash trucks save your time.

Equipped with M & S automatic locking differentials and internal gear drive rear axles, they also have many other mechanical features which enable them to speed up your hauling and reduce its costs.

Because of the automatic locking differential, the Nash truck's driving wheels cannot spin. This saves fuel, saves tires and allows the Nash truck to get through where other trucks without this important feature cannot go.

The unusually strong internal gear drive axle is not only much lighter and simpler than others but delivers more power to the wheels, especially at low engine speeds.

Our transportation expert will be glad to tell you which Nash truck will best serve your purpose.

## Counties Cooperate in Food Production

Lake County Furnishes the Water; Yolo County Furnishes the Land, the Tractors, the Labor; and 10,000 Additional Acres of Rice Production is Made Possible

**Y**OLO County is shouting for Old Glory and talking patriotism, and, better still, she is acting. Last year in answer to the appeal for more food she increased her production to the limit. At last, so it seemed. This year she de-

agreed to pay \$4.00 additional cost per acre, and it is thought that this acreage will be increased to at least 10,000.

This war measure will lower the waters in Clear Lake several feet, but Lake County people will trust to another season's rainfall to restore it to its old level. Another patriotic step

Interior of Rice Mill at Woodland

pany; Charles E. Virden, president Sacramento County chamber of commerce and manager Pacific Rice Growers; W. G. Mixon, editor of the Woodland Mail, and to every booster in these two counties credit is due.

Especially is credit due to Lake County people because of their hearty response to the suggestion which means for a time at least the taking away of their wealth giving water to another county.

Threshing Rice in Yolo County

Yolo County is adding more than 10,000 acres to its last year's production.

etermined to do even better and accomplish the impossible.

There is to an extent a shortage of water which made rice culture impossible. However, Lake County has supply which can be used on lands in Yolo County, and Lake County, equally as patriotic, agrees to deliver water to Yolo, hence Yolo County rice growers meet and talk rice and plant rice. It has taken no little time and planning on the part of the United States food commission, the Yolo Water and Power Company, Yolo rice growers, supervisors of the two counties and others to bring about this patriotic move. The Yolo County democrat reports that farmers representing a total acreage of 5993 have

as a result of this disposal of the waters by Lake County will be the use of the funds derived from their sale in the construction of good roads.

This combination which will result in the addition of hundreds of thousands of dollars to the wealth of the two counties is the result of hard work on the part of such boosters as Fred Shaffer, secretary of the Yolo County board of trade; Ralph P. Merritt, state food administrator; Frank Adams, professor of irrigation, University of California; Dr. Fred Burroughs, secretary Yolo County Rice Growers' Association; John L. Stevens; J. L. Harlan; A. C. Huston, president Yolo Water and Power Com-

Hauling Rice for the Boys "Over There"

Sacramento Valley's production of rice has been a material factor in feeding the world.

## Fire Fighting in Napa County

**W**E MUST produce more" is repeated until to those of us who are so busy producing it becomes tiresome. But we must continue to hear it, for

there are some slow of perception who require the line upon line, precept upon precept type of education, and we will continue to talk more of producing more. But there is the other question equally as important, and that is conservation. The housewife has heard this until she too is becoming tired. But there is another form of conservation which calls for the checkmating of intentional acts of disloyalty and those other acts almost as disloyal, which come from carelessness in the causing and permitting of fires which sweep our fields and sometimes even destroy our buildings. Last season we called attention to the Solano County plan which resulted in the formation of volunteer companies in all parts of the county with fire fighting apparatus located on main highways and telephone system perfected that the first notice of

field or other fires brought together efficient organized forces ready for action. This resulted in the saving of thousands of dollars and the more valuable feeds and foods so greatly needed.

### Baade Gets Busy

This year Farm Adviser Baade of Napa County has taken early action and brought the people of his county together at Napa and perfected a fire fighting force which will cost the county but little in dollars and save much. There was a great meeting. Twenty-two volunteer fire fighting companies answered "present." The assembly hall overflowed. California's Governor Stephens was there.

### He Said:—

"I have come a considerable distance at a time when many official duties are pressing, to express appreciation of what you have done in Napa County and to endeavor to stimulate similar activities in all the counties of the state. We are just beginning to face the real problems

of the war. The nation has just commenced to sense the gravity of the situation. It is now buckling down to the stupendous task before it.

"It is essential that we develop production to a maximum. It is equally essential that we protect our growing crops and the harvested product. Our cattle ranges and property of every kind must be safeguarded. Food for our soldiers, for our Allies, and for our own people is the important consideration, and we must plan energetically to prevent its loss by fire.

"I am greatly interested in this movement to establish organized fire protection bodies throughout our state. I hope grain farmers everywhere will keep their plows in good condition, chains and stretchers ready, and horses or tractors quickly available to plow lanes around an incipient fire. Where feasible and practicable we want fire apparatus provided such as proved so successful in Solano County last summer. I hope the people can be interested in all the counties just as has been done in Napa to

exert a greater vigilance against fires and to be prepared for prompt and organized effort to put them out.

"The sweep of a blaze across one grain field can easily nullify the efforts of a thousand patriotic families in food conservation. The Germans would gladly expend a thousand shells to effect as much damage. If submarines dealt as great a loss, Berlin might exultantly chronicle the fact.

"Such thorough fire protection as you loyal citizens of Napa have planned is getting down to real business in war work. It has enlisted my enthusiasm more than anything else that has been done in a long time. I am going to talk fire protection as much as I can to the people of our state, and I shall point to Napa County as an example of how best to provide it. Guarding of our warehouses and industrial plants from fire is one of our difficult problems. We would require a force that would be a great army in itself. An alert citizenry with measures taken for a quick detection of fire and for prevention and with preparation

# WEST COAST GAS ENGINE

MADE IN CALIFORNIA

The Essential Features are:

**Simplicity      Durability**  
**Dependability**  
**Smooth Operation**  
**Low Fuel Consumption**  
**Guaranteed**

The West Coast Distillate Engine is the culmination of 16 years of progress in the manufacture of internal combustion engines by this company. Each of the 16 consecutive years has shown its own advance in design and manufacture until WEST COAST GAS ENGINES today have their own unapproached standard of quality.

## PUMPS

Let Us Tell You All About

### KIMBALL'S Direct Flow Turbine

Save Digging Pits and Large Wells

The Kimball Direct Flow Turbine is a moderate speed rotative pump employing an improved design of Impeller and Rectifier not embodied in any other pump. This, coupled with low velocity, reduces the friction to a minimum thus saving horsepower and reducing wear. All bearings are lubricated through a hollow shafting by a positive lubricating system. These bearings are protected by automatic water tight packing glands to prevent sand entering.

**Look at This!**

A Kimball Direct Flow Turbine will pump:  
 40 miners inches out of a 7 inch well.  
 115 miners inches out of a 10 inch well.  
 200 miners inches out of a 12 inch well.

Write us your irrigation requirements. NO CHARGE FOR ESTIMATES. Our many years of experience in irrigating systems places us in a position to help you save money if you will give us an opportunity.

for ready assemblage of men on the sounding of an alarm will mean much to relieve the anxiety we have all felt over the exposure, particularly of our grain warehouses in the country sections, to the careless spark or skulking I. W. W. After all, the government must rely on the individual citizen. A free people does not want swarms of gendarmes or policemen. In proportion as it does not need them is free government successful. With freedom comes responsibility and every citizen must realize this in his heart in these times of stress and peril. I congratulate you people of Napa on meeting this responsibility as you have."

#### The Plan

The plan of organization followed in Napa County is to divide the county into 22 districts, each headed by a chief designated a fire warden by the state forester, and a deputy sheriff by the sheriff. His duties are to ask 11 neighbors to join his company, to equip the company with a light truck, which will carry barrels, buckets, tools, fire extinguishers and other paraphernalia for extinguishing fire. The company is drilled in fire fighting. It takes charge of such fires as arise, investigates their cause, inspects all property in its district with reference to fire risk, attends to necessary plowing around grain stacks and backs the prosecution of those responsible for fires. The organization in Napa County has been under the direction of the county farm adviser,

he in turn acting with the cooperation and direction of G. M. Homans, state forester.

In the Napa Journal's report of the meeting we note:

Prof. H. J. Baade called the roll of the fire companies and their chiefs and assistant chiefs, and those responding were then sworn in as deputy sheriffs by Sheriff E. A. Kelton, and as deputy fire wardens by State Forester Homans.

Fire Chief C. F. Otterson was then chosen as county fire marshal. The chiefs of the 22 rural companies will be responsible to and report to him in all cases of fire in their districts.

This organization has been formed under the supervision of County Farm Adviser H. J. Baade, he acting in cooperation with State Forester Homans. It was a three months job.

At the close of the meeting the rural firemen, cheering and proudly displaying their banners, assembled on the steps of the court house and were photographed. After that they made a procession in their autos around the principal streets of the city.

Mr. Baade, the members of the companies themselves, and the general public, are to be congratulated on having such an efficient aggregation to call upon in case of grain or forest fires. If such a system had been available heretofore, many of the destructive fires which have caused such devastation in the past in this county might have been easily checked and much damage avoided.

## Protecting Citrus Fruits Against Rots in Transit

Successful Method Used in Porto Rico

**S**OUTH of Porto Rico little interest is taken in the shipping of oranges and grapefruit, save for unimportant and unorganized inter-island trade, says a writer in the Agricultural News of Barbados. The only citrus fruit industry of importance is the green lime trade with New York. In this case, when the fruit is well selected and packed according to approved methods, the losses from storage rots are not, so far as the writer is aware, of serious consequence. The complaints which have been made would seem to have reference to poor quality and careless packing in the shipments made by speculators during periods of heavy demand.

In Porto Rico and the Isle of Pines there is a developing trade in grapefruit, and considerable attention has to be given to prevention of losses in transit. A recent paper by J. M. Rodgers and F. S. Earle (Phytopathology, VII, 361), who are working at San Pedro, Isle of Pines, records the discovery of a simple and effective method of protecting citrus fruits against stem-end rot. It may find an application in the British West Indies in the occasional shipments made to England, and may even come to have an interest for the green lime trade when the growing competition leads to more discrimination as to quality.

Most growers are by now acquainted, at least in theory, with the dictum that fruits for shipment should be handled as delicately as if they were eggs, but it was found at San Pedro that even this did not suffice. Fruit picked under direct supervision of careful foremen, by laborers wearing cotton gloves, placed in standard field crates, and hauled to the packing house on wagons with bolster springs, graded by experts, and every doubtful fruit rejected—conditions which would suggest the millennium to any planter of the writer's acquaintance—still showed a large amount of decay in transit.

A large proportion of the loss was found to be due to Diplodia rot starting from the stem end of fruit, with no apparent injury. A Diplodia species, it may be remarked, appears to be common on ripe limes throughout these islands. It was noted that fruit which had been clipped, retaining the calyx, showed much more susceptibility than fruit which had been pulled, owing to prevention in the former case of quick drying-out of the stem cavity.

The first attempt at protecting the fruit was made with paraffin wax. The

coating of the rind with this substance did not materially alter the amount of loss from rot, but it prevented the fruit from shriveling, and made it possible to keep thin-skinned lemons in excellent condition for two or three months. The application of paraffin to the stem ends gave promising results as a measure against stem-end rot, but was not altogether satisfactory because the material did not stick well.

The next method tried was so successful that there was no necessity to seek further. It consisted in the application, to the stem end of pulled fruits, of shellac diluted to a thin consistency with alcohol. It is easily and quickly applied, sticks well, and seals the cavity perfectly. With clipped fruits the results are much less satisfactory.

The difference between pulled and clipped fruit was consistently high all through the experiments, and is in itself at least as significant as the differences obtained by coating the stem end. Incidentally it was found that washing, in running water or in a tank, so increased the amount of decay that, in the author's words, "the use of a soaking tank is the greatest possible folly."

The conclusions reached may be thus set out:

- (1) That citrus fruit should be pulled, not clipped;
- (2) That coating the stem cavity with shellac largely prevents stem-end rot;
- (3) That coating the rind with paraffin keeps the fruit in good condition for an additional month or six weeks;
- (4) That washing the fruit induces heavy losses.

#### PROPOSED INTERSTATE CONFERENCE

Unless something unforeseen happens a conference new in the annals of horticultural procedure in California will be held at some point during the coming autumn. The date has not yet been definitely fixed but the fruit growers' and farmers' convention to be held at Riverside in November will probably be selected as it possesses many advantages.

The conference in question proposes to bring together representatives from Arizona, Nevada, Utah, Colorado, Idaho, Oregon, Montana, Washington, California, the federal horticultural board, Canada and the Mexican state of Lower California for the purpose of bringing about a better understanding

**PROFIT** comes from fruit, not foliage. On citrus fruits use immediately available

of existing horticultural laws and ordinances and effecting greater co-operation in this phase of horticultural activity. In its broader aspect the conference aims to reduce to a minimum restrictions in the interstate movement of agricultural produce by the adoption of standardized statutes and regulations, to prevent the dissemination of and to aid in the suppression of plant pests and diseases throughout the Pacific coast and adjacent territory.

Commenting upon the proposed conference Mr. Hecke states that there have been a number of instances when it has been felt that if representatives of adjacent states could personally discuss matters demanding special attention much more satisfactory settlements could be made. There are also a number of dangerous insect pests existing in the eastern part of the United States which have not yet made their appearance in the West. These, if allowed to become introduced, are certain to cause widespread destruction. Among these may be mentioned the white pine blister rust and the pine shoot moth, both of which will cause great havoc among our sugar pines; the notorious gypsy and brown tail moths, which feed upon almost any class of vegetation; the leopard moth, which will attack both our fruit and shade trees and is almost impossible of control; the European mole cricket; the newly introduced corn moth; and a host of others of which a volume could be written; to say nothing of the boll weevil and the pink boll worm of cotton, and citrus canker, which are of interest mainly to the states of California and Arizona.

It is of great importance that more and better cooperation exist between the states in preventing the dissemination of and in the suppression of these common enemies.

Mr. Hecke reports that as a result of informal correspondence with the officials directly concerned with the horticultural laws of the various states all who have been approached have expressed a desire to attend and are unanimous in the opinion that such a conference is fraught with great possibilities for permanent good.

### DRASTIC BUT EFFECTIVE

The state horticultural commissioner is sending out the following statement regarding one horticultural event in Florida. We give it because it is sometimes claimed California is over drastic, this especially by Florida nurserymen who have wished to enter this state's business. The statement issued by California's commission:

"A recent communication received at the office of the horticultural commission from the state plant inspector of Florida calls attention to the fact that a certain nurseryman in California shipped into the state of Florida citrus material under a deciduous stock permit. Inspection of the material in question revealed also that the number of plants in the shipment was in excess of the number mentioned in the certificate, there being also certain other irregularities of marking.

"The action of the Florida authorities was quick and drastic. The shipment was destroyed and the permit of the offending nurseryman to ship plant material into Florida was promptly cancelled and a request presented for the return of all shipping tags. While it is admitted by the Florida authorities that there may be extenuating circumstances it will be noticed that her inspectors propose to take no chances of similar shipments arriving during the interim of a possible investigation. They have, therefore, stopped the shipments and are investigating at their leisure. Florida's action in this connection is an example of the interest that state is taking in protecting her horticultural industries and also of the rigid compliance with regulations which she proposes to exact from all persons who wish to do business in the above connection within her boundaries."

The United States department of agriculture, through Division of Publications, Washington, D. C., will mail free upon request Bulletin 933, "Spraying for the Control of Mites Attacking Citrus Trees in Florida." The bulletin is fully illustrated, showing white fly and many other Florida pests.

## TEAGUE QUALITY CITRUS TREES

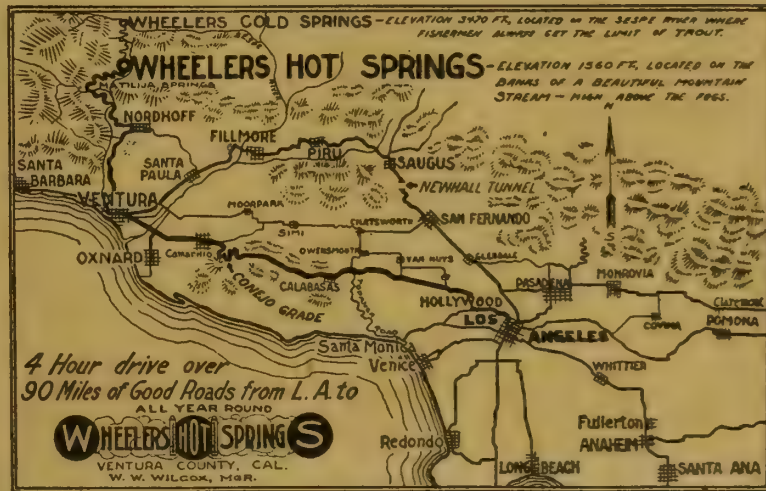

AWARDED THE GOLD MEDAL AT FOUR INTERNATIONAL EXPOSITIONS.

For Productive values, fine quality of fruit and vigorous growth Teague's bud-selected, (pedigreed) properly trained and carefully handled orange and lemon, pomelo and lime trees are the trees to plant. An experience covering a third of a century warrants the assertion that Teague Quality Citrus Trees possess these qualifications in a superlative degree. All the standard commercial sorts, and garden and ornamental varieties; the largest assortment of citrus trees in America. We invite correspondence from intending planters. Consultations on citrus planting by appointment. 1918 Price list just out; send for a copy.

DAVENPORT CO., MFGS., 110-112 NORTH LOS ANGELES STREET, LOS ANGELES.**

## Additional Crop Reports

**GOOD** crop, rather above average, is a fair summarizing of the individual reports which have come from various parts of the state. Fair prices assured. The fruit grower is not worrying—save when he thinks of the hired man.

**Geo. Marchbank, Horticultural Commissioner, Madera County**

Apricots 55 per cent, peaches 75, almonds 70, plums, 65, prunes 85.

**C. G. Marchus, San Pasqual, San Diego County**

From present outlook I will have about one-third crop of apricots. I had extra heavy crop last year, 15 tons dried on eight acres, beside 1200 lug boxes green so I did not look for heavy crop this year.

**California Prune and Apricot Growers, H. C. Dunlap**

Apricots will be a better crop than last year in the Santa Clara Valley and surrounding districts. South Coast districts, Ventura, Orange, etc., not as heavy as last year. Crops compare favorably, even better, than last year in the Southern San Joaquin; also Yolo and Solano County sections. There will possibly be a total tonnage of green cots this year to materially exceed that of 1917 crop. We hardly anticipate a very heavy crop of prunes after last year's bumper crop. The present outlook appears to be a duplication of last season in the districts north of the Bay, Sonoma, Napa and Sacramento Valley. South San Joaquin district probably will not exceed two-thirds of last season's crop. Santa Clara is setting very backward and cannot be definitely computed at present. If the result here compares with that in other districts, we can look forward to 180,000,000 pounds or more.

Almonds appear to be for the most part an excellent crop. Have no personal knowledge of cherries but I believe reports are good. Peaches possibly not as heavy as last year. This could hardly be expected. Good crop in sight, however.

**J. E. Hassler, Horticultural Commissioner, Eldorado County**

I have waited with my report till now as fruit trees up here are very late in blooming this spring, in fact during my residence here of 45 years they have never bloomed this late in the season.

As for the outlook of deciduous shipping fruits such as we grow here the promise now is a 100 per cent crop in all lines with the exception of apples, bloom of which is rather light.

**Winters Dried Fruit Company, Yolo County**

Our season is now far enough advanced to make report of estimate as shown below without reasonably expecting to make further reductions. The rainfall to date is far below our normal, being 10.25 inches, against 20 inches normal. The previous season only totaled 12.22 inches. Comment is unnecessary upon this shortage of moisture, suffice it to say it is noticeable in all fruits. The weakened buds were irregular in blooming, some trees failing entirely to bloom out. At this writing, due to an unusually good growing spring, fruit is making a fair showing, but it is questionable as to maturing to normal size unless irrigated, which is now going on in probably 50 per cent of the orchards from ditch or pumping.

Early in April heavy frost damaged almonds and apricots in some sections.

Season about 15 days late, or about same as last season. Estimates given below in per cent, basing normal at 100 per cent.

Apricots. About 50 per cent, or 4000 tons green. Some shothole fungus which no doubt will increase the tonnage of dried considerably over that of last season.

Peaches. Muirs and Elbertas about 85 per cent, Lovells about 50 per cent; shipping peaches 35 per cent to 40 per cent.

Prunes about 75 per cent. Plums. Average all varieties, 50 per cent.

Pears, 100 per cent.

Almonds. Hatch varieties 60 per cent, Drakes 75 per cent, Peerless 60 per cent, Texas Pro. 35 per cent.

Figs. First crop looking well.

Grapes. Indications favorable for good crop.

## Effect of the War on the California Fruit Industry

By George Robertson, Statistician State Board of Agriculture

**THE** figures regarding the imports and exports of fruits during the last four years show some remarkable results. Bananas and pineapples, not being raised in California, are only included so as to show the total value of fruits imported. Dates are now being produced to limited extent but the prospects of the industry are encouraging. The importation of currants, which in 1894 amounted to upwards of 52,000,000 pounds, and in 1913 to 47,000,000 pounds, were only

32,000,000 pounds in 1914, and fell to 793,000 pounds in 1917, which had the effect of greatly increasing the demand for California seedless raisins. Figs have fallen off from 20,000,000 pounds in 1914, to 3,000,000 pounds in 1917; in the previous year there was a temporary increase owing to the importation of an unusually large shipment of 8,000,000 pounds in December of that year, mostly from Portugal, but of an inferior grade, which were used mostly for confectionery purposes. The imports of Almeria

\*Dried  
\*\*Ripe  
\*\*\*Dried, Ripe or Green

grapes has also decreased materially, or from 1,330,000 cubic feet, (100 cubic feet being equal to one ton) in 1914 to 576,000 cubic feet in 1917. The value of lemons has decreased from \$5,227,000 in 1914, to \$1,877,000 in 1917, but the value of oranges shows an increase of from \$52,000 to \$141,000. Olives have not fluctuated in quantity or price so much as other fruits, 5,743,000 gallons being imported in 1914 and 4,367,000 in 1917. Importations of raisins have been steadily falling off for the last ten years; in 1914 3,873,000 pounds were imported but only 989,000 pounds in 1917, by far the lowest quantity ever recorded. It will be observed that the total value of imported fruits is still very high, and these figures go to prove that there is ample room for a much larger development of the fruit industry in California. The following summary is instructive:

Foreign Trade in Fruits

Year	Imports Value	Exports Value
1914	\$32,235,011	\$28,868,839
1915	23,046,778	36,926,567
1916	25,533,582	35,999,814
1917	23,172,272	33,615,891

Exports of Domestic Fruits

In exports, apples and oranges are the leading fresh fruits, prunes and raisins in dried fruits, while canned fruits are also an important item. The quantity of dried apples exported in 1914 amounted to 31,027,000 pounds, but in 1917 the quantity fell to 7,852,000 pounds. Of green or ripe apples 1,541,000 barrels were exported in 1914, and 958,000 barrels in 1917. Dried apricots also declined from 16,541,000 pounds in 1914 to 6,728,000 pounds in 1917. Figs are not yet being exported in any quantity, but the industry is growing rapidly, and a large acreage has been planted during the last year or two, especially in Fresno County. In citrus fruits the exports are remarkably steady and their value forms an important item.

In 1914, 94,300 boxes of lemons were exported, compared with 154,300 boxes in 1917, while oranges amounted to 1,839,000 boxes in 1914 and 1,860,000 boxes in 1917. Dried peaches, one of our most important crops, shows a considerable falling off in exports since 1915, when it amounted to 18,660,000 pounds. The quantity in 1914 was 7,387,000 pounds, but in 1917 only 6,523,000 pounds were exported. The exports of green or ripe pears is comparatively small, but during the last two years has increased. Prunes have always been one of our largest exports in dried fruits, the quantity in 1914 being 35,228,000 pounds and 48,097,000 pounds in 1917, but in some years have considerably exceeded those figures. The export of raisins has rapidly increased in recent years, and in 1917 equaled that of prunes. The exports in 1914 were 21,688,000 pounds, and in 1917, 46,746,000 pounds, and in 1915 amounted to 58,585,000 pounds.

The only other fruit product that calls for special notice is canned fruits, the value of which in 1914 was \$5,553,000, compared with \$6,103,000 in 1917.

SPRAYING CONTROLS APPLE POWDERY MILDEW IN NORTHWEST

Powdery mildew, the most serious fungous disease occurring on apples in the irrigated orchards of the Northwest, and sometimes causing considerable damage in semiarid regions farther east and south, can be controlled by thorough spraying. Lime-sulphur diluted one to 50 is the spray to use. This is the recommendation of D. F. Fisher, a specialist in the office of fruit disease investigations, United States department of agriculture, after a three-year field investigation of this disease, especially in the Wenatchee Valley. A serious attack of this mildew often results in a crop reduction the following year of more than 50 per cent, and it also causes a dwarfing and a russetting of the fruit which greatly reduces its market value.

Serve and save. Buy war savings stamps! Spend, but spend wisely! Save, and save earnestly! Buy war savings stamps!

Our engineers on the western front are as busy as a bull pup with a carpet slipper.

ROSE LEAF-HOPPER

The Oregon agricultural college at Corvallis, through the Hood River branch of its experiment station, has issued Bulletin 148, "The Life-History and Control of the Rose Leaf-Hopper." Unfortunately the rose is not the only host of this pest, for the apple is seriously injured, as are cherries, plums, grapes, and other economic plants. This bulletin of 32 pages makes a complete study of it. The summary as to the treatment is as follows:

The use of lime-sulphur in the ten-day and 30-day scab sprays has been found effective in controlling the first generation in apple orchards. The spray has to be applied while the insects are in the first and third nymphal stages in order to be effective. After this period, Black-leaf 40, 1-1200 plus five pounds of soap to 100 gallons of water, has been found satisfactory in destroying the hoppers.

On roses, Black-leaf 40, 1-2000 plus five pounds of soap to 100 gallons of water, is effective when applied to insects in the first and third stages of

their growth. For insects in the last two stages of their development increase the Black-leaf to 1-1200. All sprays should be directed upward in order to strike the insects, which are all located on the under surfaces of the leaves.

GROWING PEACHES

Farmers' Bulletin 917, "Growing Peaches," is issued by the United States department of agriculture, and may be had by writing Division of Publications, Washington, D. C. It is a 48 page bulletin giving distribution and statistics of peach growing, discussion of site, location, planting, culture, and pest and disease control.

EVAPORATION OF PRUNES

The Oregon agricultural experiment station has gathered together in Bulletin 145 a fund of valuable information on fruit evaporation, and especially on the evaporation of prunes. The report is made by Profs. C. I. Lewis, F. R. Brown, and A. F. Barss. Diagrams and plans of

funnel and stack types of evaporators are given, and many other illustrations showing methods of handling in the moist climate of the North. The bulletin is for free distribution to residents of Oregon, and we presume California prune growers who send postage may secure it.

DRIED FRUIT SALES

Dealers and packers of licensed dried fruits, which include prunes, raisins, peaches and apples, will not be permitted to make sales prior to June 1, it was announced by the United States food administration recently in a telegram to Ralph P. Merritt, federal food commissioner for the state.

This decision amends a previous ruling of the food administration which would have permitted dealers and packers to make sales on and after May 1. Fruit growers will not be materially affected by the ruling as there is no restriction on buying for future deliveries, it was announced.

PAIGE  
The Most Beautiful Car in America

The Modern Farmer and His Car

Once upon a time, agriculture was a mere gamble with Fate. Ground was broken—seed planted—and the farmer spent the rest of his time hoping that the elements would take him into partnership.

All of that has changed now. The modern farmer has become a business man.

He employs the scientific information which is supplied him by our Government. He makes a study of his own local problems and plans his crops accordingly. He thinks in terms of markets as well as products, and, above all, he uses thoroughly efficient mechanical equipment.

He buys a motor car because sound analysis has convinced him that he can't afford to get along without one. Furthermore, he buys a good car—a quality car—because experience has demonstrated that inferior equipment is never economical.

Here, in a nutshell, you will find the reason why more than 70% of Paige production is sold in farming communities. It's a matter of cold blooded business judgment—the deliberate preference of intelligent men for a car that measures up to their requirements.

And here, incidentally, is the most convincing reason why your next car should be a Paige.

**OUR ADVERTISERS RELIABLE**

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscribers must have mentioned the Cultivator when writing the advertiser.

**THIS WEEK'S COVER**

California has surprised itself, and all the rest of the country in fact, by the immense production of food in its rice fields. The industry began in the northern end of the Sacramento Valley and has worked its way southward until Imperial, down next to the Mexican line, is making commercial plantings. The cover illustration shows one of Yolo County's fields, and other Yolo County scenes appear on third page of this issue. Photographs from which these were made were furnished to us by the Yolo County chamber of commerce.

**EDWARD H. SHEPARD**

Edward H. Shepard, founder, editor and publisher of "Better Fruit," one of the best papers devoted to fruit marketing on the Pacific Coast, died at his home in Portland, Monday, April 29. Mr. Shepard is personally known to many California fruit growers, for he has attended and made addresses at state fruit growers' conventions in this state. All who have known him will hear with profound regret of his sudden passing.

**MARKET INFORMATION**

While it is impossible for the government to make prices or to give assurance of stable prices to fruit and vegetable producers, the bureau of markets of the department of agriculture is aiding in every way possible in stabilizing the market. The bureau of markets, now recognizing the needs of the Pacific Coast, has established at the centers of Los Angeles, San Francisco, Portland and Seattle, branches of the bureau which will issue daily reports showing carlot shipments at all important fruit markets. These will be in the form of separ-

ates, that is, each day in season such perishable food commodities as apples, cantaloupes, grapes, onions, peaches, potatoes, tomatoes, watermelons, celery, etc. will be reported on as to shipments and market, cold storage, etc.

The western branches will be under direction of O. W. Schleussner whose office is in the Union Terminal Building, Los Angeles. H. H. Warner is in charge of the Los Angeles branch.

**TO WIN THE WAR**

The third liberty loan campaign was a success. The government asked for three billions; the people responded with pledges to take four. Almost every state exceeded its quota. California did herself proud by exceeding her total quota, and every county and nearly every city and hamlet likewise went over the top. The entire Pacific Coast district, which reported through the San Francisco federal reserve bank, showed 102 per cent subscriptions, which carries us

through properly authorized committees, and through contributions and voluntary service, should for the harvest years of 1919 and 1920 raise food products on its public state lands and on the national lands within its boundaries, said food products to be known as the "Liberty Crop," to be delivered to the warehouses designated and to be tendered by the states, free of charge as a free-will offering to the United States government and to the Allies, the United States government to apportion this "Liberty Crop" between itself and its Allies.

**CASH AND CARRY**

The food administration has suggested that merchants should give the advantage which he deserves to the customer who pays cash and delivers his own groceries. The invariable custom in the past has been that the customer who delivered his own groceries paid the same price as the credit buyer who asked for delivery. There is sometimes as much as 15 per

**THIRD LIBERTY LOAN**

Fifteen Million Subscribers; Four Billions Subscribed "That Government of the People, by the People, and for the People, Shall Not Perish From the Earth."

only slightly over our minimum as a district, but even in that we exceeded the New York district whose percentage was 101. San Francisco City exceeded its minimum by more than \$4,000,000; Los Angeles City, by more than \$9,000,000, and every county in the state is entitled to an honor flag.

It was a wonderful campaign and shows that America is in the war for peace. Next will be the campaign for the Red Cross; following that, another for the Y. M. C. A., and all the time we are buying war savings stamps.

It all costs money, but we are still getting off wonderfully cheap. In England the costs have piled up until one with an income of \$2500 contributes, not for bonds but in straight war tax, \$750.

Be cheery and smile even if it hurts. When peace comes we'll all be proud of ourselves. Billions for Liberty but not one cent for tribute.

**NEXT YEAR**

David Lubin, delegate of the United States to the International Institute of Agriculture at Rome, is looking ahead. He has seen the forced levy on the wheat fields of the Ukraine and the supply of food which it will give to the Central Powers, but the productive power of the countries of the Allies, excepting the United States, is being reduced every month. The effect of the Ukraine supplies on the morale of the armies of the enemy has been great. This must be counteracted by the Allies, or, in other words, by America alone. The armies and the non-combatants of the Allied countries must have vastly more than the exportable surplus which we will have from this year's crops. Mr. Lubin recommends:

As a means toward this end I would suggest that each state in the Union,

cent difference in the cost of doing business on the cash and carry plan and the old credit plan. The smallest difference in price would be estimated at one-tenth of one cent per pound on sugar, ranging from that up to ten, or possibly 15, per cent on other commodities. The farmer who pays cash should have the advantage of this difference in price for he often pays cash and always does his own delivering.

**AN AWAKENING NECESSARY**

At the beginning of the war Lord Kitchener said: "Either the civilian population must go short, of many things to which it is accustomed in times of peace or our armies must go short of munitions and other things indispensable to them."

And that is just a little bit truer today than it was when uttered, and it is a whole lot truer in the understanding of all the peoples of the world, and especially of America. At the beginning of the war we quickly puffed up and proclaimed our willingness to undergo all kinds of sacrifices, yet it was with a most distinct shock that we finally began to appreciate that sacrifice meant sacrifice. Producers of foods have decreased in such numbers that an awful problem faces the world. Those engaged in military service are consuming vastly more than they did before the war, and from the very nature of things this condition must continue or even grow more serious.

Efficiency is the demand of our army, and there is but little time or proper conditions on the field of battle to stop and discuss little economies. Until the mass of us who are behind the man behind the gun can appreciate the necessity of our saving more and producing more there will be no thoroughly efficient war prosecution.

**This Week's War Notes**

The liberty bond drive resulted in a billion over the top.

Germans are using a new form of liquid gas against the American troops.

Bolshevik demands that both America and French consuls at Vladivostok be recalled were denied by the American embassy.

It is declared that the submarine campaign will be still fiercer for it is understood that orders have been given; "Sink everything seen."

Many Pacific Coast homes have been saddened by the drowning in tide rip at Ocean Beach near San Diego of 13 men from Camp Kearney and from the naval air station at North Island.

An agreement has been reached on the bill extending the selective draft law to men who have become 21 years of age since June 5, 1917, and it is expected to receive ratification by both senate and house.

Early in the week it was rumored that the pope had been invited by Germany to present peace proposals, but church officials have denied this rumor. It is known, however, that the Central Powers are extremely anxious to secure a mediator.

The Austrian drive in northern Italy has been sufficient to attract much attention, but as yet has not exhibited any great force. Austria is having internal troubles which are requiring no little attention. Bread riots on land and mutinies on sea are of daily occurrence.

England is giving Zeebrugge another case of nerves by bombarding from airplanes, in fact, these raids were carried out from April 29 to May 5, and it is known that many direct hits have been made. One British machine has been lost and at least one large Teuton airplane has been sunk.

One local war effect has been the reduction in train service. Seven fast trains between the Pacific Coast and Chicago will be taken off June 2. On the same date passenger fares will be advanced to three cents per mile. Mileage, tourist and excursion tickets of all kinds are withdrawn and cancelled. Suburban or commuter's tickets are the only ones which will be allowed to be sold under full one way fare.

While it is perhaps not possible for Russia's condition to become any more chaotic, the awful helplessness and inability even to know what she wants is becoming more and more apparent. The Black Sea fleet has been given over to Ukraine or possibly, according to some rumors, turned directly over to Germany. One rumor referred to the crews rebelling and forcing the vessels to leave the harbor of Odessa, but later the vessels were returned and transferred so as to be practically under control of the Central Powers. Rumors prevail regarding uprising of royalists, of republicans, or pro-German sympathizers, and other rebellions, but no one man or party seems strong enough to make a united country.

The boomerang effect of the great Hun drive into Flanders and France is appearing. Allied artillery, infantry and aviators are uniting in bringing pressure on every salient which has been driven into their lines. The Huns are making occasional attacks but often, as on last Tuesday, airmen discovered massing of troops for the drive and Allied artillery has dispersed the attack before it is ever made. Ypres and Amiens have both been fearfully battered and practically all civilians have deserted those cities, but as a strategic stronghold they are still in the hands of the Allies and they are grimly saying: "We will retain them." United States reinforcements are arriving daily and every day sees the Allied lines strengthened.

# Agricultural News Notes of the Pacific Coast

## Northern California

Nevada County dairymen are building silos.

Tehama County farm bureau will hold a patriotic meeting July 4 at Los Molinos.

Sutter County's first annual farm bureau picnic was recently held near Live Oak.

Nevada County's pear orchards now promise immense crops. The frost did no injury.

Napa Valley dairymen are contemplating a change from butter fat to milk production.

Sonoma and Marin County sheepmen have agreed to pay 12 and 12½ cents for shearing.

Farm Adviser Baade of Napa reports tent caterpillars working havoc in prune orchards.

Amador County has almost its entire wheat crop in storage because of lack of transportation.

Supervisors of Butte County have investigated as to crop conditions and report as to hay and grain bumper crops.

Farm Adviser Jones of Eldorado County is urging farmers mutual insurance to cover that county, Placer and Nevada.

Contra Costa County is hoping for early completion of gaps in the state highway in the neighborhood of Crockett, Port Costa and Martinez.

Examination as to qualifications of candidates for horticultural commissioner of Eldorado County will be held at Placerville court house, May 28.

At a meeting of the Union farm center of Napa County a committee was appointed to determine as to the advisability of building a farm center hall.

The Sutter County farm bureau is asking "What shall we do with the hoboes?" and they have put the answer to the question up to a committee of three.

Range cattlemen met recently at University Farm and discussed with representatives of the forest division as to more complete utilization of forest reserves.

Farmers gathered at Marysville and discussing the labor question urged that as a war measure all saloons should be closed and that eight months term for schools be advocated.

Volunteer agricultural workers are being recruited in San Francisco, largely young men from the high schools. The first unit of 175 recently went to Sonoma County cherry fields.

Oroville, Butte County, hopes to become the home of a vegetable oil factory which will handle products heretofore manufactured in Germany. Peach kernel oil is one of the manufactures contemplated.

Humboldt County has shipped a quantity of Humboldt grown and dried potatoes to the quartermaster's department at Fort Mason. If the product proves satisfactory large production is possible in that county.

Pig clubs have been organized among the high school boys in Glenn County and in Chico. James Mills Orchard Corporation, Butte County Ranch and the Anchorage Farm have supplied the pure bred Berkshire hogs used. Some grades and pure bred Durocs have also been used.

## Central California

Tulare cannery will double its output of tomatoes.

Tulare County Grange held its annual picnic on May Day.

San Joaquin Valley hay makers are keeping the mowers busy.

A hog census of Santa Cruz County shows an increase of 746.

Shafter, Kern County, has organized a potato growers' association.

Tulare creameries recently made a payment aggregating \$146,000 worth of checks.

Tuolumne River is still flowing full banks and pouring its waters over La Grange dam.

Portuguese dairymen of Stanislaus County have organized to protect the interests of the members.

Merced County is already planning for a community fair to be held at Atwater, September 13, 14.

Watsonville, Santa Cruz County, has formed a farm labor office under direction of Farm Adviser Washburn.

Drying winds have materially decreased the tonnage of hay and grain fields of, much of the San Joaquin Valley.

Stanislaus County farm bureau is discussing organized fire fighters, with a definite scheme of field fire control.

California Peach Growers will erect a sawmill and manufacture box shooks. The mill will be in Tuolumne County.

The California Creamery Operators' Association is joining with dairymen in the effort to secure competent dairy help.

Oakdale and the south San Joaquin irrigation districts have appealed to the secretary of the interior for financial aid in building reservoirs.

Tulare and Kings Counties are uniting in a patriotic rally on May 11 and 12 at Mooney's Grove. Governor Stephens and other notables, including 40,000 Central California people, will be present.

Manager Niswander of the California Peach Growers has accepted work with the national food administration. He will have supervision over raisins, evaporated and dried fruit of all kinds.

Oakdale, Stanislaus County, merchants have united in an agreement not to handle wheat nor any other product of wheat during the period of the war. This includes macaroni, breakfast food or anything containing wheat.

A cooperative fruit plant costing \$250,000 is to be constructed at San Jose by Santa Clara Valley orchardists. It will have capacity of 1,000,000 cases of fruit and vegetables. There are 13 acres of land to be covered or used by the plant.

The Raisin Day celebration to be held in Fresno and other San Joaquin Valley points on April 30 will make much of military features in the parades. The committee reports that this season's observance will be "something different."

San Joaquin Valley peach growers who signed up five and ten year contracts are appealing to canners for relief because of cost production during the past year and probable cost during the coming years ruining growers who stand by their contracts.

## Southern California

Bean planting is under way in every bean planting section.

Liberal plantings of Sudan will be made in Southern California.

Ventura County goes over the top with 190 per cent of her liberty loan.

Imperial County cow testing association reports 54 cows exceeding 45 pounds per month.

Gardena, Los Angeles County, is sending out 20 to 30 carloads of strawberries weekly.

San Dimas, Los Angeles County, expects to have a marmalade and jelly factory in full operation by July 1.

The Imperial Valley Milk Producing Association contemplates taking over and managing two creameries.

Lancaster, Los Angeles County, expects to ship a vastly greater tonnage of hay than any preceding year.

H. J. Ryan of the bureau of entomology laboratory at Alhambra is investigating control of the tomato worm.

The W. J. Busch Citrus Products Company near San Diego expects to manufacture a large quantity of peach kernel oil.

Farm Adviser Coit estimates the planting of 40,000 acres of beans in the San Fernando Valley of Los Angeles County.

Los Angeles police court records show that arrests have fallen off two-thirds since the saloons were wiped out on April 1.

The Riverside County horticultural commissioner is aiding Coachella onion producers in perfecting the standardized pack.

While Southern California will be short in its sugar output, it is now anticipated the output of the country in general will be normal.

Hemet and San Jacinto, seriously injured in an earthquake April 21, are being given financial aid in restoration by nearly all sections of California.

Hog raisers of Imperial Valley met at El Centro by invitation of Farm Adviser Sullivan and discussed organization in the interests of better marketing.

It is expected the Prune and Apricot Growers' Association will purchase a large packing house at Santa Paula and perhaps other Ventura County points.

Hemet and San Jacinto, which were so seriously damaged by the earthquake, are being aided by Red Cross and public spirited people of many sections of California.

Sugar factory people are moving from Chino to Oxnard. It is rumored the Chino factory will not run and that all the American beets will be worked through the Oxnard factory.

The largest market and produce handling section in the world is now located in Los Angeles, corner of Seventh and Central Avenue. It has cost millions to construct, and some of the largest produce handling institutions in California are located in it.

A 30 year old Italian cypress is being moved from a Los Angeles County nursery to a Santa Barbara millionaire's grounds. The tree, 80 feet, with its boxed roots, weighs 14 tons, requires two flat cars to carry it, and took a house mover's gang of 14 men several days to hoist and place on car. The moving will cost hundreds of dollars.

## The Coast and General

Nevada sheepmen are paying 15 cents per head for shearing.

Hawaii is distributing parasites of the fruit fly and corn leaf hopper.

A \$75,000 milk condensary has been installed at Independence, Oregon.

The rainfall on the Island of Oahu, Hawaiian Islands, is approximately 32 inches per annum.

The sugar crop of the Hawaiian Islands will be 30 per cent larger in 1918 than any previous year.

Idaho reports many of its wheat fields showing 75 per cent better condition than a year ago this date.

During one month recently Hawaii received 2600 bags of rice and 1200 bags of beans from Japan or Oriental ports.

Dairymen of Lewis County, Washington, are organizing for the improvement of the dairy industry in Chehalis Valley.

Sisal fiber is being produced in the Hawaiian Islands, now approximately 500 tons annually; in 1911 only 151 tons were produced.

Porto Rico pineapple shipments are being made by allotment on the basis of acreage because of shortage of ships to carry the fruit.

The Tacoma, Washington, Poultry Association recently held its 29th annual meeting. Dates for the next show are December 31-January 4.

Members of Puyallup and Sumner fruit growers' associations will pay 20 cents per crate for picking raspberries. This is 15 cents higher than last year.

Packers of Skookum apples recently met at Seattle and elected officers for the coming year. The president is J. A. Warman, and secretary, H. J. Olive, of Cashmere.

A large number of meetings are preceding the grain harvesting in Washington, at which series of lectures and illustrated talk on the control of smut explosions is being made.

Oregon live stock people are appealing for control of poison larkspur. Many Oregon cattle have been killed by this weed this year, and it is feared the losses will be greater than any other season.

The Cattle and Horse Raisers' Association of Oregon has petitioned for the enactment of a state law along the same line as the Idaho law, providing for "priority range rights" on the part of cattlemen.

The planting of potatoes along the Atlantic Coast has been very greatly reduced over that of last year. Carlot shipments from Florida and other southern points have been made for more than a month past.

Dealers assert that the consumption of sauerkraut has decreased 75 per cent since the war started. In the interest of cabbage growers the movement has been started to change its name to "liberty cabbage."

After giving permission for three ships for immediate grain shipment to Holland comment of certain Dutch newspapers became so caustic that the United States has withdrawn the offer of the ships until such comment is recalled.

Arizona cotton growers, who held for the big spring prices, made a mistake this year, for instead of getting the usual increase ten or 12 cents has been knocked from earlier quotations, and long staple has been selling around 66 cents.

## You Don't Want "Cheap" Overalls

First place—it's foolish economy to think you can get along with overalls that haven't the stuff in 'em—that can't stand the gaff—that "peter out" on the job.

Besides—"cheap" overalls can never give the comfort and service and value you've always had from your favorite overalls—Boss of the Road.

Every time you buy Boss of the Road Overalls you save money. Look for the Bull Dog on the label. It's your protection. Never has this trade mark meant so much to you as it does today.

Buy them from your local dealer.

## Castor Beans for Airplane Oil

The California Castor Bean Association, authorized by the United States Government to see that 10,000 acres of California farm lands are planted to castor beans, announces that only approximately one thousand acres remain unallotted. It is desired that this acreage be distributed over as wide an area as possible. The castor beans are to be used in making castor oil with which to lubricate airplanes.

## A Few Timely Suggestions for the Vegetable Garden

Written for California Cultivator By John N. Gardiner

**M**ANY small plants, such as tomatoes, peppers, eggplant, sweet potatoes and the like, die shortly after transplanting when this is done early in the day, due to the excessive heat of the sun. This condition has been specially noticeable the past week, when we were visited by some very hot days. Much loss of this kind can be averted if the transplanting operations are confined to the late afternoon or early evening so that the plants will have the benefit of the long cool night in which to recuperate. Now that our evenings are an hour longer, it is possible for the amateur gardener to do this kind of work after business hours and before nightfall. The ground may be prepared any time and the places marked where the plants are to go, thus saving all the time possible for the actual planting. After the plants are set a bowl should be made around them and filled several times with water. When the water has soaked in for the last time the dry earth should be drawn about the plant, thus conserving the moisture and keeping the roots cool. The following day it will be noticed that there is practically no wilting at all, as the long cool night will have fortified the plant to withstand the rays of Old Sol. It should be borne in mind that moisture is continually passing up the stems of plants into the foliage, where it evaporates to a greater or less degree depending on atmospheric conditions. Hence it follows that during a very hot spell, if a newly set plant is subjected to this severe strain, when its roots have not connected up with the soil, it is very apt to perish.

Another thing. During our very

long dry spell this season, the ground dried out to a considerable depth so that when rains came they in turn soaked in, leaving the upper portions of the soil very dry. Up to this time we had no further rains to carry on the good work and so in most cases must depend on irrigation. This condition will not affect well established trees or large plants whose roots already deep are enjoying the moisture of lower strata. This summer will be one to specially emphasize the good results of having plenty of humus in the soil, which acts like a sponge to retain moisture and liberate it as required by the growing plants. All weeds and garden refuse should be carefully preserved and turned under whenever and wherever possible, and should not be piled up to dry out and be later burned. If you can secure weeds, grass or wild grain from adjacent premises, it will do no harm to cut it down, pile it up on your ground several inches deep, thoroughly wet down and turn under with fork or spade. Old straw or litter from the stable is excellent for this purpose.

Do not forget the Kentucky Wonder bean, which is a very prolific bearer and at the same time one of the most easily grown of all vegetables. It will grow almost anywhere, and with a few sticks or strings for the vines to run upon, you will be surprised at the number and quality of the pods produced when only ordinary care and attention are given.

During these war times nothing should be wasted, and with the longer evenings coming between now and the middle of June, each one of us wherever possible should have something to show as his share of food production and saving.

## Liquid Fire for Crop Destroyers

Written for California Cultivator By Jas. A. Brown

**D**ESTROYING the grasshopper pest of San Bernardino County by means of a distillate flame spray is proving so successful that County Farm Adviser H. F. Bahmeier believes it is only a matter of time and application until this pest will be entirely eliminated from this vicinity.

Last year a vast amount of damage was done the hay crop by a vast swarm of grasshoppers and the cry for relief went forth accordingly. Mr. Bahmeier looked up all the grasshopper literature he could find and then acted. The larvae or eggs of the grasshopper are laid generally in colonies in sunny spots adjacent to the hay fields. It takes about ten days from the time the larvae are hatched until the young hoppers are able to move about sufficiently to obtain their

own food. The plan of attack, therefore, is to catch them before they leave their nests or colonies.

With a crew of some 15 ranchers and armed with a number of distillate sprays, Mr. Bahmeier made his first attack on the Los Flores ranch near San Bernardino, which was one of the heaviest sufferers last year. As soon as a colony was spotted, the men moved through it sending out the flaming spray over the jumping insects and leaving behind a trail of baked hoppers. The trial was completely successful and in the first day's drive several hundred acres were covered, nearly a hundred nests or colonies being destroyed. So completely were the hoppers eliminated that the ranchers are preparing an extensive campaign and plan to rid the entire county of the injurious pests.

## Adaptability to Climate

Written for California Cultivator By Ernest Braunton

**W**E HEAR much at times on adaptability of plants to sections where the climate is or has been quite different from that of the plant's native heath. But we should remember that climate is constantly changing everywhere even though the change is but slight. I personally know of sections of California that at one time were health resorts noted for the lack of humidity in the atmosphere, and therefore recommended to those suffering from lung and throat troubles. When irrigation commenced, troubles of various sorts also begun, though irrigation was a great boon to the section financially. In one part of the state where I lived for six months no fogs were seen until years after irrigation was introduced; it was a noted resort for asthmatics. Twenty years later fogs were common and so hugged the soil that one could scarcely see his feet. From a health resort it changed to the reverse, and with water ditches and

mosquitoes came chills and fever, ague, and other troubles until these were more prevalent than in any other part of the state and the district was avoided by people in all walks of life.

This much is recorded to call attention to the fact that vegetable life is affected to the same degree as human or other animal life. Crops in this district have entirely changed, and those proven impossible of healthy growth many years ago are now their chief output. Live oaks did not grow there naturally and would not flourish there in early days. Now the atmosphere is so charged with moisture that they positively flourish and are not exceeded in this respect by any in the state. Yet many persons persist in asking why Quercus agrifolia is called the "Coast Live Oak" when it will grow vigorously far inland. The answer is that the climate has changed; the oak and its natural demands has not. Its natural range was along the coast only. All

of Southern California was once practically a desert, but water has changed it to a paradise. Every year the climate is more and more modified by its use. Plants that could not be grown except in favored spots when I came here in 1887 are now fairly common. Particularly is this true of Los Angeles. Then lawns and gardens were few. Now the tens of thousands of lawns in thousands of acres, with water applied to these and other crops, not only in the city, but to all lands surrounding, has greatly modified the climate. The summers are now made more cool, especially during the hottest months, by the great areas covered by cooling vegetable growth. This influence has also greatly modified the climate in the Imperial, Coachella and San Fernando Valleys. In the latter vast stretches of miles of sugar beets, beans, etc. have so cooled the summer air that I notice the change each time I drive through in midsummer. Woodlots, orchards, street trees, and well planted gardens have contributed their share and have also arrested the surface winds to such an extent that spots once disagreeable over many months in the year have now become delightful all-the-year residence sections. Each year hence will record favorable advance and change.

## The Best Tree

The question is often asked me: "What is the finest one tree for general purposes, for street and yard planting, for both ornament and shade?" Sometimes I am asked: "What is the most beautiful evergreen shade tree?" To all of these there can be but one answer—the live oak. *Quercus agrifolia*, the Coast live oak, is, in my opinion the handsomest, most satisfactory ornamental shade tree possible to grow in California. Others may better meet some special purpose, but none can surpass for general use. Each year its beauty, its adaptability, impresses me more and more. Among introduced trees, and standing next to the live oak in any list, is the grand pepper tree, and under some conditions it is superior to the oak. The cork oak is also a splendid tree and should be more freely planted.

## Most Drouth-resistant

While on a foothill ranch of great extent last week I asked the owner of this more than a thousand acres what plant made the best growth under the hardest conditions. He pointed to a Spartium junceum, or Spanish broom up on a steep hillside and remarked how splendidly it was blooming, how large it was for its age, the fact that it was self-sowing and young plants each year grew beneath the parent shrub. He then stated that over a score of years and with several hundred species of plants, none could equal this record and that the little plant had been set out one autumn, watered once and left to its fate. The soil where it grows is largely loose decomposed granite and but a few inches deep. In some catalogues this shrub is erroneously listed as *Genista Hispanica*, a name which means Spanish broom.

## A Good Shrub

There is a broom grown in local nurseries that goes by the name of *Genista fragrans*, properly a cytisus, that is of quite a different class from the Spanish broom. It is one of the most vigorous of all the group and in good soil makes a very fast and satisfactory growth. It is also the most free in flowering habit of any broom we have in the local market. No mistake will be made if this fine shrub is freely used in parks and gardens in all parts of California.

A writer in the New York Times expresses something that must have been in the minds of many other thoughtful Americans: the futile and even pernicious character of many of our war cartoons. The Kaiser or the Crown Prince or Hindenburg or Tiritz is represented as kicked off a precipice or pulled under the sea or spitted on an American bayonet. It may amuse us and certainly does gratify our sense of the fitness of things; but it does not help us to win the war, and it does foster a sense of complacency and tends to make us boastful. Fewer pictorial predictions about what we are going to do and a wider recognition of what others have done and are doing would be more becoming.—Youth's Companion.

# Right Back—Down Same Row —Remarkable Tractor Performance!

**Make Tractor You Buy PULL TOOLS Around  
Short Turns. Get FREE TRACTOR BOOK NOW.**

STRAIGHT-AWAY plowing is not a complete tractor test. "Acrobatic" turning stunts without tools is no test. Watch the Bean TrackPULL Tractor PULL TOOLS around short turns, doubling back in the same row, cultivating around a tree right under the lowest branches with the tools down deep, and no strain on the tractor anywhere. Our wonderful PATENTED FRONT DRIVE FEATURE permits the TrackPULL Tractor to use full power and pull full load just as easily on right-angle turns as on straight-away with no pivoting and no overload on one wheel or track. If you want a tractor for an orchard or a vineyard or for efficient field work you'll want the Bean, because the Bean is the only tractor built to perform these necessary feats. The patents are built right into the tractor and cannot be imitated.

The Bean exerts all its power through a single track and you "gee" or "haw" this track to steer. Ten-year-old boys turn this tractor all the way around inside a ten-foot circle (6-foot radius) with perfect ease. When you hit soft spots you simply throw the track over and pull out just the same as

with a team. No digging in deeper. "Almost animal intelligence", some users say.

Don't make mistake of buying a tractor until you've seen these features demonstrated and proved. You'll save money by buying a tractor like this and you'll save time and trouble which is just as good as a cash saving.

Don't wait. Get the Bean catalog now, note the price; and learn the name of the nearest demonstration agent, who will give you a true demonstration (no tricks or "acrobatic" stunts) to show you what a tractor ought to do on your place.

Send in this coupon now before you forget it.

## Making Jack Cheese

WE HAVE had many requests for information as to home made or dairy made cheese. Dairymen without possibility of economical delivery to creameries are sometimes at a loss to know how to handle their products to secure greatest returns. This has been one cause of California's introducing "Jack Cheese." Regarding this cheese W. H. Roussell wrote a few months ago in the Pacific Dairy Review as follows:

"This cheese was originally made in Monterey County about 25 years ago in small quantities, but after it was found to sell well other counties started to manufacture it. As Monterey was the first county to make this kind of cheese, it was named 'Monterey' cheese, but a maker of this cheese suggested that it be given a more distinctive name, and consequently it was called 'Jack' cheese. No one objected to its being called 'Jack' cheese, and all have accepted it as its true name. The cheese is made mostly by Portuguese and Italian-Swiss people, although some of the best of this cheese is now made on a ranch near Modesto.

"The particular value of this cheese lies in its being adapted to making on small dairy farms, its fast and cheap process of manufacture with little equipment. The cheese being small and portable is adapted for home and family use without having to be cut into small portions."

Regarding method of making Prof. H. S. Baird of the University of California gives the following information:

### Method of Making

Jack cheese is made every morning from night's and morning's milk. The mixed milk should not test higher than 0.16 per cent acidity and should have a clean flavor. Standardize the milk to 2.1 or 2.2 per cent fat. Heat the milk to 86 degrees Fahrenheit and add 0.5 to 1.0 per cent commercial starter (clabbered milk). Add sufficient rennet, about six ounces per 1000 pounds milk, to curdle the milk ready for cutting in 25 minutes. Dilute the rennet about 40 times its volume with cold water before adding. The time for cutting is determined by the same method as for Cheddar, testing the curd for firmness. The curd is also cut in the same manner as for Cheddar. After cutting the curd should be allowed to stand a few minutes before stirring; then stir gently with the hands. Stir the curd sufficiently during the cooking process to prevent matting. The heat should be applied ten minutes after cutting and the temperature raised to about 110 to 112 degrees Fahrenheit in 35 minutes or at the rate of about 3½ degrees in five minutes. It will take about 35 to 45 minutes to firm the curd after it reaches the maximum temperature, but the only method for determining the time for dipping should be the firmness of the curd. The curd should be slightly rubbery but not so firm as curd for Cheddar cheese. The whey is removed and the curd stirred sufficiently to remove the excess whey. Too much stirring injures the curd; do not handle it roughly. Salt is added while the curd is warm at the rate of three pounds per 1000 pounds milk and after it is thoroughly mixed and dissolved the curd is ready to press.

### Molding

The press cloths used for molding these cheese are made of heavy sheeting and are about 34 inches square. The cloths are laid out evenly, one over the other, and are spread over the top of a large open pail. Push the center down to the bottom of the pail leaving the edges hanging over the sides. Sufficient curd (about seven pounds to make a six-pound cheese is weighed out and poured into the top press cloth. The four corners of the cloth are caught up with the left hand, while with the right hand the curd is formed round and the cloth straightened. The cloth is now taken up tightly over the curd with the left hand, while the cheese is given a rolling motion on the table with the right hand, pressing at the same time to expel the whey. This twists the press cloth tightly over the curd where it is tied with a string. The excess cloth is spread out evenly over the top of the cheese and it is then ready for the press.

### Pressing

The cheese are pressed between two wooden planks, 12 inches by 1½ inches surface; the length will depend upon the number of cheese pressed or the size of the room. The first board should be laid with a slight slant to allow the whey to drain off readily. These cheese are then placed in the center of the board about one inch apart after which another board is placed on top. If necessary the cheese can be placed four or five layers deep if a board is placed between the layers. Best results can be gotten by placing the boards and cheese in an ordinary upright cheese press. Another method is to brace the first board, near a wall, about three feet from the floor; then level with the top board a lever (two by four, five feet long) is fastened to the wall with a hinge which will allow it to be raised or lowered. These levers, one every four feet, are laid over the top board and a weight (100 pounds) is fastened to the other end. This acts as an automatic press. The cheese are left in the press about 15 hours, after which they are removed, the press cloths taken off and the cheese laid on the shelves. If the press cloth sticks to the cheese, pulling out pieces of cheese when removed, this indicates that the surface gets too dry while in the press. Water thrown on the cheese occasionally or the room kept moist will prevent this. In about two days after removing from the press the cheese should be dipped in hot (200 to 220 degrees Fahrenheit) paraffine and held there for ten seconds. This will prevent shrinkage and gives the cheese a neater appearance.

### Half Skim Jack Cheese

Milk used for half skim Jack cheese should test 1.8 to 2.0 per cent fat. The night's milk may be skimmed and the milk mixed with an equal amount of morning's whole milk. The rate of rennet extract should be decreased sufficiently to curdle the milk ready for cutting in about 45 minutes. The cooking temperature should be lower; about 104 to 106 degrees Fahrenheit and the whey should be removed when the curd is about the same firmness as for full cream Jack. The cheese should not be paraffined as they are usually dried for grating purposes.

## The Banker and the Pure Bred Sire

There are still many places in California where it is not at all easy for a man to secure accommodation at his bank if he wants to use the money for the purchase of dairy cows. If he wants to buy feeder cattle the money is forthcoming, for the banker has been trained to that form of loan and can estimate the hazard of fattening a bunch of cattle for a turnover that will be made within a period of a few months. But gradually the bankers of the state are learning that the dairy cow is the ready cash proposition that helps to finance the entire business of a community. Instead of bringing in cash once a year the dairy cow brings it in every two weeks, or at most every month. Thus the dairyman becomes a cash buyer

and is not compelled to secure long time credit from the grocer, the feed man, and the hardware and implement man. This in turn lessens the credit that the local bank is called upon to extend to these lines of business and releases that much cash to the uses of other lines, including more liberal loans on farm lands and dairy cattle.

But the banker is interested in the business ability of his dairyman client the same as he is in the ability of any other business men who applies for a loan. He wants to know what sort of equipment the dairyman is using in his operations, including land, bullocks, cattle, and machinery, and has particular interest in the kind of cattle the dairyman owns and breeds, to

## Field Notes from the Live Stock Men

Bridgeford Company, Knightsen, is keeping up the wonderful work started at the beginning of the present test season in their registered herd, having now developed eight cows since January 1 with records above 30 pounds butter in seven days, and a remarkable group of two year olds.

The most sensational performance in their herd lately is the record made by the cow Boweda, who has increased her former record of 31.91 to 37.50 pounds butter in seven days and she is still on test. A new state record junior two year old was uncovered in the last group to go on test, this being

the heifer Tulip Walker, a daughter of King Walker 5th and out of a 22 pound four year old daughter of Korndyke Butter Boy Johanna. Freshening at two years one month she made 26.51 pounds butter from 495 pounds milk in seven days. The senior two year old Tora Pontiac of Vina, a daughter of King of the Pontiacs 14th, made the very nice records of 24.68 pounds butter and 508 pounds milk in seven days, and practically 100 pounds butter from 2110 pounds milk in 30 days. Woodbine Rosa Pearl, a five year old granddaughter of King Pontiac Champion, made 30.52 pounds butter from 742 pounds milk in seven days. This record is given especial prominence through the fact that eight daughters of her grandsire have made over 30 pounds butter in seven days since January 1, 1918, a performance unequalled by the daughters of any other sire in the same length of time. Jessie Fobes Maida, a mature cow sired by a son of De Kol 2nd's Butter Boy 3d and out of a 25 pound granddaughter of Paul De Kol, Jr., made 31.55 pounds butter from 622 pounds milk in seven days. The remarkable average of 23.23 pounds butter in seven days for the entire number of two year olds tested in the herd this spring, is a feature that has probably never been equalled in any other herd on the coast. All of these were junior two year olds except one, and the average age for the nine head is two years two months.

The Guernseys have a new champion. Brookmead's Dorothy 55715, a two year, four months Guernsey owned in Pennsylvania, has a new breed record for cows in her class. She produced in one year 14,179.4 pounds milk and 742.08 pounds fat.

The Holstein-Friesian cow Superba Palmyra 314141, a twin, has broken the fat production record in the junior three year class of the seven day division. She produced 655.1 pounds milk, 30.678 pounds fat. She freshened at the age of three years, five days. On the 80 per cent basis her production is equal to 38.35 pounds butter.

Hollywood Farm, Hollywood, Washington, has an outstanding class of cows and heifers on test now. Two daughters of King Palmyra Fayne have just finished with 31.36 and 32.4 pounds butter in seven days respectively, the latter having previously been consigned to the big Milwaukee sale in June. This gives King Palmyra Fayne three daughters above 31 pounds. Another great record is being made in the herd by a senior three year old daughter of the 32 pound cow Lilith Queen Pauline. She is going at a 34 pound gait with chances of finishing above that mark.

Miss Valley Mead De Kol Walker's complete record, covering only 339 days as a junior three year old, is 21,975.8 pounds milk and 1114.66 pounds butter. She has earned a rest which she may be given this year, after dropping that wonderful bull calf by Sir Aaggie De Kol Acme. She is owned by A. W. Morris & Sons, Woodland.

The Completed Entries for the Fourth Sacramento Sale, show a total of 125 registered Holstein cows and heifers and 15 registered Holstein bulls. California Breeders Sales and Pedigree Company, who will manage the sale, report that they consider these cattle to be unquestionably the best ever offered in a two day sale in California.

Winnie Korndyke Cornucopia De Kol, the great Holstein cow owned by The J. S. Gibson Company, Williams, recently dropped a fine bull calf by Prince Alcartra Korndyke. This youngster has a world's record average for milk production in one year for dam and sire's dam, the two averaging 30,742.7 pounds milk and 1195.73 pounds butter. The average for his dam and sire's dam in seven days is 786.3 pounds milk and 34.75 pounds butter. This youngster will stay in the Gibson herd as junior herd sire.

Hengerveld De Kol Segis Cornucopia, a two year old heifer at Tulare Holstein Farm, owned by W. J. Higdon, Tulare, is on test and has 19.44 pounds butter and 448.2 pounds milk to her credit in seven days. She is a granddaughter of Pietertje Hengerveld Segis, the only living century sire. In the same herd Wayne of Rock made 26.31 pounds butter and 540.8 pounds milk in seven days, 108.63 pounds butter and 2497.4 pounds milk in 30 days. Coloma Beauty Maid, the good three year old bought from Alex Whaley made 98.46 pounds butter from 2258.6 pounds milk in 30 days. Hertinga Willis has now been on test 60 days and has 194.78 pounds butter and 4886.4 pounds milk to her credit, and Thelma Hartog De Kol has 119.63 pounds butter in 2655.8 pounds milk to her credit in 30 days. The great two year old Madrigal Mooike 2nd made 158.43 pounds butter from 4540.8 pounds milk in 60 days, and 240.58 pounds butter from 6770.2 pounds milk in 90 days, and is now milking from 73 to 75 pounds per day. A fine lot of daughters of Prince Riverside Walker are coming on in the herd, and these calves are one of the big hopes for the future in this splendid herd. Herdsman Harry L. Redd has plenty of work cut out for him with the regular line of good cows and heifers yet to freshen and go on test.

Leafy Veeman De Kol 151480 has shown a production of 589.7 pounds milk containing 32.079 pounds fat in seven consecutive days. She freshened at the age of seven years, ten months, 29 days. Her sire is Duke Wayne Veeman De Kol 51164; her dam is Leafy Dawn De Kol 112845. She was bred by Byron Barstow, Earlville, New York, and she is now owned by Abbott & Clark, Cortland, New

### Santa Anita Rancho Anoakia Breeding Farm Registered Holsteins

Depth of body is a prime requisite in the high producing dairy cow, and is especially desirable when found in combination with other outward evidences of dairy quality. Great deep bodies are outstandingly characteristic in the offspring of

### Merci Lad Korndyke Burke

our senior herd sire, who is by De Kol Hengerveld Burke and out of Winnie Korndyke Cornucopia De Kol, 31,034.1 pounds milk and 1201.00 pounds butter in one year, the first cow in California to produce that amount of butter in one year.

We have a few of his sons, out of good record dams, for sale.

Inquiries or orders by mail will receive careful and prompt attention.

## FOURTH SACRAMENTO SALE

State Fair Grounds, Sacramento, Cal. June 5-6, 1918

# 140 Registered Holsteins 140

Contributed from 9 California Herds:

A. W. Morris & Sons, Woodland.  
Pacific States Corporation,  
Tulare.  
The J. S. Gibson Co., Williams.

Gotshall & Magruder, Ripon.  
Henderson Company,  
Sacramento.  
Bonita Stock Farm, Lodi

Buena Alta Herd, Oakland.  
McAlister & Son, Chino.  
Rosamines Rancho, Riverside.

### Offering a Wonderful Group of Females, including:

ONTARIO BLOND PIETJE, a first class individual and she is a 30 pound junior four year old daughter of a 35 pound sire.

A DAUGHTER OF PRINCE GELSCHER WALKER out of a 27 pound daughter of a 32 pound cow.

A DAUGHTER OF KING SEGIS PONTIAC JENNEK out of a great 28 pound four year old and bred to the 36 pound \$6500 bull King Korndyke Pontiac 20th.

TWO DAUGHTERS OF KING MORCO ALCARTRA, son of Tilly Alcartra.

A DAUGHTER OF PRINCE ALCARTRA KORNDYKE, son of Tilly Alcartra, and she made 729.6 pounds butter in one year as a junior two year old.

NINE DAUGHTERS OF KING KORNDYKE SADIE VALE 27TH, beauties, and out of wonderfully bred dams with records up to over 29 pounds butter in seven days.

THREE DAUGHTERS OF KING KORNDYKE SADIE VALE 22ND, one of them out of May Korndyke, for several years the youngest 30 pound cow of the breed.

THREE DAUGHTERS OF KING SEGIS DE KOL KORNDYKE, out of dams with records up to over 28 pounds butter in seven days.

A 20 POUND THREE YEAR OLD DAUGHTER OF PRINCE GELSCHER WALKER, bred to the 40 pound sire Prince Alcartra Korndyke.

A 26.41 POUND COW and her daughter by Sir Korndyke Veeman Hengerveld, 30 pound son of Sir Korndyke Pontiac Artis.

A DAUGHTER OF ADMIRAL WALKER PRILLY out of a dam that made 847.55 pounds butter in one year as a four year old.

SOME GREAT A. R. O. HEIFERS bred to King of the Black and Whites, the first bull whose seven nearest dams averaged over 30 pounds butter in seven days.

A 22.87 POUND COW well along with calf to King Mead of Riverside.

TWO DAUGHTERS OF KING SEGIS 11TH, who is a 34 pound son of King Segis.

A LARGE NUMBER of cows and heifers not included above, with official records up to over 27 pounds butter in seven days, and bred to such bulls as It. King of the Black and Whites, Colantha Sir Pontiac Aaggie, King Mead of Riverside, Prince Gelscher Walker, King Morco Alcartra, Prince Alcartra Korndyke, King Winnie, Pride Fayne Valdessa, King Sadie Vale Rose, and others of outstanding breeding.

### 15 Bulls will be Offered, including:

SEGIS PONTIAC ABBEKERK, son of Segis Pontiac De Kol Burke and a 34 pound daughter of Changeling Butter Boy, and her dam in turn is a 31.70 pound daughter of Tidy Abbecker Prince. He is a beautiful individual, about ready for service, and one of the best young bulls ever offered in the west.

A SON OF KING KORNDYKE SADIE VALE 27TH out of a 29 pound four year old daughter of King Segis 11th, who is a 34 pound son of King Segis. Here is a combination of the greatest blood lines of the breed, and this young fellow is fit to go into a high class herd.

A SON OF KING MEAD OF RIVERSIDE out of a 26.76 pound daughter of Changeling Butter Boy, and her dam is a 30 pound daughter of Tidy Abbecker Prince.

A SON OF KING KORNDYKE SADIE VALE 27TH

out of a 22.95 pound dam that is three-quarters sister to the 41 pound cow Valdessa Scott 2nd.

A SON OF THE 34 POUND SIRE KING PONTIAC NETHERLAND SEGIS 3D out of a 26.86 pound four year old.

MODEL DOMINO GLISTA, son of the 30 pound sire Model King Segis Koningen and out of a 21.72 pound three year old daughter of the 30 pound cow Glista Cora.

TWO SONS OF PRINCE ALCARTRA KORNDYKE, son of Tilly Alcartra, full brothers, out of a great 24 pound dam.

TWO SONS OF KING PONTIAC SEGIS INKA, one out of a 25.70 pound four year old, the other out of a 25.71 pound three year old.

TWO SONS OF THE 33 POUND SIRE SUPREME GLISTA PIETJE, both out of good dams.

This sale will unquestionably contain the finest lot of registered Holsteins ever offered in a two days sale in California, and a very attractive feature of the sale is the fact that there will be more than 30 fresh cows and heifers, and that a very large percentage of the females are bred to some of the greatest sires in service in the state.

Every animal positively guaranteed to be a breeder, tuberculin tested and sold SUBJECT TO TUBERCULIN RETEST BY THE BUYER, every animal pledged to absolute sale without reserve, limit, or by-bid.

A Sale of Extraordinary Character

York. With this production she is the thirty-first cow to obtain place in the list of Holstein-Friesian cows with productions exceeding 32 pounds fat in seven days. Computed on the 80 per cent basis the equivalent butter claimed for Leafy Veeman De Kol amounts to 40.10 pounds.

H. L. and E. H. Murphy have recently sold two Shorthorn bulls to W. Cheyney of Chico. G. A. Murphy has also sold a Shorthorn bull to the same man.

#### CALVES WHICH MAKE PRIZE WINNING STEERS

**A**N ILLINOIS feeder who has proved grand champion carlot winner in 1910, 1912, 1916 and 1917 and is an enthusiastic Aberdeen-Angus admirer gives the following points regarding feeding and utility:

I want them well bred, and to get that kind I go where well bred ones are. About half of the seven loads I entered at the 1917 International Show were pure breds, though a few of them were from herds that had not kept up the pedigrees. I take a trip out through Iowa and the Aberdeen-Angus districts of Illinois every fall when I start to get together the calves that are to be my entries for the following show. I buy them right from the cow's side.

I want to see the sire and dam if possible, as well as the calf, or if not the sire and dam, as many near relatives as possible. Shape, type and finish all appeal to me in picking out the calves then. I want a calf full of quality and style. I want the head up like a bird, a bright countenance. I want a leg under each corner of the calf, with nice quality in the bone; coarse bone means coarse meat on that bone when the animal is finished.

The top and bottom lines of a grand champion steer prospect should be parallel with a deep body between these lines. The rib must be well sprung, and broken off neat and square at the tailhead. I look for a short neck, well set on shoulders with good style and cut up neat around the throatlatch, so that the finished steer cuts meat to the jawbone.

A short head, wide between the eyes, and carrying a heavy jaw, are characteristics of a good feeder that I never overlook. Neat, small ears, well set up to give a keen, bright appearance, go with an eye like a bird. I look for an oily coat of hair on a loose hide with plenty of stretch. A low flank, with a straight hind leg below, brushed by a short tail, about completes the picture of my grade champion prospect.

Given the breeding and the mating up so that all look like peas, all that is necessary to make the grand champions is to get them home and feed and fit them for the big days when the judges hang the ribbons. As I pick Aberdeen-Angus calves, the proper finish is comparatively easy, as no other breed can be fitted and held up without going bad like an overripe apple if not shown just when they are ready.

"The better bred they are, the better they will feed out. I want to see the sire and the dam to tell what a calf will do when she gets in the feed lot. The poppin' good ones have lots of quality and style like a saddle horse."

#### DAUGHTERS OF KING MEAD OF RIVERSIDE MAKING GOOD YEARLY RECORDS IN HARLAN HERD

A number of daughters of King Mead of Riverside are on yearly test in the registered Holstein herd owned by J. H. Harlan Company, Woodland, and have just crossed the 305 day mark, which is a regular test division instituted over a year ago by the Holstein-Friesian Association of America. All of these Mead daughters are heifers, the oldest being Fidorence Mead, a senior four year old, having to her credit 18,684.3 pounds milk and 778.08 pounds butter in 305 days. For the same period Margie Mooie 2nd, another senior four, has 1494.1 pounds milk and 795.80 pounds butter, Modjeska Crane 3d, a junior three, has 14,900.6 pounds milk and 649.43 pounds butter, and Nadgy Korndyke Mooie 2nd, a junior two, has 12,874.1 pounds milk and 572.28 pounds butter. Nadgy Korndyke Mooie 3d, another daughter of King Mead of Riverside, freshening at two years one month,

made 23.80 pounds butter in seven days, 98.92 pounds in 30 days, and at the end of 90 days has 279.25 pounds to her credit. She will be remembered by visitors at the last state fair as one of the beautiful pair of daughters of King Mead of Riverside for which the Harlan Company refused \$1500 each.

#### "AMERICAN'S CREED" BREATHES PATRIOTISM

"The American's Creed," written by William Tyler Page of Maryland, was a winner in a contest for a \$100 prize, offered by the city of Baltimore. Here it is:

"I believe in the United States of America as a government of the people, by the people, for the people; whose just powers are derived from the consent of the governed; a democracy in a republic and a sovereign nation of many sovereign states; a perfect union, one and inseparable; established upon those principles of freedom, equality, justice and humanity for which American patriots sacrificed their lives and fortunes.

"I, therefore, believe it is my duty to my country to love it, to support its constitution, to obey its laws, to respect its flag and to defend it against all enemies."

We'll substitute corn for wheat and victory for defeat.

#### HAVE YOU BEEN KEEPING POSTED

on the wonderful records made during the past year by daughters of Pontiac Korndyke and his son King of the Pontiacs? This great sire and his great son stand in a class by themselves for proven power to transmit high production, and they are great grandsire and grandsire respectively of our wonderful young herdsire

#### KING KORNDYKE PONTIAC 20TH

who is out of that great heifer, Miss Valley Mead De Kol Walker, holder of two world's records, and who recently finished a test covering 339 days during which she produced 21,975.8 pounds milk and 1114.66 pounds butter, the second highest record ever made by a junior three year old even covering a full year.

A NUMBER OF FARSIGHTED BREEDERS HAVE BRED SOME OF THEIR BEST COWS TO THIS RICHLY BRED YOUNGSTER, AND WE WILL STILL ACCEPT A LIMITED NUMBER OF SERVICES FOR APPROVED COWS.

All we have to sell is a few choice bull calves sired by PRINCE RIVERSIDE WALKER, our senior

herd sire, who is by the same sire as Miss Valley Mead De Kol Walker and out of the same dam as the world's yearly official butter record cow, Aaggie Acme of Riverside 2nd.

Our Entire Herd is Tuberculin Tested

#### La Connor Flats Stock Farm

Owned by J. H. Hulbert, Jr.

Mount Vernon, Washington,

Saturday, May 25, 1918

The sale will contain all of the high producers and the entire show herd that was a sensation on the Northwest circuit last year, eleven of the twelve head in the show herd being the get of Segis Pontiac Acme; numbering in all

#### 90 Registered Holstein Cows, Heifers and Bulls

Some groups and individuals in the sale are:

ORMSBY SEGIS MARIE (shown above) together with her yearling son by Segis Pontiac Acme. The heifer herself is a show individual of very high excellence. Her son is a splendid individual, dark in color, has been bred to some of the good ones in the herd, and is qualified in every way to head a real breeding herd.

A 26.90 POUND THREE YEAR OLD that milked 638.2 pounds in seven days.

A BUNCH OF BEAUTIFUL TWO YEAR OLDS, a number of them with official records up to over 24 pounds butter in seven days.

A TWO TIMES 30 POUND COW and her two daughters.

TWENTY A. R. O. COWS AND HEIFERS with records up to over 30 pounds butter in seven days.

The herd has been tuberculin tested regularly for several years, and has been for some time under Federal test. All animals over six months of age will be sold under Federal test and subject to 60 day retest by the purchaser. Every animal pledged to absolute sale and positively guaranteed to be a breeder under the regular sales rules of this company.

MOUNT VERNON is 91 miles north of Seattle on the Great Northern Railroad. The farm is nine miles southwest of Mount Vernon. The Mount Vernon-La Connor stage meets all trains at Mount Vernon and passes directly past the farm. Comfortable hotel accommodations may be had at Hotel Windsor, Mount Vernon, or at La Connor, which is only one mile from the farm.

## Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Boulevard, Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal. Unsigned communications receive no attention.

### Hog Questions

What is wrong with a hog that shakes all over when walking after

being hauled and sometimes when in the pen? Can anything be done for him?—Subscriber.

This is very uncommon. It may be a form of chorea or may be due to sore feet from founder. Examine the feet and if they are sore bathe them once a day in cold water and give half a teaspoon of nitrate of potash in the feed once a day. Either trouble will not affect the pork.

### Hog Cholera

Are hogs in high altitudes less

liable to have cholera than in the low country?—Subscriber.

Altitude could have little to do with cholera unless it be that there are less hogs kept in high altitudes and therefore less chance of exposure to the disease.

### Inflamed Udder

About two months ago I bought a cow that had been fresh five days. The calf had been with her and she had not been milked. The udder was swollen and the milk was like water and tasted salty. I called a veteri-

caused this and what can be done for her?—Subscriber, Santa Maria.

The inflamed udder and the salty milk would lead one to think that most of the trouble was in the udder. Any one of several things might cause it but I should fear that the trouble was tuberculosis. Some cows never do have any cream in their milk but the other conditions being present would make the milk unfit for any use. Rub the lumps out of the udder if you can. Feed her green and sloppy feed to keep the bowels free and give her some salt. Have her tested for tuberculosis before using the milk.

Riverby Princess

Photo taken by Cultivator camera only a few days before she farrowed nine dandy pigs. These pigs are sired by Baron Duke 201st, the Grand National Champion at Omaha last year. Riverby Princess is owned by W. F. Sandercock, who was standing behind her when she was photographed on his Natomario Rancho near Sacramento.

arian and he did not seem to do her much good. The milk is not quite so watery and is not salty but the udder has large hard lumps in some places. She gave five gallons of milk twice a day but only gives three now. We were told that the former owner sold her because he could get no cream from her milk. We have set it and find that to be the case. No matter how long it sets there is no cream to amount to anything. What has

### Bad Results from Influenza

I have a mare and horse that are work animals and have been at work steadily. Swellings came between the front legs and along the belly. In a few days the swelling in the mare extended to the udder and milk veins and into the flanks. I put hot applications on them and the swellings went away but the horse seemed to have an attack of distemper and now the mare has a swelling on the shoul-

## Remarkable Records! What Do You Think! In One Season 80% above 30 lb. Records

Eight 30 lb., 7 day butter records, from 10 cows tested this season. Records 32.70 lb. from 30.41 lb. to 37.50 lb., average for eight cows .....

*In one season 88% of 2 yr. olds tested, made above 21 lb. butter 7 days.*

Eight from 21.02 lb. to 26.51 lb. butter seven days. Average for eight heifers 23.86 lb. at average age of 2 years, 2 months. All first calf heifers.

We offer for sale at reasonable prices these young bulls by our herd sire "King Segis Alcartra Abbekerk," sire of the \$50,000 bull "King Segis Pontiac Alcartra." Dam 30 pound daughter of the great sire "Tidy Abbekerk Prince," who has nine 30 pound daughters, her record made at second calving.

No. 1—"Segis Abbekerk Alcartra Pontiac"—Born October 3, 1917. Fine individual seven-eighths white. Dam 25 pound daughter "Spring Farm King Pontiac," one of the best sires of "King of the Pontiacs." The nine first dams of this calf average 30.55 pounds butter in seven days.

No. 2—"Segis Abbekerk of Riverside"—Born July 30, 1917. Nicely marked, two-thirds black. Dam's record seven days 25.01 pounds butter, one year 314 pounds butter, 13,362 pounds milk. First ten dams of this young bull average 28.50 pounds butter seven days.

We also offer several younger bulls from 30 pound dams of high class breeding.

Write for particulars, photos and prices.

## **HOLLYWOOD FARM**

**F. S. Stimson, Owner**

**Hollywood, Washington**

der. I also have a year old colt that has a swollen sheath. They eat and drink fairly well and their urine and passages from the bowels are all right. Can you tell the cause of the swelling on the three and give a remedy for it?—Subscriber, Shafter.

Such troubles are often seen following mild cases of influenza. They are serious and do not yield readily to treatment. Light work will not hurt them when they are able to do it but they usually tire easily. Keep them in open pasture as much as possible and feed some grain to keep up the strength. Give the following powders: Two pounds nitrate of potash, one pound ground gentian, half pound powdered nux vomica, six ounces sulphate of iron and two pounds farina. Mix well and give a tablespoon of the mixture twice a day in the feed. Give the colt about one-third as much as the older horses.

#### Stoppage of Bowels

I have a six months old heifer that is in very poor condition. About a month ago her bowels did not move for four days. We called a veterinarian and he relieved her but she does not seem to do well since. Some days she eats well and others not; also some days her bowels move all right and next day not. What can we do for her?—Subscriber, San Martin.

The trouble was probably caused by stoppage of the food in the third stomach. Such cases require continual treatment for some time. Give her these medicines as the directions indicate: Three ounces aloin, 12 ounces turpentine and enough raw linseed oil to make one gallon. Mix and shake well. Give one pint of the mixture every other day. Also mix three pounds of epsom salts with one pound common salt and give a handful of this once a day in the feed. If these remedies make the bowels too loose then reduce the quantity but continue to give a little until it is all used.

#### Paralysis from Injured Spine

I have a heifer with her second calf seven months old. She has nursed it and has been fed straw, volunteer oats and corn stalks. We tied her up to milk her four mornings ago putting rope also about her body in front of hips and udder. She struggled but little but when nearly milked she lopped over quite easily. Since then she has not been able to regain her feet. She can move her hind legs but is able to get up only on her knees. At first she nearly got up but fell over and seems to be more helpless since. She eats and drinks heartily and nurses the calf and there seems to be no soreness of any part. Can you tell me what is wrong and what to do for it?—Subscriber, Tollhouse.

You must have tied the rope very tight. The joints of the spine of a cow are very loose and a little pressure between them will cause paralysis but it seldom lasts longer than the pressure remains. This is the method used to throw cattle for an operation but I never knew one to remain paralyzed after the rope was removed. You should apply a strong liniment over the spine where the pressure of the rope was greatest and warm the liniment in by placing a blanket over the spot and rubbing the blanket with a hot flat iron. When she once regains her feet she will probably be all right.

#### Eczema on Cow

For some time my cow has had some sort of breaking out on the back of her neck, shoulders and front legs, consisting of little lumps and pimples. On her legs it seems to itch so that she keeps them licked raw. Can you suggest a remedy?—Subscriber, Claremont.

The irritation of the skin may be caused by a mite in the skin or from the blood being thick. Give her one pound of epsom salts and a half pound of common salt. Dissolve it in two quarts of hot water and when cool give it at one dose as a drench. Repeat the dose in two or three days. Also bathe the skin where the irritation shows once a day for a week or more with a five per cent solution zeno-leum.

#### Sweeney

I have a horse whose shoulders look badly. They seem to have fallen away suddenly in a place about four inches wide and as long as one's hand. Will you kindly tell me if this is what is called sweeney? Is there any remedy or medical treatment that will restore it? The horse is working as usual and nothing of a bad nature is evident.—Subscriber, El Cerrito.

Yes. It is what is called sweeney and is caused by a strain. At first the muscles were probably swollen some but not enough to be very noticeable. Now that the muscles have shrunk below normal it will require heroic treatment to restore them. About the only treatment that will do it is to inject ten or 15 drops of equal parts of turpentine and alcohol deep into the muscles in several places with an hypodermic syringe. It may be necessary to repeat the treatment in two or three weeks. You better get a veterinarian to do it for you as he will have the instruments and know how to use them.

#### PEPPER LEAVES FOR WORMS

C. S. Russel, a subscriber at San Jacinto writes, "A veterinarian has recommended to me as a remedy for worms in horses all the pepper leaves the horse will eat."

With gasoline in France at \$1.29 per gallon the French masses are turning again to the bicycle for joy rides.

REGISTERED BERKSHIRE BOARS, sons of the \$1500 boar Star Leader, for sale.  
Kounias Registered Stock Farms, Modesto, Cal.

## Guernsey Bull Calves

We are offering a number of bull calves from two to six months old carrying the greatest blood of the Guernsey breed. They are from our best cows—some of which have official records as high as 556 pounds of butter fat at three years, and are sired by the great King of Hollow-Hill 25876 and Cora's Glen 31541—Grand Champion at Riverside in 1916. If you will take them quick you can have them at prices that will surprise you.

### Hollow - Hill Farm

The  
**MONEY-MAKER**  
Owner Says:—  
**"I Can't Afford  
To Take Chances This Year"**

When the forage crops and corn are right for silage, I must be *ready* to cut and fill my silo without delay. A few days wait on the job cutter may mean a big loss—and I must have plenty of good silage to meet high feed prices.

**MONEY-MAKER**  
**SAFE Silage Cutters**

With a Money-Maker Cutter, your silage *don't* need to be too green, too ripe or frosted. You can cut it slowly, and let settle—fill the silo *chock full*. Money-Maker Cutters are up to the standard of Indiana Silos. They cut like a new pair of scissors all the time. The Patented Safety Yoke makes it impossible to get your hands into the cutting rolls. Cushion Drive absorbs shocks of operation—adds long life.

## NATIONAL MILK AND DAIRY FARM EXPOSITION

The greatest gathering of dairymen, farmers and others allied with farm and milk products ever seen in New York City will occur during the week of May 20 when the great National Milk and Dairy Farm Exposition will take place in Grand Central Palace. That the several floors which are to be utilized for the show will be filled with everything of general interest to the public and to those allied with the industry is now assured judging from the large list of concerns that have secured space. All that is new in the equipment line will be shown.

For the observer with a knowledge of the latest that is offered in the dairy and allied lines the products of the exhibitors which will be on view will have a fascination. Never before has the scientific and practical side of the industry been promised such a gigantic display. A great deal of machinery in the Grand Central Palace will be in motion during the show and these displays will be instructive and interesting to everyone. Of course, there will be numerous displays of live cattle, prize stock, and various cattle clubs have secured exhibition space and some interesting live stock displays are in store for the visitors.

Model dairy farms, cows milked by electricity, etc., are also included in the features. Dr. Charles E. North, who is managing director of the show, has arranged a series of contests for which prizes are offered to dealers for the cleanest and best put-up milk; cheese now being made in quantities by American dairymen in varieties that were formerly imported; butter, pot-cheese, condensed milk, ice cream, milk chocolate, evaporated cream, milk powder, etc., etc. In general the exhibition will be 90 per cent educational and designed to teach better efficiency. Special features will be introduced bearing on the following subjects included in the scope of the exposition: agricultural education, dairy farms, cows, country milk shipping stations, railroad transportation, city milk distributing stations, infant milk depots, etc.

Speakers of world-wide reputation will attend the show and many will speak at the various conferences to be held during the week. Among the speakers will be David Franklin Houston, secretary of agriculture of the United States. Governor Whitman of New York will officiate at the opening of the show.

## SWINE BREEDERS' ANNUAL

The annual meeting of the California Swine Breeders' Association will be held at the University Farm, Davis, Thursday and Friday, May 16 and 17.

It is planned to make this the biggest meeting this livestock association has ever held. The program will be particularly strong. Among those who have been asked to address the meeting are: Ralph P. Merritt, food administrator for California, Dean Thos. F. Hunt of the college of agriculture, Professor Gordon H. True, chairman of the live stock commission of California food administration, Dr. Elwood Mead, of the California land settlement board, E. E. Niccolls, representative bureau of markets, United States department of agriculture, Dr. F. M. Hayes of the veterinary division, University of California.

In addition to the above addresses, other subjects of vital importance to the swine industry will be discussed by leading experts.

Every member of the association is urged to attend, and the directors invite every man interested in the business of producing pork whether or not he is a member of the association.—Ralph P. Royce, Secretary.

## MEAT CLUBS

Out in Kansas they are organizing meat clubs. The plan is to get eight or ten families of one neighborhood, all of whom are producers of meat animals, to form a club. Every day or every week one member will slaughter and deliver to other members. Later it is another member's turn, and so on to the end that fresh cuts of meat are available nearly all the time and at reasonable prices.

The first essential for a community meat club is cooperation. The members will know how the animal has been fed and slaughtered and the transportation and middlemen will be

# Cutter's Refined Germ-Free Anti-Hog Cholera Serum

**Produced in the Most  
Up-to-date and Best  
Equipped Anti-Hog  
Cholera Serum Plant  
in the World.**

Does away with the risks that necessarily attend the use of a serum that is not germ-free.

It is 20% more efficient, measure for measure, than the old type, "bloody" serum, is much more quickly absorbed, does not discolor the flesh at point of injection, and carries no liability of producing abscesses.

80 c.c. of Cutter's Refined Germ Free Serum is just as efficient as 100 c.c. of the best old type "bloody" serum.

But we make the old type serum, and do the job so well that though we have sold several million c.c. since we started production in 1917, there has been not even one complaint of failure to protect, or of bad effects following its use.

So, whether you use the old or the new kind, insist on "Cutter's," for in either case you will be getting the best that can possibly be produced.

Remember, a serum may be "clarified," or "clear," and still not be germ free. Such a serum is almost as dangerous as a "bloody" serum. Cutter's Refined Serum is not only clear but it is Germ Free.

Write for our two new booklets, "Hog Cholera Prevention," and "Special and Detailed Information Concerning Hog Cholera Immunization." From the latter you will learn what constitutes good work and why a competent veterinarian should be employed.

## Prices.

Cutter's Refined, Germ-Free, Anti-Hog Cholera Serum is 2½ cents per c.c.

Cutter's Regular, or "old type" Serum, is 1½ cents per c.c.

Cutter's Hog Cholera Virus, for use with either type of serum, is supplied at 1½ cents per c.c. It is dependable.

We prepay shipping charges.

Let your veterinarian order for you and encourage him to be liberal in estimating the amount of serum to use; safety lies in giving more than may be needed rather than trying to figure too fine.

Should he be prejudiced in favor of some other serum, there is a reason that concerns him but not you, except insofar as it should make you more insistent that Cutter's Serum be used. In such case do your own ordering direct from us. You will get "Cutter's" promptly, prepaid.

The Cutter Laboratory, Berkeley, Calif.

(U. S. LICENSED)

"The Laboratory That Knows How"

eliminated. It should be arranged so that the family getting the high priced cuts one time will get a cheaper cut the next time, thus one family will not get more of the better cuts of meat than any other family.

The animals can be furnished by members of the club or purchased from some other source and the cost borne equally by each. Slaughtering should take place as near the center of the community as possible and here all of the equipment should be kept. The members can come to this central point for their meat or they can take turns in delivering it.

## FEDERAL ENCOURAGEMENT FOR HORSE BREEDING

In order to encourage more general production of horses for military service the United States department of agriculture is placing several stallions of proper type in selected locations.

### Plan of Cooperation

The plan consists primarily in placing stallions of merit, registered in the proper stud books and belonging to the Thoroughbred, American Saddle, Standardbred and Morgan breeds in suitable localities in Vermont, New Hampshire, Virginia, West Virginia, Kentucky, and Tennessee. Mare owners may breed to these stallions on the following terms: The owner of the mare agrees in writing at the time of breeding to give the government an option on the resulting colt as a three-year-old at a stated price, which so far has been \$150. No service fee is charged unless the owner of a colt wishes to be released from the option, in which case it is \$25.

### No Money for Fees

This means that practically no money is invested in service fees. If the colt is purchased by the government no fee is charged, nor is there any charge if the colt is offered to the government and purchase refused because it does not qualify. The breeder does not have to pay a service fee on a colt which dies, which is deformed, or which is seriously injured. Only sound mares that approach either a Cavalry or a Light Artillery type are used. Records taken June 30, 1917, show that 3089 colts have been produced since this plan was put in operation at the beginning of the breeding season in 1913.

### Community Breeding Encouraged

The plan has a number of advantages both to the government and farmers, says the publication. The brood mares are usually farm-work animals, which generally pay for their feed by doing farm work, and the colts are brought up to birth without cost. High-class stallions are available for the mare owners' use. Community breeding, which is of inestimable value, is encouraged. The object of the remount-breeding work is to select for and breed sound horses with quality, stamina, and endurance which conform to the army's needs, and such animals will also be useful for general farm work, especially in mountainous sections.

### IN CHARGE OF PORK PRODUCTION WORK

E. Z. Russell of Omaha, Nebraska, regarded as one of the best known authorities in the country in swine husbandry, has been appointed by the United States department of agriculture as a specialist in swine husbandry. On April 1 he took charge of the swine investigations and pork production work of the animal husbandry division of the department, including the work which the division is doing in cooperation with the states relations service to organize pork clubs. Mr. Russell assisted the animal husbandry division last winter in the pork production campaign. He is a breeder of 30 years' experience and has been the manager of the National Swine Show and secretary of the National Swine Growers' Association.

### JERSEY PREMIUMS

The A. J. C. C. premium list for 1918 contains a list of awards to be made at 55 fairs during the coming season of a total of \$11,103. California is particularly interested in two of these awards, that of \$260, California State Fair, August 31-September 8, and of \$140 at the California Liberty Fair, Los Angeles, October 20-26.

## Eight Good Reasons Why You Should Buy a

# DE LAVAL CREAM SEPARATOR

**GREATER CAPACITY:** New capacities have been increased 10%, without increase of speed or effort required in operation.

**SKIMS CLOSER:** The improved bowl design, together with the patented milk distributor, gives greater skimming efficiency.

**EASIER TO WASH:** Simpler bowl construction and discs caulked only on the upper side make the bowl easier to wash.

**EASIER TO TURN:** The low speed of the De Laval bowl, the short crank, its unusually large capacity for the size and weight of the bowl, and its automatic oiling throughout, make it the easiest to turn and least tiring to the operator.

**THE MAJORITY CHOICE:** More De Laval are sold every year than all other makes of separators combined. More than 2,325,000 are in daily use—thousands of them for 15 or 20 years.

**TIME TESTED:** The De Laval was the first cream separator. It has stood the test of time and maintained its original success and leadership for 40 years the world over.

**EQUIPPED WITH SPEED INDICATOR:** Every New De Laval is equipped with a Bell Speed-Indicator, the "Warning Signal" which insures proper speed, full capacity, thorough separation and uniform cream at all times.

**SERVICE WHEN YOU NEED IT:** The world-wide De Laval organization, with agents and representatives ready to serve users in almost every locality where cows are milked, insures the buyer of a De Laval quick and efficient service whenever he needs it.

Order your De Laval now and let it begin saving cream for you right away. Remember that a De Laval may be bought for cash or on such liberal terms as to save its own cost. See the local De Laval agent, or, if you don't know him, write to the nearest De Laval office as below.

At the bottom of your letter to advertisers just say "California Cultivator" and prompt reply is assured.

## Classified Liners

The direct selling method from producer to consumer, and a clearing house for over 31,000 readers, weekly.

Liner rates: Single insertion 3c per word; yearly contracts 2½c per word; 35c per issue minimum charge.

### TREES

**For Sale to Nurserymen or Large Planters**—Owner of a large block of very fine Eureka Lemon trees will sacrifice at a ridiculously low price to those who will take a large quantity. These are not old dirty culled over stock, but strictly first class trees, clean, thrifty and straight, budded high on sour stock, never have been frosted or stunted in any way. Ground has to be vacated by June 1, so this stock will actually be sold at LESS THAN SEEDLINGS CAN BE RAISED. Address X, California Cultivator.

### AVOCADOS

The Spinks is easily the best variety that has fruited in California. It combines the good points of all the others with none of their defects. A rugged, prolific tree and a superb fruit. A large, grown trees of this and other well known varieties, including the Rey, Linda, Sharpless, Fuerte, I. X. L. Caribou and others, \$3.00 to \$5.00 each. Liberal discount in quantities. W. A. Spinks, Duarte, California.

**For Sale**—Extra fine Valencia trees, ½ to 1½, all sour root, high buds, very thrifty, clean and straight, not fertilized, excellent soil for balling, nothing better grown. Can supply a limited acreage yet closing out entire lot of these fine trees. S. R. Coate, 564 S. Los Angeles St., Anaheim, Cal. Phone, Anaheim Pacific 403-J.

**Avocado Trees**, budded, Fuerte variety; a hardy, vigorous grower, bears a rich, delicious fruit. Eighty per cent of all avocado trees planted this year were of the Fuerte variety. Our trees are field grown, straight, symmetrical, with large balls. Send for illustrated, descriptive circular showing prices. WEST INDIA GARDENS, Altadena, California.

**Here is Your Opportunity to Secure A-1 citrus trees.** We offer several thousand 2-year-old lemons; Eureka and Villa Franca, also Washington navel; also several hundred Valencias on sweet root. We call these good trees and we know whereof we speak. ALBERT JACKSON, Upland, California.

**For Sale; Citrus Trees**—Choice stock, young and thrifty. Selected buds, Valencias and Washington Navel, Eureka and Rialto seedless lemon. Marsh seedless grapefruit; also young seedlings. W. W. Burns, 631 Security Bldg., F. 3110, Los Angeles.

**100,000 Sour Orange Seedbed Trees**—50,000 sweet; choice new stock. Trees lined out this year sure to hit high market. Better plant a few thousand next spring. Southland Nurseries, 1941 East Colorado, Pasadena.

**Eureka Lemon Trees**—Closing out some fine three year buds. Very best root system. Very low price for May delivery on these. Any quantity. Smith Citrus Nurseries, 1121 Investment Building, Los Angeles. Main 3604.

**Valencia Orange and Eureka Lemon trees** one year past, ¾ to 1 inch. Pedigreed stock on sour root, high buds. We will bud 6000 choice seedlings to your order. Seed bed stock for sale. Randall Bros. Nurseries, Whittier, Cal.

**For Sale**—About 25,000 uncultured lemons, Navel and Valencias of the very highest character of pedigreed stock must be removed at an early day from present location. Will sell in the field at 10 cents apiece. Apply John Hinkle, Lordsburg, California.

**Closing Out**—15,000 choice Orange and Lemon trees for sale. Marsh seedless grapefruit, Eureka lemons, Washington Navel and Valencias. Two year old buds, 30 cents each or in hundreds lots 25 cents. F. A. Anderson, Elsinore, California.

**By Far the Lowest Priced means of reaching a buyer for what you have to sell is through classified advertisements in California Cultivator.** The cost is only 3 cents per word per issue, with a minimum of 35 cents.

**For Sale**—All Kinds Citrus Nursery stock, 1 and 2 year buds, fine roots. Y. Yamaguchi, Box 574, Phone Sunset 470R, Upland, 10th St. and Cucamonga Ave., Upland.

**Avocado Trees**—Budded; the FUERTE variety is hardest, and bears fruits of the highest quality. Send for new illustrated descriptive circular. WEST INDIA GARDENS, Altadena, California.

The best proposition on the market for the man who wants a farm. For further information address the owners. BROWNELL LAND CO., 904 Third Ave., Seattle, Washington.

**No. 1053—14 Acres**—Price \$1700. Well fenced, good frame dwelling, 2½ stories with stone, in excellent neighborhood, has stable for horses and cows, barn, garage, poultry house and other out-buildings; fruit, 5 miles from County seat, near railroad station. An excellent business proposition and a pleasant country home. Catalogue. Russell Realty Co., Baltimore, Maryland.

**For Sale of Exchange**—60 acres rich, alluvial silt soil. Level. Irrigated, ready for crop. Real alfalfa land. Domestic water on place. Plenty of irrigation water. 1¼ miles from town, churches, grammar and accredited high school. Half cash, half trade, anywhere. Make your proposition now. Chas. McNeely, Alpaugh, California.

**For Sale**—40 acres, 8 miles from Sacramento, on macadamized road. 10 acres alfalfa, 10 acres tokay grapes, 10 acres oats, 150 pears, 50 walnut trees. Family orchard, two pumping plants, barn, 8 room modern house, \$9,000, terms. Owner, R. 2, Box 1570, Sacramento, California.

**For Sale**—18 acres land in Jasmine citrus lands district, Kern County, S.W. cor. Sec. 12. Cheap for cash. F. S. CHAPMAN, Piru, California.

**For Sale or Exchange**—4 acres in city of Santa Cruz, for Los Angeles or Orange County acreage. William Richard, Santa Cruz, Cal.

**For Sale**—40 acres good land close to Exeter, California, \$100 per acre. J. E. Wright, Visalia, California.

### MACHINERY

**FOR SALE—WHY BUY NEW? SAVE YOU HALF MATERIAL GUARANTEED USED PLOWS, CULTIVATORS, DRILLS**—Extension disc cultivator, \$29.50; single disc riding plow, \$47.50; 14-in. Gilpin Deere riding plow, \$32.50; 4-gang Stockton, fine shape, \$27.50; spike harrows, \$16; mowers, \$39.50; rakes, \$25; corn planter, \$22; corn cultivator, \$45; spring tooth harrow; sundries, cheapest in town. BEET DRILLS—Ready to ship \$39 up.

**WINDMILLS**—16-ft. mills for irrigating, \$95; 8, 10, 12-ft. mills. B. & J. deep well turbine pump for 100 ft. well, pumps 50 inches, \$250.

**HOW'S THIS?** 50,000 gal. Redwood tank, lug hogs and 40 ft. tank stand, \$375; 1100 gal. redwood, \$19; 1500 gal. \$22; galv. drums, \$4; 30 gal. hot water boilers, \$3.50; 8000 gal. heavy corrugated galv. tank, \$135; 10,000 gal. heavy corrugated galv. tank, \$175; 9000 gal. heavy riveted steel tank, \$68; wagon tanks, \$28 to \$48; new, used redwood, galv. tanks all sizes. 1200 ft. fine 4-in. O. D. casing, 29½c.

**COMPLETE PUMPING PLANT NEARLY** new 40 hp. West Coast engine and large double acting deep well plunger for 350-ft. well with 9-in. cylinder and 350 feet 11-in. casing cost \$4500, our price \$1950. DEMMITT CO., downtown office, upstairs, 120 N. Main St., Los Angeles.

**REMANUFACTURED PIPE** All sizes, standard pipe, and wrought iron screw casing. All kinds of fittings. Guaranteed good as new. Write for prices.

**WEISSBAUM PIPE WORKS.** 169 Eleventh St., San Francisco.

**For Sale or Exchange**—One 30-60 Hart-Parr tractor; one 6-14 in. bottom tractor plow, good repair, price \$1650. Consider horses, mules, lots or acreage. See machinery at BRILES, 216 N. Los Angeles Street, Los Angeles, or address Box 125, Upland, California.

**For Sale**—One Model S25 Samson Sledge Grip Tractor, used only in plowing and cultivating sixty acres once. \$1400 cash including extensions. Price new, \$1870. A bargain. R. E. Harrington, R. F. D. Box 25, Simi, California.

**Gasoline Engines**, the largest stock of used gas engines in California from 2 h. p. to 100. Thoroughly overhauled. Machinery Exchange, 733 North Spring St., Los Angeles.

### TURKEYS

**The Ferris Bourbon Red Turkeys**, quickly maturing, non-wanderers. Winners at Panama-Pacific, California and Arizona State Fairs, Los Angeles. Eggs \$3.00 per 12. Mating list. The Ferris Ranch, S. Reservoir, Pomona, California.

### POULTRY

**RABBITS, AND THEIR CARE** We are distributing agents for the Western Rabbit Book—one of the best and most authoritative books of its kind published. Tells you how to raise, feed, breed and care for rabbits.

**WESTERN POULTRY BOOK** We are California distributing agents for Mrs. A. Basley's well known Western Poultry Book—a practical book by a practical poultry raiser. Special price, 50 cents.

**GERMAIN SEED AND PLANT CO.** 326-328-330 S. Main St., Los Angeles. Main 996

**Model Poultry Farm**, White Leghorn specialists, established 1903. We are now booking orders for May and June delivery of Baby Chix and Hatching eggs from our bred-to-lay stock. We still have a few 10 weeks old pullets to sell. Our prices are right. W. C. Smith, Prop., Corning, California.

**Baby Chicks**—All good strong youngsters. Hatches every week. White and Brown Leghorns, Rhode Island Reds, Barred Rocks, Black Minorcas, Anconas. Also hatching eggs. Write for circular. J. H. Stubbe, Campbell Poultry Ranch, Campbell, Cal.

**Baby Chicks**, 8-12 week poffets, eggs. Breeders, from 200-283 trapnested layers. Eight popular varieties, clearing \$5.00 yearly. Everything reduced price, May. Limited number. Customers clearing \$59 on 10 hens, \$617 on 110 last year. James Beeson, Pasadena, California.

**Baby Chicks**, Ancona, Rhode Island Reds, \$16.00 per 100. Barred Rocks, \$17.50. MacFarlane Quality White Leghorn, \$12. Many other breeds hatching every week. D. E. Duke, 743 So. Los Angeles St., Los Angeles.

**For Sale**—Lo-Glo, Electric incubators and hovers, absolutely guaranteed. Send for circular. Winning strains Rhode Island Red eggs, \$1.25 for 13. Breeders ready for delivery and orders taken for baby chicks. Greenleaf Bros. & Cushman, 2228 Greenleaf St., Santa Ana, Cal.

**Baby Chicks**—White Leghorn and R. I. Reds. Hatches every week. Any quantity, only first class chicks sent. Write for prices. E. W. Ohlen, Campbell, Cal.

**Book Your Orders for White, Brown or Buff Leghorns, Anconas, Barred or White Plymouth Rocks, Black Minorca chicks with the Stevenson Hatchery.** Watsonville, Cal.

**White Leghorn Baby Chix** from heavy-laying (Hoganized) stock; \$10 per 100. We guarantee safe arrival. The PIONEER HATCHERY, 409 Sixth St., Petaluma, California.

**White Rocks, White Wyandottes, Rocks, Reds, Anconas, Minorcas, White, Brown and Buff Leghorns.** Folder and price list. B. W. Archibald, Soquel, Santa Cruz County, California.

**Chix**—Buff, Brown, and White Leghorns (Barron strain), Anconas, Minorcas, Reds, Orpingtons, Rocks, Silver Campines and breeding cockerels. Enoch Crews, Seabright, Cal.

**Black Orpingtons Lay, Weigh and Pay**—Prize winners at leading shows. Write for mating list. IVEYMOOR FARM, San Leandro, Cal.

**"Eastman's Bred-to-Lay"** Hoganized, trap-nested Barred Plymouth Rocks; chicks and eggs. Fairmead Poultry Farm, Fairmead, California.

**For Sale**—Barred Rock, R. I. Red and White Leghorn chicks. Reduced prices. Fine stock. Madera Hatchery, Madera, Cal.

### LIVE STOCK

**D. E. Kellher**—Importer and Breeder of Hampshire sheep, Eugene, California, offers for sale a choice lot of yearling Hampshire rams sired by Walnut Hall and Butterfield Rams, purchased at Salt Lake, August, 1916, also a few yearling ewes of same breeding. Inspection and correspondence invited.

**Sheep for Sale**—About 1000 head of Black Face and Merino Ewes. A good buy. Address John G. Mee, St. Helena, California.

**For Sale or Exchange for land near coast.** large black registered Jacks and Jennets, good as can be found in California. Address A. L. Allen, Perris, California.

### RABBITS

**Go Into Business for Yourself**—Raise rabbits for meat and fur. Raise stock for us. We buy all you raise. Orders booked now for March delivery. Our booklet mailed for 10 cents. Los Angeles Fur Farm, Dept. C. C., 2669 N. Griffin Ave., Los Angeles.

**Money in Rabbits**—Raise rabbits for us. Will pay \$6.00 per pair. Send stamp for reply. H. E. Gibson Co., Arcadia, California.

**For Sale**—Rabbits. New Zealand and Flemish Giant, young stock. Paul Kruger, Watsonville, California.

### WANTED

**Wanted**—Experienced pruner for citrus trees. Man between 30 and 40. In answering state experience and wages. NATHAN W. BLANCHARD INVESTMENT CO., Santa Paula, California.

**Wanted**—A competent foreman for citrus orchard. Must be capable in the upkeep of pumping machinery. Married man preferred. References required. Address Box 97, Ducor, California.

### GEESE

**Mammoth Geese**—I am booking orders for eggs from my mammoth geese at 25c each. Ship any time. Order all you want. PEA FOWLS—Still have a few pair of young pea fowls at \$10 per pair. Order now, they won't last long. Chas. McNeely, Alhambra, Cal.

### GOATS

**A Bunch of Pure Bred Angora goats** for sale. A bargain if taken soon. 26 full grown females with 20 head of young, at Nadeau ranch, six miles east of Saugus, also fifty to seventy-five head of grade milk goats. R. Nadeau, Saugus, California.

**Toggenburg Milch Goats**—Rae P. Williams, Federal Realty Building, Oakland, Cal.

## HOGS

BERKSHIRES GUERNSEYS

## —GRAPE WILD FARMS—

At present the oldest boars we have to offer are of September and October farrow. They are by Royal Superbus and Fashion Longfellow 27th. We also have a limited number of gilts to offer, bred for May farrow.

**A. H. HUMPHREY,**  
Escalon, San Joaquin County, California.  
**Make Big Money**—Pork prices jumping up. Breeding stock scarce. Next winter will see the greatest shortage of hogs and the highest prices ever known. Prepare now by getting some Whitten Ranch Poland-Chinas—the prolific, easy-feeding money-makers. Prices reasonable; satisfaction guaranteed; everything immune. Send for valuable free booklet, "Hogs for Profit." Ranch in Tulare County, but write R. H. Whitten, 519B Marsh-Strong Building, Los Angeles.

**Poland-Chinas**—Will book a few more orders for May and June delivery, weaning boar pigs out of my best outstanding money making, easy keeping sows, sired by Model Major, first prize winner at Sacramento State Fair 1916 and sire of the 1917 State Fair grand champion or I. B. A. Wonder reserve grand champion at the Panama Pacific International Exposition at San Francisco. Hale I. Marsh, Modesto, California.

**"Billiken"** Chester Whites—The Easy Feeding Mellow Type. All bred sows and bred gilts are gone. Have 15 gilts that were farrowed in May, 1917, that will be bred for September farrows. These gilts are all sired by "Billiken." One young service boar, that is just 13 months old. C. B. Cunningham, Mills, California.

**Registered Poland-Chinas** of the medium type. Three sows to farrow their fourth litters in June and two boars, one two years old sired by Panama Chief. The other 3½ years old. Prices very reasonable. Wm. D. Bear, Chalfant, California.

**Superba, World's Grand Champion** Poland-China boar and one of the greatest sires of the breed. Spring boars ready for service, also few sows bred to this noted sire, reasonably cheap. Rough's Greenfields, Arlington Station, Riverside, Cal.

**We Pay Cash for Hogs of All Sizes,** weights and breeds. Any number from one to several thousand considered. What have you? Durbin & Forbes, 722 San Fernando Building, Broadway 4170, 3030 E. Vernon Ave., South 2712-J, Los Angeles.

**Copre (Made from cocoanuts)**—Best hog-feed. Your dealer, or Lee Chamberlain & Co., Los Angeles, Cal.

**Rancho Rubio Durocs**—Thirty of the finest fall gilts we ever raised. Will begin breeding May 10. Write for prices and pedigrees. Some splendid weaned boar pigs for \$25.00. Elmer Lamb, Ceres, California.

**For Sale**—Four half-blood Duroc-Jersey sows, due to have pigs first of June; 1 registered Berkshire sow with 3 pigs; 1 registered Duroc-Jersey boar; 1 registered Berkshire boar. See E. R. Litten, Blythe, California.

**Mule Foot Hogs**, large type, booking orders for spring litters. These are the farmers' easy feeding, profit producing kind. H. T. Bailey, Box 37, Lodi, California, "The Blue Gums."

**Duroc-Jerseys**—Sold out. Pigs by the Junior Champion and out of winning sows in May. Frederick M. Johnson, Napa, Cal.

**Large Yorkshires**—The ideal hog for the progressive farmer. Service boars and fall pigs, both sexes, for sale. A. L. Tubbs Co., Calistoga, Cal.

**Berkshire** 5 months old boar out of first prize sow. A dandy for \$35. Martin Preston, Route 1, Box 124, Colton California.

**Large Type Poland-Chinas** are prolific and profitable. Can furnish boars any age at reasonable price. J. A. Crawshaw, Hanford, Cal.

**Duroc-Jerseys**—We breed the champions, Peters, Lamson & Walker, Devore, San Bernardino County, California.

**Greenwood Farm Durocs**—"Size with Quality." H. C. Witherow, Palo Cedro, Cal.

**Registered Poland-China Weanling Pigs** for sale. Best stock. C. R. Hanna, Riverside, California.

**HEWITT'S BIG TYPE POLAND-CHINA** gilts and boar pigs. Hewitt & Hewitt, Dixon, Cal.

**Registered Durocs of the big type**—Cholera immune. Derryfield Farm, Odd Fellows Building, Sacramento, Cal.

**Carruthers' Farm Berkshire Hogs**—Our herd won Premier Exhibitor prize at the P. P. I. E. Exposition, Mayfield, Cal.

**Poland-Chinas**—A few good breeding boars. S. F. Williams, Orland, Cal.

## AGRICULTURAL IMPLEMENTS

**IMPLEMENTS AND RANCH SUPPLIES.** Samples and slightly used. Four floors. Large stock. Liberal credit. Save 50 per cent on some. No branches. ARNOTT & COMPANY, INC., The Yellow Front, Established 1892, 112-118 S. Los Angeles St., Los Angeles

## PATENT ATTORNEYS

Patents that protect are secured through The PACIFIC COAST PATENT AGENCY, INC., Savings & Loan Building, Stockton, California; send for our little booklet on "Patents."

Patents—Copyrights, trade marks and labels registered. Solicitor of American and foreign. James R. Townsend, 712 San Fernando Bldg., Los Angeles. Phone: Home A4619; Sunset Main 347.

## LUMBER

**Lumber-Bash-Doors-Plumbing-Supplies**—Building materials of all kinds. New and second hand. A. R. W. shingles 50c per bundle. Send list for estimate. Dan P. (Mission Street) Dolan, 1620-1650 Mission Street, San Francisco.

## The Late-Hatched Chick

Written for California Cultivator By Jean A. Koethen

**S**IDE by side with the injunction "Hatch early," which has been on many lips this season, may be placed the almost equally important one, "Better late than never." Though the early pullet is the one that lays fall eggs, it sometimes happened that she lays too early, while the early cockerel, though he gets the cream of broiler prices if there happens to be any, must be very early indeed to bring it.

It is quite possible that this year the May chick will prove quite as profitable as those of the February hatch. The weather, for one thing, has favored late hatching. Rains were so late that there was no natural growth of green for the early chick, and rape planted after the rain came is only now ready to feed. Kale is hardly ready yet, but early lettuce is up and in fine condition for April chicks. There will be more greens still this month and if we are favored with a light rain or so chicks on range will have good feeding for two months to come. Pullets of the Mediterranean breeds hatched in May should lay in November. Many Orpingtons will do the same, and Reds should be in laying condition by Thanksgiving if hatched early in May.

Cockerels hatched in May are too late to be sold for broilers, but those of the heavy breeds will make fine Thanksgiving roasters. It will cost something to keep them till November, but a six-pound bird at 35 cents a pound is worth \$2.00, while a broiler weighing 1½ pounds at the same price brings only 55 cents. Experts say it costs more to put the third pound on a cockerel than it costs to put on the first two, but the greater abundance of green feed will do something to offset this greater cost. At any rate, unless all the pens are full, a few broods of May chicks are worth trying. They will come very handy for the family table if the earlier fryers have been sent to market.

It is assumed that these later chicks will be hen hatched and hen brooded. Most early chicks must of necessity be incubator hatched and artificially brooded. April sees all the heavy hens anxious to incubate and they can never be better spared than now. In February and January we hesitated to take these hens out of the laying pen. Now eggs are at their cheapest, and hens that sit now will be ready to lay again in June or July when egg prices are beginning to climb. My experience is, that an Orpington or Rhode Island Red hen that is permitted to sit in April and May will lay steadily through the summer and often well along into the fall. It would be a good thing if every yearling hen that goes broody in April could be allowed to raise her family before she lays again. The rest puts these heavy hens that are always inclined to put on too much fat back into good laying form, and lengthens their period of usefulness as layers.

Being brooded by hens and in mild spring weather the May chick has the advantage of being out of doors from the very beginning. It has also the disadvantage of coming into the world during the breeding season of a chick's worst enemy, the little red mite. May chicks and their mothers should be put in clean coops—a new box of proper size is the best home for them—and kept as far from the rest of the flock as possible, in an open field or orchard where earlier chicks have not run. Put the coop in the shade of a tree if possible. If no tree is available, a few rows of corn or a grape vine will furnish satisfactory shade. Keep the hen free from lice, provide clean water, a pan of dry mash and a feeding of grain once a day, and let the chicks hustle for the rest of their living. If there is only plenty of green feed within their reach they will grow like weeds. Late chicks cannot bear confinement as early chicks can. This is partly because close confinement means a bare yard and very often too much sunshine, partly because there are no chilly winds from which they need protection. If kept free from the ravages of lice and mites, and provided with plenty of shade, fresh water and green range, the May chick will often overcome its handicap in age and give

its April brother or sister a good run for supremacy in size if not in maturity. I have seen Orpington pullets hatched in June and raised under such conditions laying in January. May pullets should begin before Christmas.

But the late chick is profitable only when it is kept growing without a single setback. Let its coop just once become infested with mites; forget for a few weeks to dust the mother hen, or, if she is no longer with them, the chicks themselves; keep them in a coop which is so small that they are crowded or so tight that they have not at all times a bountiful supply of fresh air; confine them in small, bare, dirty runs; and you might as well kill them outright and save yourself further trouble.

The ration of the late chick is, of course, important, but it is not so important as that of the early chick, if only free range is given. There are many bugs and worms to be had now. If you doubt it, watch a chick scratching among the heaped-up leaves in the orchard. There is green feed of all kinds. These two items are half the ration. For the other half a hopper of dry mash and one feeding of milo per day is sufficient. My chicks are thriving this spring on a simpler ration than I used to think possible: a little rolled oats and commercial chick feed the first week, then a dry mash of bran and beef scrap, to which before long alfalfa meal is added in the proportion of two parts bran, one part alfalfa meal, one-half part beef scrap. The earlier chicks had corn meal and beef scrap, but they made no more rapid growth than these. They eat milo maize readily after two weeks, and get their share of the bran and potato skin mash which I feed mornings to the layers. As they grow older cocoanut meal replaces part of the expensive beef scrap.

Hens set in April need more care than those set in February. They can cover more eggs, and the eggs are more fertile, but sitting in warm weather is hard on a hen. She must be kept in the coolest place available. There is no better shade for a sitter than that of a large tree. A dust bath of soft, moist earth must always be within reach, and cool drinking water must never be forgotten. Above all things she must be protected from lice and mites. Dust her before she is given the eggs and again after she has grown accustomed to the new nest. Before the eggs begin to pip, dust her again. Watch the nest when she leaves it to eat and dust for signs of vermin. If the box in which she is sitting is clean and she is at some distance from the hen house mites ought not to find her in three weeks. Still, one never knows, and eternal vigilance is the price of chicks. Should a single mite ever be seen crawling on the eggs, an absolutely new nest must be provided. It is a good plan to scatter a little tobacco powder or strong louse powder in the nest litter. Washing the box with kerosene is a sure preventive of mites, but the oil must never come into contact with the eggs or it will kill the germ. Because it is so difficult to use kerosene and be absolutely sure that it will never find its way to an egg I prefer to trust to louse powder and general sanitary conditions. A hen that is never uncomfortable, never worried by vermin, always free to jump off the nest and wallow in soft dirt, with a cool drink and a bite of corn or milo always before her, should hatch every fertile egg and come off a little lighter in weight but otherwise in better shape than when she went on the nest.

## STORRS EGG LAYING CONTEST

Storrs, Conn., April 25, 1918. Report for the twenty-fifth week.

No pen in the contest was quite able to reach the high mark made by a Connecticut pen of Leghorns last week. The agricultural college pen of "Oregons" from Corvallis, Oregon, were in third place with a yield of 54 eggs. The total yield for all pens in the twenty-fifth week was 4082 eggs, a slight increase over the production for the preceding week and a yield of a little over 58 per cent.

Confinement in close quarters the Continued on Page 605

# DR. HESS

## Instant Louse Killer

### Kills Lice on Poultry and Stock

Use it on your lousy hens and chicks—your lousy colts, horses and cattle. You'll get better chicks—bigger, better fowls—more eggs—better contented stock.

Chicks are apt to be lousy now. Give them a chance. Sprinkle Louse Killer into the feathers, about the coops, on roosts, in nests of laying and setting hens. Always keep Louse Killer in the dust bath. For lousy horses and cattle, colts and calves, stroke the hair the wrong way and sift in Louse Killer.

We authorize dealers to return your money if it does not do as claimed.

1 lb. 25c, 2½ lbs. 50c (except in Canada)

Dr. HESS & CLARK  
Ashland, Ohio

## OVER THE TOP

Norwalk casings have no fear of mileage enemies. Full of stamina they dash into the fray, impregnable to practically every attack. Many Norwalks have forged ahead 25,000 miles and more—few have fallen short of the 10,000 mark. Liberty from the bondage of tire trouble is made a reality by using Norwalks. Ask for Price List.

Our true back Chickens from shell to market gives full particulars  
Coulson Co. Petaluma Cal.

Stanislaus County will plant 2500 acres of rice.

## "Lafayette, Here We Are"

Through remote French villages resounds the unaccustomed tramp of American soldiers. But a little while ago and these men were in the quiet of their homes in a peaceful country. Today, in a strange land, they are facing the world's bloodiest struggle.

Pershing at the tomb of America's old time friend months ago reported, with true soldier eloquence, "Lafayette, here we are." And it is for us of the great American democracy to rally all our might to the support of our army and our allies.

From our shores to the battlefields of France are thousands of miles which must be bridged with ceaseless supplies to our troops. Every day calls for action here, no less than there. Cooperate! Sacrifice! These are the watchwords sent over the land by the Government.

In this national effort the Bell System has served with every other essential industry in order that communication, manufacture and transportation may be kept at the peak of efficiency to provide the munitions, ordnance and supplies so urgently needed.

### IN CALIFORNIA

Written for California Cultivator  
By Ida M. Blake

I know a place where sunbeams kiss  
The earth to fairest flower,  
Ah, those sunny hours I would not miss  
In California.

I know a place where bird notes fill  
The air with sweetest song,  
It would your heart with laughter thrill  
In California.

I know a place where mountain lift  
Each rugged peak in air,  
Where nature left her grandest gift,  
In California.

I know a place where life is sweet,  
And earth seems nearer heaven,  
When you and I again shall meet  
In California.

### NEWS FROM JOE

**A** S A middle-aged man came out of the barn at the Seabury place, John Starrett's old horse stopped of its own accord.

"Any news from your boy?" asked Mr. Starrett, after the two men had exchanged greetings.

"Just heard from him," replied Mr. Seabury. "Kind of a relief, too. Fact is, my wife and I have been a good deal disturbed about the draft. We had got quite reconciled to Joe's being with his uncle way off in Tallahassee, because he had such fine prospects and was among relatives. But it was another matter when this war came on. Last night, in particular, my wife and I got to talking it over, and we couldn't see any way out of it but that Joe would have to go. She had a good deal to say about his being a sturdy, hearty fellow, such as the government would delight to get hold of for a soldier; and as for his having any dependents, she and I couldn't anyways fill that bill.

"By bedtime we were all wrought up over it, and could see Joe drafted and over across and in the trenches, and suffering all sorts of things. I couldn't seem to get to sleep any way I could fix it, but just kept turning and tossing.

"After a while Judkins, the mail man, came, and sure enough there was a letter from Joe. We hadn't heard from him for a fortnight. Well, Joe said we needn't worry, for it was all fixed so that the government

couldn't get hold of him. His Uncle Jim—that's my wife's brother—had got him a good job down in Nicaragua; and he was going to start right away, and there he should stay until the war was over."

"Well, well!" said Mr. Starrett, non-committally. Then he added thoughtfully, "Seem's if that doesn't sound just like your boy Joe. Say, there's something queer about this. You say Judkins brought you that letter in the dead of the night?"

"Queer? Of course it was queer," said Mr. Seabury. "Ain't dreams always queer? Didn't you understand that I dreamed it? Well, I did, then, and when I woke up I was all a-drip of sweat. It took me some time to get clear of the feeling that we were all disgraced.

"But that wasn't all of it. First thing this morning my wife had to tell me her experience. She hadn't got any letter, but she had seen Joe himself. He came into the house, looking white and feeble, and says he, 'Well, mother, you needn't fret about my having to go to war. I'm exempt. Doctor says that I'm sick, and won't ever be any better.'

"My wife was terribly down in the mouth. I told her it was only a dream, but that didn't pacify her; and finally I had to fall back on the old saying that dreams always go by contraries.

"Sure enough, ours did. This forenoon Judkins did leave a letter from Joe. He had enlisted, and he's as sound as a nut. He's cheerful and hopeful, and wants us to be. And we are going to try. Of course there is risk, although they say that it doesn't figure out to be nearly so great as you would think. For that matter, a chap is in some danger wherever he is, as long as he is alive at all. Anyway, I'd risk having my boy over in France doing his duty sooner than I would having him down in Nicaragua, or any other place, shirking it."

"Well," said Mr. Starrett deliberately, "looking at it from all sides, I don't see as I can do less than kind of congratulate you."

Then the old white horse, feeling perhaps that enough had been said, started on of its own accord.—Youth's Companion.

### YEAST BREADS WITH HALF WHEAT FLOUR

Any recipe given below will make an 18 to 19 ounce loaf.

#### Method

Make a sponge of the liquid, syrup, yeast, mashed potato and enough of the ground oats to make a batter. Allow to rise until light (about one hour) and then add the salt, fat and remainder of the oats and the flour. These doughs must be much stiffer than ordinary bread dough.

Knead thoroughly and allow to rise until double in bulk. Knead, mold into a loaf, and when double in bulk, bake 50 minutes to one hour. Begin in a hot oven (400 degrees Fahrenheit or 205 degrees Centigrade). After 15 to 20 minutes, lower the temperature to that of a moderate oven (390 degrees Fahrenheit or 200 degrees Centigrade) and finish baking.

#### Ground Rolled Oat Bread

Fifty per cent wheat flour, 38 per cent ground rolled oats, 12 per cent potato (1:4 basis).

One-half cup liquid, one tablespoon syrup, one teaspoon fat, one-half cake compressed yeast, one teaspoon salt, one and one-half cups (six ounces) wheat flour, one cup (4 ounces) ground oats, three-fourths cup (six ounces) mashed potato.

#### Cornmeal Bread

Fifty per cent wheat flour, 38 per cent cornmeal, 12 per cent potato.

One-half cup liquid, one tablespoon syrup, one teaspoon fat, one-half cake compressed yeast, one teaspoon salt, one and three-fourths cups (seven ounces) wheat flour, one cup (five ounces) cornmeal, three-fourths cup (six ounces) mashed potato.

#### Rice Flour Bread

Fifty per cent wheat flour, 38 per cent rice flour, 12 per cent potato.

One-half cup liquid, one tablespoon syrup, one teaspoon fat, one-half cake compressed yeast, one teaspoon salt, one and one-half cups (six ounces) wheat flour, one cup (4 ounces) rice flour, three-fourths cup (six ounces) mashed potato.

#### Buckwheat Bread

Fifty per cent wheat flour, 38 per cent buckwheat, 12 per cent potato.

One-half cup liquid, one tablespoon syrup, one teaspoon fat, one-half cake compressed yeast, one teaspoon salt, one and three-fourths cups (seven ounces) wheat flour, one cup (five ounces) buckwheat, three-fourths cup (six ounces) mashed potato.

#### Barley Bread

Fifty per cent wheat flour, 38 per cent barley flour, 12 per cent potato.

One-half cup liquid, one tablespoon syrup, one teaspoon fat, one-half cake compressed yeast, one teaspoon salt, one and one-half cups (six ounces) wheat flour, one and two-thirds cups (4 1/2 ounces) barley, three-fourths cup (six ounces) mashed potato.

#### Corn Flour Bread

Fifty per cent wheat flour, 38 per

## FORD OWNERS

**The Aske Auto-  
 matic Voltage  
 Regulator, \$5.00**  
 With Dimmer .....\$6.00  
 If you have a Ford car,  
 write today for information  
 telling just how you can  
 have bright lights at all  
 speeds. The Aske is the only patented  
 device guaranteed to continue the operation  
 of one light without increased voltage  
 should one light burn out.

**The Aske Instrument Board**  
 complete with clock, dimmer and push and  
 pull switches, which are standard with  
 higher priced cars, decreases steering  
 wheel vibration, eliminates all starting  
 and lighting troubles, adds beauty and  
 distinction to your car and gives a won-  
 derfully efficient system. The Instrument  
 Board complete with Regulator and Dim-  
 mer \$18.00, without regulator \$13.00, with-  
 out regulator and clock \$10.00. The In-  
 strument Board without equipment \$1.25.  
 The Aske Dual Lighting Units are sold at  
 most dealers, or will be sent direct to you  
 upon receipt of price and dealer's name.

**Aske Voltage Regulator Co.**  
 Duluth, Minn.

 ASHLAND PUMP AND HAY TOOL WORKS

## THE SELF-OILING WINDMILL

has become so popular in its first three years that  
 thousands have been called for to replace, on their  
 old towers, other makes of mills, and to replace, at  
 small cost, the gearing of the earlier  
 Aermotors, making them self-oil-  
 ing. Its enclosed motor  
 keeps in the oil and  
 keeps out dust and  
 rain. The Splash Oiling  
 System constantly  
 floods every bearing with oil pre-  
 venting wear and enabling the  
 mill to pump in the lightest breeze.  
 The oil supply is renewed once a year.  
 Double Gears are used, each carrying half the load.  
 We make Gasoline Engines, Pumps, Tanks,  
 Water Supply Goods and Steel Frame Saws.

At the bottom of your letter to advertisers just say  
 "California Cultivator" and prompt reply is assured.

cent corn flour, 12 per cent potato.

One-half cup liquid, one tablespoon  
 syrup, one teaspoon fat, one-half cake  
 compressed yeast, one teaspoon salt,  
 one and two-thirds cups (6 3/4 ounces)  
 wheat flour, one and one-fourth cups  
 (4 1/4 ounces) corn flour, three-fourths  
 cup (six ounces) mashed potato.

If dry yeast is used make the  
 sponge with one-eighth to one-fourth  
 cake and allow it to rise over night.  
 If liquid yeast is preferred, substitute  
 one-fourth cup for one-half cake of the  
 compressed yeast and reduce the  
 liquid in recipe to one-fourth cup.

## HOW TO PREVENT SPOILAGE OF FLOUR IN HOT WEATHER

To prevent the losses from spoilage  
 in certain flours and meals during hot  
 weather, the United States food ad-  
 ministration has issued instructions  
 regarding their storage. In view of  
 the importance of breadstuffs to our-  
 selves and the allies at this time, it  
 is essential to reduce to a minimum  
 such losses as may occur through  
 careless handling and storage.

### Keep Cool and Dry

Flours and meals should be stored  
 in cool, dry, well ventilated places;  
 warehouses should be whitewashed  
 and swept clean before these products  
 are placed in them; large supplies  
 should not be accumulated. If too  
 large a stock is on hand, it should be  
 reduced and the flours and meals con-  
 sumed as soon as possible.

Care should be taken in storing  
 bags of flours and meals to have suf-  
 ficient space between the tiers to allow  
 abundant ventilation, and to raise the  
 bags sufficiently from the floor to ex-  
 clude rats, mice and insects; also to  
 permit cleaning of the floors without  
 the necessity of transferring the prod-  
 ucts from one part of the warehouse  
 to another.

Special care should be taken of the  
 following products: Bran, shorts and  
 middlings, corn products containing  
 the outer coating and germ, such as  
 so-called water-ground cornmeal and  
 grits, etc., oats and oat meal, graham  
 and whole-wheat flours, rye flour,  
 barley flour, peanut meal, soya bean  
 meal. These products should be kept  
 moving or be used as soon as prac-  
 ticable and should not be allowed to  
 accumulate in warehouses.

Care should also be taken of pota-  
 toes, as they will begin to sprout in  
 warm weather. If they do sprout, the  
 tender shoots should be rubbed off  
 and the clean potato transferred to  
 new containers, all rotting potatoes to  
 be removed at the same time.

## MAKING THE ARMY CAMP HOME- LIKE

Farm boys of America enlisted in  
 the National Army are sharing in  
 great numbers in the advantages so  
 generously provided for them through  
 contributions made by the farmers of  
 the country in the recent Y. M. C. A.  
 war fund campaign. No small per-  
 centage of the fund, which has now  
 reached \$60,000,000, was contributed  
 by farmers of this country, which was  
 expressive of their desire to provide  
 their boys with some of the comforts  
 and conveniences of home.

No matter where the farm boy or  
 the city boy goes as a soldier, he is  
 greeted by the Y. M. C. A. or Red Tri-  
 angle. It is his club; he finds com-  
 forts there such as he was used to at  
 home. There is a phonograph, a piano,  
 plenty of writing paper, books, maga-  
 zines and newspapers, as well as  
 wholesome vaudeville or home talent  
 entertainments, boxing and wrestling  
 matches and various other recrea-  
 tional and athletic games.

When his day's drill is over the  
 American soldier has a place where  
 he can go and find rest and amuse-  
 ment or a congenial companion or  
 write a letter to mother.

Announcement has just been made  
 that the Y. M. C. A. has been put in  
 charge of a great recreation center  
 in the French Alps for the exclusive  
 use of the American troops on leave,  
 which indicates how completely the  
 soldier boys' welfare is being looked  
 after while he is away from home.

Fifteen million dollars are being  
 spent by this organization among the  
 enlisted men now in training here,  
 and a similar amount is going into the  
 same type of work for those abroad.  
 All of which means that the boys who  
 are to save the world for democracy  
 are not going to lack the comforts  
 and advantages of home even though  
 they are 3000 miles across the sea.

## "Refreshments will be served"

IT makes little difference whether  
 it's a dance, a school or church  
 social, a Red Cross Chapter meeting,  
 a "get-together" meeting of the  
 Farm Bureau or a big rally—

Chances are Ghirardelli's will be  
 "among those present." And—for  
 very good reason:

It promotes sociability. It provides  
 added cheer and comfort. It is a  
 delicious, refreshing food-beverage  
 that is always in order at *any* social  
 function.

In 1/2 lb., 1 lb. and 3 lb. cans; a  
 tablespoonful—one cent's worth—  
 makes a cup.

## U.C. Farm Expert says—

**"Wood blocks make a very desirable floor"**

Professor J. B. Davidson of the University of California, College of Agriculture, says:

"Wood blocks make a very desirable floor when well laid, either of durable wood or a treated wood, especially for that part of the floor upon which the animal is required to stand. The use of wood blocks obviates to a certain extent the use of a liberal amount of bedding where the animal must lie on the floor."

## California Redwood

*Resists rot and fire*

Redwood block paving is *especially* desirable—contains a *natural* preservative. No creosote or artificial preservative is necessary to increase Redwood's durability. Redwood block paving resists wet and dry rot, is permanent in shape and will last a life-time.

Redwood block paving is *not expensive*.

Write for free booklets, "Redwood Block Paving" and "California Redwood on the Farm."

Small Whites .....14.00  
Blackeyes .....10.00  
Tepary .....10.00@11.00  
Lentils .....25.00

### HAY

Considerable interest has been manifested in the hay market, and it was feared a material decline might take place. It is holding its own, however, excepting alfalfa which is shaded \$1.00 this week. The local rains of Wednesday will materially improve grain but have little effect on hay.

Quotations by Nichols-Loomis Company. Prices to growers f. o. b. L. A. carlots:  
Tame Oats .....26.80@28.00  
Volunteer Oat .....14.00@16.00  
Wheat .....23.00@26.00  
Barley .....23.00@26.00  
Alfalfa .....18.00@20.00

Quotations furnished by California Alfalfa Growers' Association, Riverside, California.

Number 1 alfalfa hay is \$23.00 per ton f. o. b.; common shipping points take a \$1.50 carload rate to destination. Prices from points where a higher or lower rate applies to destination will be correspondingly lower or higher.

### GRAIN AND FEEDSTUFFS

With new barley harvesting on in the Imperial it is probable prices on all grains may be established soon but as yet only chaos obtains and only individual barter can determine price of the feeds or grains.

## San Francisco Markets

San Francisco, May 7, 1918.

### BUTTER

The quotations on butter are on the basis of solid packed cubes. To ascertain the market price of butter in squares, add to the cubes basis price per pound, as follows:

Two-pound squares, parchment wrapper, ½c; 1-pound squares, parchment wrapped, 1c; 2-pound squares, in cartons, 1½c to 2½c; 1-pound squares, in cartons, 2c to 3c.

Dairy Exchange quotations, lb.:  
Extras .....40½  
Prices on butter are practically 15 cents above year ago this date.

Prices Extras past week and year ago:  
April 30May 1 2 3 4 5

Wholesale selling price.  
Artichokes, doz. ....12½@40

**BALFOUR, GUTHRIE & CO., LAND DEPT., 350 California St., San Francisco**

## FARM LABOR

By R. L. Adams

Concluded from last week.

Growers of Santa Clara County are asking for several hundred boys to be drawn from the Oakland school system to help in the fruit harvests of San Jose and vicinity.

At a meeting in Santa Barbara officials of the Woman's Land Army of America made the statement that they had orders for 1500 women to be placed in Southern California, mostly in canneries and fruit work.

These little snapshots of efforts to meet the situation locally or with our own people are taken at random from many similar attempts.

The Valley Fruit Growers' Association of Fresno represents an enterprise conducted by the farmers to bring in several thousand people whom it is expected will be largely drawn from Southern California.

The California and Colorado Agricultural Labor Association is a private enterprise of the six Southern California sugar companies operating

jointly with two Colorado concerns. Their task will include importation of Mexicans for the benefit of their growers.

It is impossible to predict how far these different organizations will meet the situation. That every man, woman and child who can help should do so is a foregone conclusion and only the results of the season will indicate which of the two opinions advanced above is correctly taken.

That the community which is forehanded in meeting its needs will suffer the least handicap is a point well worth bearing in mind, for unless the supply is greater than we have reason to believe, the available sources will not be great enough to go around.

Certain state and federal organizations are already arranging to carry on constructive lines of work in connection with the coming needs for farm labor. These organizations should be given full opportunity for proving their worth in meeting the situation. The quickest way to demonstrate the need for additional help is to call and keep calling continuous-

ly upon the employment offices, especially those which represent the state and federal jurisdiction so that if unable to supply sufficient help from within our borders the need will be more clearly recognized and means undertaken for meeting the shortage.

## The Federal and State Employment Services

California has long had two public organizations connected with employment work. One of these, under direction of John P. McLaughlin, state commissioner of labor, has offices in five cities, San Francisco, Oakland, Sacramento, Fresno and a cooperative office at Los Angeles; the other, under federal jurisdiction in connection with the immigration service, has maintained offices at San Francisco, Sacramento, Fresno, Los Angeles, San Diego, San Luis Obispo, Santa Barbara, Bakersfield and Calexico.

In February W. T. Boyce was appointed director of employment for California, Arizona and Nevada for the United States department of labor. Following his appointment a co-

operative arrangement was perfected between the federal offices and the state offices. An appropriation of \$15,000 by the state, to be met with an appropriation of an equal amount from the federal government, is now available, and these organizations working together are now financially well equipped to work out a plan for better utilization of available and potential supplies of farm labor.

The matter of actually drawing upon all potential supplies and placing this labor upon ranches will be handled by the cooperative arrangements of the state and federal offices as outlined above. The plan contemplates an extension of offices in localities not at present served, elimination of duplicate offices, the providing of qualified men to select ranch help for shipment, and the inclusion of the clearing house feature. The completed plans provide for main offices at Alturas, Redding, Eureka, San Francisco, Marysville, Sacramento, Stockton, San Jose, Fresno, Modesto, Bakersfield, Santa Maria, Los Angeles, San Diego and El Centro. Numerous sub-offices are also planned.

From our work of 1917 it is apparent that much can be done to render more efficient the labor already available. Through an intelligent understanding in advance of coming need for men or release of men greater efficiency will obtain. It is to accomplish such results that we look to this cooperative employment service.

California Industrial Welfare Commission

This state department, in charge of Mrs. Katherine Phillips Edson, is well

Markets on

equipped to undertake the mobilization of women, supervise the conditions of and their possible employment in agriculture.

The Woman's Land Army of America with offices at 468 Chamber of Commerce, Los Angeles, is also working to mobilize women for purposes of placing them in ranch work.

## State Board of Education

Acting through the commissioner of secondary education, Will C. Wood, machinery is available for mobilizing the school children in upper and high school grades and to determine the number available for use in farm labor. Responsibility for placing the youngsters rests with the state farm labor agent, working both independently and through the farm advisers, while the matter of supervision is being undertaken by the Y. M. C. A. for boys from 16 to 21 and by the Boy Scout Masters for the boys under 16.

## United States Boys' Working Reserve

The United States Boys' Working Reserve is an organization of the United States department of labor. The state leader is Prof. B. H. Crocheron of the University of California. This organization is prepared to enroll boys from 16 to 21 for farm work. To avoid duplication of effort its work will be handled in connection with the work of the state board of education as outlined above.

## State Farm Labor Agent

Following the outbreak of the war in April of last year, the United States department of labor, concerned with labor in general, relegated to the United States department of agriculture all problems connected with the farm labor supply. Within the United States department of agriculture, this matter was referred directly to the office of farm management concerned primarily in gathering information concerning the exact status of affairs, with the added general responsibility of bringing all organizations into a working unit, thus avoiding surplus of help and duplication of effort.

To bring about an organization which would meet the situation as nearly as it could be foretold, the United States department of agriculture divided the country into four districts putting a man in charge of each district; California falling into the so-called Western Division made up of 11 states. In each of these states a man was then appointed, with the title farm help specialist, to be respon-

# The Balls don't care

whether the weight is on the top or either side—no difference at what angle the machine is running. The balls are round, they take the thrust from any direction. **THRUST**—(Dictionary) to push with sudden impulse from any direction, shove with more or less force; to force ahead; to push; to drive; to press; to urge; to impel; to attack; to crush.

The balls are held in place by the rigid steel frame and the shoe below. For side-hill work the Yuba Ball Tread Tractor is the most serviceable.

Ball-bearing machinery is the nearest approach to frictionless mechanism—and it is friction that wastes power.

As the tractor glides more easily over the rolling balls, the plows sink deeper; the acreage increases; the cost decreases—that means money saved for you.

Model 40-70

sible for the investigations and actual supply of help so far as he was able.

The work of the department for California was vested in my office. The office had already been charged by the University of California, acting for the state council of defense, with the handling of state farm labor matters. This cooperation thus early resulted in one agency being held responsible for the work of all these organizations. At the present time the office, being as it is in close touch with 36 farm advisers in as many of the 58 counties of the state, is well suited to gather information concerning needs and supplies and to actually furnish labor in certain special instances.

In conclusion it is too early to accurately predict the outcome for the season, but too much emphasis cannot be placed upon the desirability of recognizing conditions as they are and making plans to go just as far as possible in squarely facing the issue and arranging to use every facility at hand to lighten the farmers problem in so far as at least as it concerns ranch labor.

#### DURUM WHEAT

The publications of the department of agriculture are divided into two general classes, those of a practical nature for the reading of the general farmer, and the other, "professional papers." One of the latter class is Bulletin 618, "Experiments with Durum Wheat," by Carlton R. Ball and Allen J. Clark. As noted, this is a professional paper, but the wheat

100 Per Cent Patriotic

Two sons in the army, a member of the Red Cross, and, while past heavy manual labor age, fingers are busy knitting for the soldiers. This is a photograph of L. H. Garnire of Imperial Valley.

producer who may want a valuable fund of information as to durum, which has been grown for seven years near Chico and for three or four years near Modesto, will find much of value in this bulletin. It may be had by sending ten cents to Superintendent of Documents, Government Printing Office, Washington, D. C.

Extensive experiments with durum wheats have been conducted in this country for the last ten to 15 years. During this period their commercial importance has increased steadily. At first they were regarded commercially with indifference, then with hostility, then with approval. Numerous bulletins have discussed their introduction and adaptation and also their value under more or less limited conditions. The purpose of the present bulletin is to assemble the principal accumulated experimental data on yields of durum wheat in the United States, including history, statistics of production, characters and relationships of the important varieties and results of experiments conducted at 20 field stations.

To prevent boots from creaking and cracking rub the soles with linseed oil or place them in a plate full of oil. The treatment also makes them waterproof.

It is better to eat a corn dodger than to be one.

#### SABOTAGE ACT

A weapon which should be effective is now in the hands of federal officials in the act which gives power to punish the willful injury or destruction of war material or of war premises or utilities used in connection with war material, and for other purposes" (popularly known as the sabotage bill), approved April 20, 1918, and is the most important and sweeping of all war statutes relating to hostile or anti-war activities.

It includes every possible kind of supplies of a nature which could be used by the United States government or any of the Allies in the prosecution of the war. It includes not only the finished articles, but all parts and ingredients. As almost everything which is being grown or made today is either for the use of the United States or the Allies or suitable for such use, this bill practically protects articles and supplies of every character, the whole product of agriculture and industry in the United States. Whoever willfully destroys or injures or makes in a defective manner or

causes to be made in a defective manner any of such supplies, materials, parts, or ingredients can be punished under this act.

#### 100 PER CENT PATRIOTIC

One of the features of the recent liberty loan drive has been the "100 Per Cent Patriotic" card displayed by institutions, every member of which has subscribed for a liberty bond. Josephine County, Oregon, proposes to be considered 100 per cent patriotic in the matter of labor. She has resolved, "That the citizens of this community will not tolerate nor countenance any slackers, loafers or shirkers among its able bodied population and will do its best to see that hobos and beggars are abated; that local residents be fully employed; that boys and girls be encouraged in endeavor and thrift and that any person not giving his best endeavors in some useful capacity be dealt with by a special committee who shall take such action as may be deemed advisable by the circumstances."

Some concern was manifested in this state because of reported cotton seed shipments from a boll weevil infested section of Texas. The report arrived that the shipment had been made without any knowledge of the point to which they were consigned. The watchfulness of California inspectors has located both these shipments. Commissioner Hecke reports that one was caught at Whittier, Los Angeles County, and the other at Coachella, Riverside County. Presumably both have been destroyed and the cotton growers breathe easier.

George A. Laminman, horticultural commissioner of Shasta County writes:

We are killing ground squirrels by the thousands up here and are going to help win the war.

If we're going to get the kaiser,

Kill a squirrel,

If we're going to feed the army,

Kill a squirrel.

We're not working for a bounty

But we're freeing Shasta County,

From the squirrel.

## The Tractor for all the World

PLOWS THE GROUND

PREPARES THE SOIL

PLANTS THE CROPS

REAPS THE HARVEST

**A**LL year 'round utility characterizes the Cleveland Tractor. It performs its varied duties regularly, season by season. It is a "man-of-all-work."

It plows. It harrows. It plants. It reaps.

And it does all of these things *faster* and *better* than was possible before.

But that isn't all. It does the thousand and one other things that require mechanical power. It pulls your manure spreader. It runs your saw. It operates your pump. It cuts your ensilage. It drags logs and lumber. It pulls road machinery. It does practically everything! that horsepower and stationary engines can do. It develops 12 horsepower at the drawbar for hauling and gives 20 horsepower at the pulley for stationary work.

The Cleveland Tractor plows  $3\frac{1}{2}$  miles an hour—eight to ten acres a day—which is equal to the work of *three* good men with *three* 3-horse teams.

*It travels on its own endless tracks which it lays down and picks up as it goes along.*

It operates easily over gullies, ruts, and uneven ground of all kinds. Because of its 600 square inches of traction surface it goes over sand, gumbo, mud and slippery clay without packing the soil, without sinking, miring or floundering.

The Cleveland weighs less than 3200 pounds and is so small that it can be readily driven under and among small fruit trees.

It steers by the power of its own engine and will turn in a twelve foot circle.

It requires less space to house than a single horse.

The Cleveland Tractor was designed by Rollin H. White, the well known motor truck engineer—and is manufactured under his supervision.

He has designed the track for long service. The sections are constructed to prevent filling or packing with mud and protection is provided to prevent dirt and mud from falling into the track. The sections are joined with hardened steel pins which have their bearings in hardened steel bushings.

Gears are protected by dust-proof, dirt-proof cases and are of the same high quality as those used in the finest trucks. Materials used throughout are of the best.

Every step must be taken this year that will speed up farm work—that will enable machinery to replace muscle—that will help produce—and increase harvests.

The Cleveland Tractor is already bearing a big share of the war burden. Farmers are producing larger crops because of the Cleveland—and *are making greater profits.*

You too can help the nation meet the food emergency—and incidentally make more money for yourself. Write to us *now* for complete information and the name of the nearest Cleveland dealer.

## THE GIANT FARM POWDERS

STUMPING — AGRICULTURAL

"Better Farming" is all that the name implies. It tells you how to do a hundred and one farm jobs cheaper, quicker, easier and better.

This pocket farm library is published by a company with more than a half a century of experience in making explosives especially to meet western agricultural conditions. You should know the low cost and thorough methods by which they have cleared western land and boosted yields of crops and fruits. Whether you blast or not, you need these 52 pages, fully illustrated, of modern, improved farm methods.

"Better Farming" is sent you free of charge, post-paid. For the price of a postage stamp you get something it has cost us thousands of dollars to prepare. Merely fill in and mail this coupon, or send postal mentioning this paper. Write now.

## All Fuels Look Alike to

## High Tension MAGNETOS

Whether you burn gasoline, kerosene, distillate, solar oil or spirits, there is a K-W Magneto that will fire *leaner mixtures* and *cheaper grades* of fuel and still develop *full horsepower* than you could get through any other system of ignition.

K-W Magnetos effect this saving because they give the hottest spark known—timed accurately. In addition—they start your engine easily—without troublesome batteries or self starters. Their construction protects them against *water, dirt and oil.*

K-W Magnetos are standard equipment on 83 models of tractors, built by forty of the leading manufacturers. See that your new tractor be K-W equipped. If you're not using a K-W on your present tractor, equip *now* with a K-W. There is a type that will cut your fuel bills, and give no trouble ignition. Write for details today and a list of K-W equipped tractors.

## The Moline Grain Binder

The Best Work Under the Worst Conditions

THE Moline Binder has a record of over 50 years of good, honest service wherever grain is grown. In difficult work, in continuous running without stops or breakdowns—in short, in an emergency, Moline superiority is apparent.

The Moline Grain Binder is built from the ground up of the best materials by skilled workmen and has been gradually developed and improved until it is as near perfection as possible. It is built to do the best work even under the worst conditions. That's why a Moline Binder user is never satisfied with anything else.

When you buy a Moline Grain Binder you get the benefit of 50 years' service, the lightest draft, the greatest stability, the strongest construction and the greatest reliability in a grain binder—you get crop insurance.

A typical instance of Moline performance under unusual conditions is reported by Jerry Rivard of Bourbonnais, Ill., as follows:

The Moline 8-ft. Binder bought of you I used in cutting 110 acres of grain. I cut seven acres of new ground where I did not think it could do the work, being very trashy ground, and the men present insisted I was doing wrong to try to cut it with a binder, but the Moline Binder went through cutting all. I never missed a bundle and never broke anything. I consider this remarkable, considering the condition under which the test was made.

We have many letters such as this on file, all equally enthusiastic over the work of the Moline Binder.

The frame of the Moline Binder is extra strong, making it particularly good for tractor use.

See your Moline Dealer about the Moline Binder now, or write us for full information.

**YOU**—“*The Man with the Plow*”—may look far afield, your thoughts may be of the boys in the trenches, you may even feel a strange tugging at the elbow, but your task just now is to plow and plant and produce. *Your* fight is in the “supporting line.” And from that line must come the strength of the

## AMERICAN + RED CROSS

—the great organization of mercy, whose activities  
know no bound in territory, no limit in service.

The atrocities of our enemies have made war's suffering doubly great, but that suffering is being relieved by the Red Cross. In Belgium, in France, in Serbia, in Armenia—wherever war has spread its misery, the Red Cross is at work: nursing the sick

and wounded, feeding and clothing the destitute, rebuilding devastated lands—even preparing crippled soldiers for new lives of the greatest usefulness and independence. And for this great work your money is needed.

Your Red Cross is an all American, largely volunteer, organization, authorized by Congress, headed by President Wilson, audited by the War Department, enthusiastically approved by your Army, your Navy, and your Allies.

The work covers both military and civilian relief in every war torn Allied country and full reports of all expenditures are continually being published, or are available through the Chapters.

Every cent of every dollar received for the Red Cross War Fund is spent for war relief. All administration costs and relief work for other than war purposes (such as the Halifax and Guatemala disasters) are taken care of out of membership dues, and the interest which accrues from the banking of the War Fund has made actually available for war relief at least one dollar and two cents for every dollar contributed.

## Bureau of Markets Comes to Our Help

A Great Terminal and Market Place Established in Los Angeles and at Same Time the Federal Department of Agriculture Recognizes Needs of Coast in Establishing Many Branches Which Render Service to Producers. Headquarters at Los Angeles Terminal.

**T**HE producer of garden or truck farm crops or even of a small quantity of fruits which are to be marketed in the fresh state finds his problem is not ended when he has produced his crop. He takes his wares to market and, until he has learned the ropes, his confusion after his first look in at the babel

buildings now constructed or under construction is over 4000 feet. The frontage of the market buildings alone aggregates 2800 feet. The frontage of the two six story buildings aggregates 1200 feet. There is trackage sufficient in the market to permit of the unloading and loading of 100 cars daily.

Besides the stalls and markets there are 100 offices located in the buildings. Other features which make

Since the days of the Civil War better cultural practices have been encouraged, but only within the past few years has the bureau of markets been in existence, and only within a few days has this bureau established on the Pacific Coast branches which issue daily reports giving exact conditions of the markets, not only locally but in all parts of the United States.

These branches are now installed at Los Angeles, San Francisco, Portland, Seattle and some of the cities of the Mountain states. These are all under the direction of O. W. Schleussner. Mr. Schleussner's office is Room 204 Union Terminal Building.

Regarding the principal features of this market reporting service the bureau has issued the following statement:

The daily reports show the carlot shipments of important fruits and vegetables for the entire United States; a statement of the f. o. b. prices and daily carlot receipts in the important consuming markets and the jobbing prices prevailing from day to day.

The reports are issued daily during the heavy shipping season of any one commodity, and cover all important perishable food commodities including apples, cantaloupes, grapes, onions, peaches, white potatoes, sweet potatoes, tomatoes, watermelons, celery, and dry beans.

The information given as to carlot shipments and arrivals is obtained from the railroads. The price information is compiled by salaried representatives of this bureau stationed in

miles of private leased wires which are operated by the Bureau of Markets between practically all of the important receiving markets in the United States have now been placed at the disposal of the fruit and vegetable growers and shippers.

Each one of the branch offices is in charge of a trained produce man who thoroughly understands the business and whose duty it is to cover the market each morning and report the arrivals, quality and condition and extent of demand for all seasonable perishable products which are arriving on the market in carloads. This man is on the ground early in the morning while actual sales are being made and reports conditions from personal observation.

The information, gathered in this way, is telegraphed to central headquarters at Washington where it is tabulated and redistributed by private leased wire to all sections of the country from which commercial quantities of the various perishable crops are moving. It is mimeographed by the various branch offices of the bureau located in these producing areas and is distributed by mail free of charge to all interested growers and shippers. By noon each day the Los Angeles office will have ready for distribution the information concerning the conditions prevailing in the central markets at 9 o'clock that morning.

In addition to this information from the market centers, the bureau receives reports from the divisions superintendent on every railroad in the United States moving fruits and vege-

Workers in the Bureau of Markets

The gentleman at the reader's right is O. W. Schleussner in charge of Pacific branches of the bureau of markets, United States department of agriculture. Mr. Schleussner is located at the Los Angeles Union Terminal. The gentleman with hand in pocket is H. H. Warner in charge of the Los Angeles branch.

of hucksters and producers is more than confounded when he endeavors to get next to the man who will turn him over hard cash for his year of labor. He finds a market with all who are connected with it in apparent accord as to how they shall treat him. He stands alone and is entirely helpless. Those with whom he has to deal may be entirely honest, but their system of dealing and their methods are so strange to the producer that he seldom gets justice. At least this is the feeling which obtains with the vast majority of producers of perishable crops.

But few producers understand the magnitude of the business in these crops in our larger centers. On the cover of this issue appears a photograph which gives only a faint idea of one corner in this great industry in the city of Los Angeles. It shows wherein almost unlimited capital has been used by some of the brainiest of business men, and in a true cooperative spirit, to bring together forces which make for economical and expeditious handling of these products and turning them over to consumers at lowest possible cost.

The picture on the cover gives a morning scene in the five acre "court" of the Los Angeles Union Terminal Company. This company has invested five millions in land and reinforced concrete buildings. It has purchased 20 acres near the heart of Los Angeles, ten acres of which are already occupied by this five acre market and the concrete buildings surrounding it. The frontage of these

for almost a complete little city in this great center are a produce exchange, a bank, the Inside Inn, three restaurants, two telegraph offices, cold storage plant, one of the best equipped and up-to-date of any in the United States, Standard oil station, California Walnut Growers' Association, United States Bureau of Markets, and 50 wholesale produce firms doing a business which will total at present rate over \$20,000,000 annually, and it is predicted that before another year rolls around it will total \$40,000,000. The vice-president and general manager of this great institution is Gerald Fitzgerald.

Construction work on this terminal began only a short time before America's entrance into the war in 1917, and it may be some years before it is entirely completed, but its formal dedication took place on Saturday, May 11.

The laudable cooperative spirit which has made this great institution possible and which will make for cheaper foods to the consumers is the same as that manifested by cooperative fruit growers, live stock breeders and others of the producing class who recognize that marketing is a business and unite in securing some one qualified to handle that business. We believe California leads the country in cooperation.

A material aid both to producer and to consumer is now to be given by the department of agriculture. We say it is now to be given, for in the matter of marketing the department of agriculture is only recently in the field.

Preparing the Trackage

One hundred cars of produce may be received and as many forwarded daily from this great terminal.

the principal markets and shipping areas of the country.

A report of the cold storage holdings of the most important food products in the entire United States is issued semi-monthly. This report shows the total holdings in cold storage, the percentages of decrease or increase, and a comparison of the total figures with those of the corresponding period of the previous year.

All of this information is distributed free of charge. The five thousand

tables in carlot quantities, giving them a complete record of all shipments during the previous 24 hours. This information is also handled telegraphically and appears on the market bulletins, thus giving the shipper complete knowledge of supplies moving to market.

In addition to the furnishing of the market information described, these branches of the bureau are also authorized to receive orders for produce. Continued on Page 615

## For Cultivating Beets or Beans

Use a Moline Beet Cultivator No. 6

WITH a Moline Beet Cultivator No. 6 you cultivate beets or beans two, three or four rows at a time, doing thorough work and covering a great amount of ground with little effort. The cultivator is easily handled, instantly responsive to the driver's control, and provided with a variety of adjustments that make it perfectly adapted for work under any conditions and in any kind of soil.

It is controlled entirely by pushing forward upon foot levers that pivot the wheels and guide the tool bar simultaneously. The tool bar is swung from the main frame so that it is free instantly to move in either direction. The combination of wheel and tool bar control gives the most responsive and flexible control system yet devised.

making it possible to cultivate four rows at a time in a thorough manner without injury to the plants.

The ease with which the machine is handled is due in a large measure to its construction, which is almost entirely of steel, giving maximum strength with minimum weight. Draft is light, the connecting bars between the tool bar and the main frame being directly in the line of draft, subjecting the tool bar to maximum pull.

Two levers are used for raising or lowering the tool bar, operating either together or independently. Two levers are provided as at times it is necessary to force one end of tool bar deeper than the other.

Your Moline Dealer will be glad to show you this cultivator. See him or write us for full information.

## Soil Nitrogen and Nutrition of Citrus Plants

G. McBETH, physiologist of the United States bureau of plant industry, writes in the Journal of Agricultural Research on the "Relation of the Transformation and Distribution of Soil Nitrogen to the Nutrition of Citrus Plants." From a summary of this paper in the International Review of Agriculture we give the following:

The total nitrogen content of Californian citrus lands is often low, and the quantity rendered assimilable through the natural processes of nitrification soon becomes inadequate to the needs of the plants unless it is maintained by the addition of commercial fertilizers, cover crops, manure, etc. On the other hand, the low rainfall of the districts in which citrus is grown, and the furrow system of irrigation practiced, cause an uneven distribution of the nitrates in the soil, so that the solution of the nitrogen problem depends, not only on a knowledge of the factors influencing nitrification, but also on a knowledge of the forces controlling the distribution of nitrogen in the soil.

In order to solve these problems the author carried out at the citrus experiment station grove at Riverside a series of fertilizer and irrigation experiments with various quantities of ammoniacal and nitric nitrogen. He came to the following conclusions:

### Fertilizer

**Dried blood:** Semi-arid soils often fail to nitrify dried blood when added in one per cent quantities, but invariably nitrify it when it is applied in quantities not exceeding those used ordinarily under field conditions. In the first case it often produces large accumulations of ammonia which do not occur in the second. Semi-arid soils to which has been added one per cent of dried blood may lose, during a six weeks' incubation period, 50 per cent of the nitrogen added. As they frequently give off a strong ammoniacal smell, this loss is probably largely due to the volatilization of the ammonia. Ammonification or nitrification studies on semi-arid soils to which one per cent of dried blood is added are of doubtful value and may lead to erroneous conclusions.

**Green manures:** These, especially the legume varieties, nitrify very rapidly; half of the nitrogen contained in the green plant tissues may be converted into nitrates in 30 days. They also form a valuable source of energy for the non-symbiotic nitrogen-fixing organisms.

### Effect of Furrow Irrigation

The furrow system of irrigation often causes very unsatisfactory distribution of the soil nitrates. In many citrus groves more than two-thirds of the nitric nitrogen in the top four feet of soil are found in the surface six inches, in which, owing to the frequent cultivation, few feeding roots are found. This system also frequently causes the formation of nitre spots, where, if the soil is heavily fertilized, as much as one per cent of nitrogen as nitrates may be found by surface scrapings. These spots, or salt crusts, attributed by Hildgard to rapid nitrification of the organic matter of the soil, by Headden to the fixation of atmospheric nitrogen by nonsymbiotic bacteria, and by Stewart and Peterson to the leaching of nitrates already in the soil, are, according to the author, rather to be attributed to the movement of water in the soil. Their characteristic brown color depends on many factors of which the most important appears to be the deliquescent character of the calcium nitrate.

When the furrow system of irrigation is used the fertilizer should be plowed down somewhat deeper than the land is cultivated, thus placing the food within reach of the feeding roots, because in the cultivated zone the irrigation tends to carry it away from these roots.

Much nitric nitrogen is lost from citrus lands by leaching. The most effective way of preventing this loss is by growing a winter cover crop.

Basin irrigation or overhead irrigation give a more satisfactory distribution of soil nitrates than the furrow system. The first seems to give better results when combined with a mulching system. However, the rapidity with which materials rich in nitrogen decay would seem to make it inadvisable to maintain a constant mulch with these materials, as the nitrates produced would probably be much in excess of the needs of the tree, and much loss would result.

### Mottled Leaf

This disease is usually more marked in plots treated with large applications of commercial nitrogenous fertilizers, and is frequently (but not always) associated with a high nitric nitrogen content of the surface soil, a content which may be due to unfavorable conditions of the soil. An extremely variable supply of plant food and soil moisture may be an important factor in mottling. Mottled leaves usually have a higher moisture and nitrogen content than healthy leaves.

## California Avocado Association Meets

Avocado growers are holding their sixth semi-annual meeting at the Chamber of Commerce in Los Angeles Friday and Saturday of this week. The following is the program:

Afternoon session at 2 o'clock, Friday, May 17: Annual business meeting for members, to include election of three new directors, the adoption of a new constitution, the election of honorary members, and such other business as may come before the meeting.

Evening session, 8 o'clock, May 17: Illustrated lecture, by Dr. H. J. Weber, on "New Avocados, and Avocado Experimental Work."

Forenoon session, 9:30 o'clock, May 18: How Far Can We Go With the Avocado as a Food? Lester Keller, Yorba Linda; The Door Yard Avocado, Ernest Brauntun, Los Angeles; When Is an Avocado Ripe? Mrs. B. H. Sharpless, Tustin; Advertising the Avocado, Mrs. Margaret Stewart, Los Angeles and DeWitt H. Gray, Fresno; Chemical Composition of the Avocado, C. G. Church, Bureau of Chemistry, Department of Agriculture, Washington.

Afternoon session, 2 o'clock, May 18: Why Are the Guatemalan Avocados Best? E. E. Knight, Yorba Linda; My Experiences With the People: The Avocado Psychologically Considered, Dr. W. Earl Flynn, Monrovia; This Association, Thos. H. Shedden, Monrovia; How Do the Cit-

rus Growers View the Avocado? C. E. Needham, Glendora; What Constitutes a Good Avocado? H. M. Halderman, Los Angeles; Care of the Young Avocado Tree for a Year After It Leaves the Nursery, Wm. Hertrich, Alhambra; Question Box.

### CONTROL OF ARGENTINE ANT

The United States department of agriculture is mailing free Farmers' Bulletin 928, "Control of the Argentine Ant in Orange Groves." It refers to the introduction of this pest on ships at the port of New Orleans at least 25 years ago and to its seriousness as a pest in houses, groceries, and orchards. It is also a pest of field and truck crops. One of the most important considerations is that the Argentine ant favors increased infestation by scale insects. Methods of trapping, poisoning, and general control measures are given. This bulletin may be had free by writing Division of Publications, Washington, D. C.

### SHIFTING EXIGENCIES

"What do you understand by Socialism?"

"My ideas on the subject are not clear. As near as I can get it a Socialist is a man who is willing to try almost any kind of a government once."

More than 42,000,000 spark plugs were thrown away last year, largely due to the breakage of inferior insulators

## 42,000,000 spark plugs junked in 1917

*This enormous waste, largely due to the breakage of inferior insulators, rendered needless by a new artificial stone*

**E**VERY motorist knows the constant trouble he has with faulty spark plugs.

This trouble is largely due to the use of inferior material in the insulators. They are frail and simply can not stand up under modern engine conditions. No one should expect them to.

Inferior insulators crack and break down quickly. They cannot withstand the intense heat of the present-day engine—2000° to 3000°F.; the sudden temperature changes; high speeds; and rapidly recurring hammer-like blows of compression. They short-circuit, miss fire and are thrown away.

### The development of Vitrystone

After eight years of experimentation in the Red Head potteries, spark plug experts perfected an insulating material that would not crack under the most severe engine conditions.

Practical tests prove this discovery to be the greatest advance made in spark plug construction in the past ten years.

Vitrystone—the new insulator—is an artificial stone. Its rugged, crystalline structure is unaffected by rapid changes from extreme heat to extreme cold. It withstands the most intense vibration.

The difference between inferior insulators and Vitrystone under the heat of the engine is the difference between a porcelain-ware dish and a stone-ware dish. If you suddenly pour cold liquid into a hot porcelain-ware dish, the chances are it will crack, but you can subject a stone-ware dish to the same test without damaging it.

### Built for years of service

Red Head spark plugs are built for years of service. Rigid tests insure gas-tightness and insulator efficiency. If a Red Head misses, clean it and nine times out of ten it will fire 100% right. It is easy to clean.

Don't wait till your spark plugs crack and miss fire. Put a full set of Red Head plugs in your engine today. You will find that they stand up perfectly under the most severe working conditions.

There is a Red Head plug for every requirement.

Your dealer has Red Head plugs in stock or can get them for you. If he does not, write to us for the name of the nearest dealer who can supply you.

# Best buy your SEED CORN NOW

The supply of all kinds of seed corn is decreasing every day. Some varieties are almost sold out. Others soon will be. Prices will not be any lower and for some varieties an increase seems certain. By all means buy your seed now.

¶ This year you are sure of high prices for Indian Corn and—you will get a good crop if you plant Morse's Stanford Yellow Dent or Morse's Hybrid Yellow Flint.

¶ Stanford Yellow Dent Corn was originally produced on the famous Vina Ranch. It is acclimated to California and under proper cultural conditions is a sure crop in the interior valleys of California. Last year it first was offered to the public. Scores of satisfied customers have written us their endorsements.

¶ Morse's Hybrid Yellow Flint yields heavy crops of fine, well filled ears. There is no corn better adapted for California. It will soon be time to plant forage and grain sorghums.

¶ Morse's Dwarf White Milo and Fererita are two varieties that cannot be beat. Morse's Egyptian Corn is another good producer. All seed acclimated and re-cleaned.

¶ New Honey Sorghum is being planted extensively by farmers who want to make their own syrup.

## Save Your Walnut and Citrus Crop by Using a Hardie Sprayer The Higher Cost of Paying Less

You don't buy a Sprayer simply for the sake of owning it. It is not the possession that appeals to you. It is the service the sprayer gives you. We could do things at less cost, but what would we have gained? A cheap sprayer never satisfies. It gives trouble, requires repairs, fails when you need it most, and wears out quickly.

### Hardie Quality is Like Paying Less

Saving money is the same as making money. Therefore every Hardie sprayer pays dividends to you through its lower upkeep cost and its greater durability. High Pressure, Light Weight, Large Capacity, Powerful Engine, Perfect Agitation, Simple Construction, and the wonderful retank filler, and many other valuable features described in the big spray catalog which will be sent on request.

### Hardie Orchard Gun, \$12.00

The HARDIE ORCHARD GUN that is revolutionizing spraying methods does the work quicker and easier than ever before. This device shoots an enveloping spray, carrying the spray to the high walnut tree tops. GUARANTEED satisfaction or your money back.

WE KNOW THAT "BLACK LEAF 40" IS FATAL TO APHIS.

## Fruit Standardization

Shippers Try to Put One Over but Reckon Without Billy Wood

TATE Horticultural Commissioner Hecke is giving out the following from a report made by County Horticultural Commissioner Wood of Los Angeles. It has to do with the standardization of strawberry packs and is one of the indications that our standardization laws will mean better reputation and better money for our fruit growers.

In another place may be seen the state commissioner's appeal for enforcement of standardization.

Commissioner Wood writes:

The strawberry crop here is very light this season and the price has been exceptionally high, so much so that many growers could not resist putting in anything in the shape of a berry that would help fill the boxes. In fact they had carried this to such an extent that complaints of consumers came into the office. I immediately took the matter up with the field inspectors and visited the berry fields where the picking was going on. I soon found that the complaints were justified. I also found that nearly all of the Japanese had formed an association so strong that they had complete control of the berry market and that anyone who wanted berries must take them as they came or leave them; in fact, dealers who made complaints requested me not to use their names because the "Japs" held the whip-hand and would boycott whoever made complaint against them.

On the 16th of this April I met the president and directors of the Japanese association and told them what they would have to do to comply with the law and showed them how they were hurting themselves by forcing such inferior berries on the market, and that I would be compelled to hold up all of the berries offered for sale and prosecute the owners, where the packing did not comply with the law.

After making this statement to the directors, I was assured by them that they appreciated what had been told them; that they were glad of the explanation and that they would notify every grower how the berries must be packed and that there would be no more cause for complaint, etc.

On the 17th and 18th on making an inspection of the berries throughout our markets, I found a decided improvement, and every berry dealer I visited praised our office for the great improvement made in so short a time. The inspected berries in our markets brought from two and one-half cents to five cents more per box than those not inspected.

On the 18th I went out with one of my inspectors to Gardena and Moneta where six cars were being loaded for eastern shipment and upon examination I found many of the berries in four of the cars would have been a disgrace to California if allowed to go east; so I told the growers they could either sort them over and pack them properly, or sell them to the canneries. They succeeded in doing the latter the second day after being held up, at five cents per box, or five cents less than the dealers were to have paid.

In justice to the association directors, I must say that they have tried to have the growers comply with the law. They did not do so and consequently had to lose an item of \$9270. This was much better than prosecuting a single case where the court might have fined the grower only a few dollars. I feel confident that this lesson will be a lasting one and cause the berry growers to take notice when warned by inspectors that the law must be obeyed.

In commenting upon this case Commissioner Hecke says: "Mr. Wood should be commended for the diplomacy and tact with which he has handled this very difficult situation. By no other means could it have been possible to bring home to the strawberry growers the need of complying with the state regulations in regard to this pack. It also furnishes an excellent example of the fact that the success or failure of a law lies largely in the way it is applied. Here Mr. Wood, without bringing a single case into court, has forced the strawberry growers to accept the state regulations and has apparently incurred no

enmity, in fact it would seem that the growers have been brought to realize the justice of the ordinances and the benefits which may be anticipated therefrom."

\*\*\*

Horticultural Commissioner Hecke, writing of the problems before county commissioners today says:

These are busy times for everyone. The county horticultural commissioners have a distinct service to perform and much is expected of them. Squirrel control, insect and disease control, weed control, inspection of nursery stock and plants, are all important and must not be neglected. In addition to these duties another important duty was added by the legislature of 1915, (the law being amended by the legislature of 1917), and that duty is the enforcement of the fresh fruit standardization law.

It is expected that the coming season will witness a decided shortage of cars for transporting our fruit crop to the markets. This makes it more necessary than ever before that every attention be given to standardizing the pack of our fruits. Nothing except the best fruit which conforms absolutely to the requirements of the standardization law should be packed, and inferior fruit of all kinds should be utilized in the manufacture of by-products.

Many of the county horticultural commissioners have been very active in the enforcement of the fresh fruit standardization law since its passage. Others have not yet begun this work but are no doubt intending to do so this season. The office of the state commissioner of horticulture is preparing a special form for taking notes on violations of the law; in the near future these forms will be mailed to the commissioners with the request that all violations detected be reported to this office. While the enforcement of the act is entrusted to the county horticultural commissioners, the state commissioner of horticulture and his chief deputy are ex-officio inspectors-in-chief of fresh fruits, and as such it is their duty to see to it that uniformity in the work is brought about throughout the state. Therefore, it is very important that each commissioner plan now to enforce the fresh fruit standardization law and it is also very important that we know of any violations of the law and are kept accurately informed throughout the packing season, regarding the progress of the work. The field deputies will be available for service in the various counties of the state, and whenever possible these officials will aid the county officials in the solution of their problems.

The standardization movement is one of the biggest movements in connection with the fruit business and

now is the time to plan for definite work in connection with the enforcement of the new act.

CROP REPORTS

J. F. Benton, Horticultural Commissioner, Humboldt County

Apricots damaged by frost, peaches light, cherries good, prunes fair.

N. E. Mathews, Santa Ana, Orange County

Apricots: Little or nothing on old trees. Young trees loaded but in the aggregate making much lighter crop than last year.

Fred P. Rouland, Horticultural Commissioner, Fresno County

Things have been so uncertain regarding crop production that I have hesitated to make a report. However, I am certain that we will not have a crop of peaches like that of last year. I believe peaches will be somewhere between a 65 and 75 per cent crop.

All other fruit in the county is looking immensely well at this time of the year. Grapes are setting well and everything points to a favorable crop.

A. L. Shively, Santa Paula, Ventura County

Apricots show about 60 per cent of normal crop. Young orchards generally will have good crop; some old trees scarcely anything.

Sheridan W. Baker, Santa Rosa, Sonoma County

Prunes, 75 per cent.

LOOKING OUT FOR BOLL WEEVIL

County Horticultural Commissioner Sharp of Riverside is making an active campaign against quarantine violators. Here is report of action on cotton seed importation taken from daily press:

Charging that George Cooper of Ontario is guilty of violating the California quarantine laws concerning the importation of cotton seed, Commissioner Sharp has caused a warrant to be issued for his arrest and announces that he will be prosecuted to the full extent of the law.

Cooper is specifically charged with failure to send to the state quarantine guardian in Riverside County a statement of the contents of a seed shipment and the name of the locality where it was grown.

Some weeks ago at Blythe, Mr. Sharp alleges that he seized a shipment of cotton seed sent from Ontario by George Cooper to J. D. Cooper. When examined, the seed was found to contain boll weevil and was ordered burned.

So flagrant a case resulted in a careful investigation, and the warrant for Mr. Cooper's arrest is the result.

BUREAU OF MARKETS

Continued from Page 611

authorized to make inspections and issue certificates as to the true condition of carloads of produce arriving on the market. These certificates are issued only at the request of the shippers or shippers' agent and are accepted in all courts as prima facie evidence as to the true condition in any cases where there is any dispute regarding this.

The local work of the Los Angeles office is in charge of H. H. Warner, while that at San Francisco is in charge of S. H. Boddington, whose office is in the Consular Building, San Francisco.

As may be noted on last market page of this issue, these offices are anxious to mail these daily market reports to everyone interested. At the present moment special reports are being issued on onions, and every large onion producer should secure these daily reports. A weekly report, giving more general review of the market, is issued every Tuesday afternoon.

Spray Now for the Melon Aphis

Due probably to the fact that it was not checked by cold weather during the past mild winter, the melon aphis has shown unusual activity this spring, and threatens to do considerable damage unless controlled. Although the aphis can be found on a number of trees and plants, the greatest damage will be to melons and cucumbers. These plants are all small now, many just coming up, and an infestation of the aphis at this time is likely to kill the plants outright. Although it may be possible that natural enemies and weather conditions will greatly reduce the number of aphis, it is extremely hazardous to wait and take such a chance. In order to be on the safe side, spraying should be resorted to immediately.

The following formula has been tested and is recommended by the department:

Nicotine sulphate, 40 per cent, six fluid ounces; whale oil or common laundry soap, two pounds; water, 50 gallons.

The tobacco solution (nicotine sulphate) should not be mixed with the soap until both have been somewhat diluted.

The aphis feed almost entirely on the under side of the leaves. Therefore an angle spray giving a fine mist spray should be used. The above insecticide kills by contact, hence spraying should be thorough enough to come in contact with every aphid, otherwise they will not be killed.

As the melon aphis will feed on many other plants and weeds, it is essential to the success of controlling this pest that all weeds in the melon field be cut before spraying and kept down afterward. Every weed makes

an additional breeding place for the aphids to spread to the melons or cucumbers. Weeds around the sides of the field should also be removed.

As there are now many winged aphids being produced, some of these may migrate to the melons after the latter have been sprayed, making it necessary to spray again a second or third time. The plants should be carefully watched to ascertain if this is necessary.

Any additional information can be gained by addressing the Truck Crop Insect Laboratory, 800 North Marguerita Ave., Alhambra.

PLANNING LARGE

The premium list of the 1918 Southern California Fair at Riverside, October 8-12, has just come from the press. A copy may be had by addressing Secretary R. L. Taber, Riverside. Premiums in all departments have been increased this year, especially in classes for livestock.

The superintendents of livestock will be: Horses, mules, F. L. Hall, Perris; cattle, sheep, Geo. W. Thomas, Alvord; swine, F. A. Langdon, Perris; goats, J. A. Packard, Riverside; poultry, E. I. Hammond, Riverside.

One strong feature of the live stock department will be the first annual Southern California Duroc-Jersey Futurity under the direction of the National Duroc-Jersey Record Association.

Better service is assured by the advertiser if when writing you mention the California Cultivator.

## The Soy Bean

THE soy bean is an erect, rather hairy, leguminous plant, resembling somewhat in its early growth the ordinary field or navy bean. It is a native of southeastern Asia and is grown extensively in China and Japan, being used for human food, for forage, and as a green manure. The high yield of seed, the nutritious forage, the ease of growing and harvesting, and the freedom from insect enemies and plant diseases should encourage the planting of this crop. One of its most common uses is for hay, which is comparable to alfalfa and red clover in feeding value. It is also valuable as a soiling crop, yielding from five to ten tons of green forage to the acre. Good results have been obtained where soy beans and corn are mixed as ensilage. The soy bean can be used to advantage for green manure, greatly increasing the supply of humus and nitrogen of the soil. For a greater variety and larger yield of forage it may be satisfactorily grown in combination with other crops, such as cowpeas, sorghum, corn, and Sudan grass. The use of the seed or meal as a substitute for cottonseed or oil meal in the feeding ration has given excellent results. Under ordinary conditions the best varieties yield from 20 to 30 bushels of seed to the acre. As a human food the soy bean may be used as a green vegetable (when the seed is about full grown), while the dried beans may be roasted as a substitute for coffee, in soups, or baked, and as flour or meal, the same as corn meal. In addition to their forage and food value, soy beans contain a valuable vegetable oil utilized in many trades. The cake remaining after the oil is expressed is a valuable food for all kinds of live stock.

The soil requirements are quite similar to those of corn. Rabbits are exceedingly fond of the young plants and sometimes cause serious injury where the plot is small, especially in the semi-arid regions.

### Inoculation

Soy beans, like other legumes, when well inoculated add much nitrogen to

the soil. In isolated localities where this crop has not been previously grown, some difficulty from lack of inoculation may be expected. The inoculation of a new field may be most certainly secured by applying soil from an old soy bean field, using from 300 to 500 pounds of soil to the acre or dusting the seed with some of this soil.

### Culture

The land should be thoroughly prepared before seeding. If the soil is low in fertility, phosphoric acid and potash should be applied to obtain the best results. Soy beans may be sown at any time after danger of severe frosts is over, ranging from early spring until midsummer. The general practice for seed production is planting in rows, 30 to 48 inches apart. For hay, soiling, or green manure, a drilled or broadcasted crop furnishes a finer quality of forage. In rows, from 20 to 30 pounds of seed to the acre are found satisfactory, and if broadcast or drilled, 60 to 90 pounds. The ordinary grain drill may be used in planting by covering the feed cups not in use, thus spacing the rows as desired. The cotton planter or corn planter may also be used. For small areas the ordinary garden drill does well. The planting should be shallow, not exceeding two inches in depth. As soon as the seedling plants appear above the ground cultivation should begin. Soy beans should receive at least three cultivations.

### Harvesting

The time of harvesting depends on the use to be made of the crop. Soy beans are best fitted for hay when the pods are well formed. When grown for grain alone, the cutting may be delayed in the case of most varieties until all of the leaves have fallen. The early varieties can best be harvested with a mowing machine or bean harvester. The later and taller growing varieties can be harvested satisfactorily with a self-rake reaper, a mowing machine, or a self binder, the last being the best for rather tall varieties.

## Rodent Control

California is going after the varmints. The state horticultural commission announces appointment of five field men who will conduct the fight in the five districts into which the state has been temporarily divided for battle operations. These field men will work with the county commissioners in their districts. They are: A. E. Gray of District No. 1 with headquarters in Forum Building, Sacramento; C. Olsen, District No. 2, Redding; Harley Ean, District No. 3, Santa Rosa; L. S. Neville, District No. 4, Visalia; A. H. Call, District No. 5, 324 Union League Building, Los Angeles.

The work of these men will be: Control of rodents on state lands, particularly the ground squirrel at this time, and the help and assistance

which they are to give the county horticultural commissioners. In conducting operations on state lands, local conditions will necessarily determine the methods to adopt. Crews will be organized, with suitable camps, (sanitation and other factors considered, mode of travel, distribution of poison, etc., being planned in advance of actual operation.

In helping the county horticultural commissioners, these men will attend meetings, those specially called by the horticultural commissioners, the farm bureaus or any other organizations assisting or desiring to assist in rodent control. They will assist in demonstrating the mixing and distribution of poisoned grain, will aid the individual rancher and above all will show no partiality to localities, men or commissioners.

## Farm-Wage Rates in 1917

Definite information concerning the great increase in the wages of farm labor last year has been provided by the United States department of agriculture in a recent publication. Wage rates per month in hiring by the month or season with board in 1917 ranged from \$21.88 in the South Central states to \$36.23 in the North Central states west of the Mississippi River and \$44.25 in the Western and Pacific, with a national average of \$28.87. Without board, the monthly rate for the United States was \$40.43, with a range from \$30.80 in the South Atlantic states to \$49.46 in the West North Central and \$63.59 in the Western and Pacific. Harvest wages with board were as high as \$2.77 per day in the West North Central states and as low as \$1.55 in the South Atlantic, while the United States average was \$2.08. The rates without board were 35 to 59 cents higher in the various sections.

Outside of harvest, day rates of wages with board ranged from \$1.17 in the South Atlantic states to \$1.91 in the North Atlantic and \$2.03 in the West North Central, and the United States average was \$1.56. Without board, the rates were 35 to 95 cents higher.

As a general average for the whole country, the increase in the rate of wages per month with board in 1917 over 1916 was 24.2 per cent. The increase over 1910 was 50.3 per cent. In the average rate of wages for harvest labor with board, the increase in 1917 over 1916 was 23.1 per cent; without board, 22.7 per cent. For day labor outside of harvest, farmers paid 23.8 per cent more with board and 24.7 per cent more without board. The general fact is that the rates of wages for farm labor increased almost one-quarter in one year and about two-fifths to one-half in seven years.

## Reduce Friction

Friction wastes distillate, oil, steel and time.

Reduce friction and save the power. That's the aim of the engineers who build the Yuba Ball Tread Tractor. The secret is in the Balls on which the machine glides—glides so smoothly and easily.

Study the Ball Tread.

# Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

## Pasturing or Cutting Alfalfa for Hogs

What is your opinion of the system of feeding hogs green alfalfa, cut daily, in their pens, instead of turning them out on the field? (Hog fencing is expensive, and hog's rings either do no good in wet ground after irrigating, or come off, thus the hogs ruin an alfalfa field in a short time.) — Subscriber, Coaldale, Nevada.

Certainly one can secure much greater return from the land by cutting and feeding the alfalfa. It is a case where one has to consider land prices and present labor prices. We will be glad to hear from hog feeders as to which method has been found the most economical.

## Thornless Blackberry

In a recent issue in this department the question was asked as to the success of the Thornless blackberry in interior and warmer valleys. A Tuolumne County subscriber, J. E. Meier, writes: "They will thrive in a hot climate. The berry originated near this place and I firmly believe it will do well under the most trying conditions." Mr. Cory, the producer of these vines, exhibited at the time of the tractor demonstration at Davis specimens showing immense growth, and he gives assurance that they will do exceptionally well under conditions such as exist in interior valleys.

## Dwarf Pears

Can you give me any data on the dwarf pear? What can it do under the best conditions and what will it yield per acre?—Subscriber, San Bernardino.

This question was referred to A. L. Wisker of Grass Valley who answers: Under the best of conditions dwarf pears will stand blight no better than standard pears, the difference in the two being wholly in the root. The dwarf pear is grown on quince root, which is far more susceptible to blight than the Japan pear seedling root now so generally used upon which to propagate standard pears. In point of comparative yield per acre, under the best of conditions standard pears will produce double the tonnage of fruit that would be produced on the dwarf trees. Some orchardists contend that the quality of some pears is improved when grown on dwarf roots, but the usual commercial varieties of high quality are probably not perceptibly improved when grown as dwarfs. It is doubtful if dwarf pears are justified under California conditions, unless it be for small home orchards or where soil conditions are unfavorable for trees propagated on pear roots. In extremely heavy soils with poor drainage, the dwarf root would sometimes be preferable.

## Testing Acid Soil

I have read with interest the article in your issue of the 13th on Lime and Gypsum. In testing soil from some spots that bother me the blue litmus remains blue and the red turns purple. One sample from spot that bakes and grows nothing turned completely dark purple, the other from spot with sandy subsoil only partly purple. Is this alkali? If so I suppose gypsum would be indicated for neutralizing.—Subscriber, Porterville.

The bluing of litmus paper may be due to black alkali, magnesium carbonate or calcium carbonate (lime), but

the difference may be determined in the following manner: After moistening three slips of red litmus paper place them in the moist soil a little apart and press the soil close to them. Examine one at one minute, at four minutes and at 20 minutes respectively. If there is no bluing at one minute no black alkali is present; if none at four minutes no magnesium carbonate is present; and if none in 20 minutes no lime carbonate is present. In the last named case supply a ton of finely ground lime carbonate or air-slaked lime per acre; if either black alkali or magnesium carbonate is present apply at least a ton of gypsum per acre. Upon the spot where nothing will grow apply gypsum at the more liberal rate of four tons per acre.—R. R. S.

## Fruit Fast

What is a fruit fast?—Subscriber, Rosamond.

As contradictory as it may seem, a fruit fast is abstaining from all foods

excepting fruits. This type of fast should be popular with California fruit growers.

## Bauhinia Purpurea

Send leaf and flower, the leaf having the peculiar habit of folding or closing at night, some leaves even remaining tightly closed all day. The flower is purple.—Subscriber, Los Angeles.

This is one of the leguminosae, Bauhinia purpurea. The name was given in honor of John and Caspar Bauhin because of the twin leaves suggesting two brothers. It is sometimes called mountain mahogany or orchid tree. It is a native of India and Southern China. The tree is small or medium size and gives a profusion of bloom at this season.

## BIG FAIRS THIS FALL

The favorable outlook for a successful 1918 California State Fair is made the basis in part for the statement issued by General Manager John C. Simpson of the Eastern States Exposition, Springfield, Massachusetts, that "altogether the big fairs and expositions of the country are alive to the possibilities before them this year."

"From coast to coast the feeling prevails that the coming fall will see

enough of an adjustment of railroad congestion to permit the satisfactory moving about of exhibits," says Simpson in a letter to Secretary Charles W. Paine of the California State Board of Agriculture.

"They are all, without exception, looking forward to a great realization of their purpose since fairs began, and they are all striving to render to the government the assistance they are so peculiarly fitted to give."

On Western fairs the report says: "Fairs in this section are bending every effort toward war work. Preparations are going ahead with greater interest than ever. No uneasiness over unusual conditions admitted."

## PUT BOND INTEREST INTO STAMPS

Don't take interest money from your government at this critical time if you can possibly avoid it. If the government owes you money, put it right back into other government securities.

Liberty loan interest will be due in May. It is not likely that you need this interest to live on. If you take it you will probably spend it for luxuries.

Lend this interest right back to your government by purchasing thrift and war savings stamps immediately. Buy the stamps right at the bank where you cash your coupons.

## Efficiency

The efficiency of the modern big guns is dependent upon the materials used and the precision of manufacture. The same care in the choice of materials, the same precision in construction, make the "Caterpillar" Tractor the most dependable, most efficient tractor. Many parts of this tractor are not permitted to vary the fraction of a hair's breadth from fixed standards. All materials are selected especially for the work they are to do. The result is power, endurance, economy. Let us send you complete information about the "Caterpillar" Tractor

## OUR ADVERTISERS RELIABLE

We guarantee our subscribers against  
 loss through dishonesty of any adver-  
 tisers in the Cultivator. We do not at-  
 tempt, however, to adjust trifling differ-  
 ences between subscribers and honest,  
 responsible advertisers, nor will we pay  
 the debts of honest bankrupts. Notice  
 of complaint must be sent us within 30  
 days from date of the transaction, and  
 the subscribers must have mentioned the  
 Cultivator when writing the advertiser.

## THIS WEEK'S COVER

One practical step being taken  
 by our federal government to aid pro-  
 ducers is given some attention on the  
 third page of this number. The bureau  
 of markets is one of the newer activi-  
 ties of the department, and it is prov-  
 ing most helpful to every producer.  
 The branches just established on the  
 Pacific Coast under direction of Mr.  
 Schleussner will give to the producers  
 the information so long needed in or-  
 der to have intelligent grasp of mar-  
 keting conditions. The Cultivator will  
 be glad to aid in connecting producers  
 with the directors of these branches,  
 and daily reports will be sent to ev-  
 eryone who has products to market.

## LOWER TAXES

A Covina subscriber writes:  
 "In the last eight or nine years I  
 have watched the taxes and assess-  
 ments on lands around here raising  
 beans, potatoes, etc., go up from a  
 very light burden to \$15 and \$16 per  
 acre, almost full rental value with  
 water. The producing value in dol-  
 lars of the land has remained about  
 the same and its renting terms the  
 same. Eight or nine years more at  
 that rate will fix things. It looks to  
 me as if a farm paper ought to pro-  
 test once in a while but maybe I am  
 mistaken."

There was never quite so insistent  
 a demand for lessening expense and  
 never quite so insistent an inclination  
 to increase expense as at this mo-  
 ment. Our taxes have been no excep-  
 tion, and there are some lands on  
 which such valuation has been placed  
 that farming as generally known is  
 impossible if the taxes are to be paid  
 from the income from the land. Hence  
 only specialized and intensive farm-  
 ing will make great returns possible.  
 People having lands on which these

high valuations are placed can only  
 succeed by most careful planning.  
 However, we hope that the powers  
 that be, such as boards of equaliza-  
 tion, assessors and budget makers,  
 will have a heart in placing these  
 great burdens on the producers of the  
 country.

## MORE WHEAT

On April 1 the department  
 forecasted a production of about 560,-  
 000,000 bushels of winter wheat. On  
 May 1 conditions had improved so  
 that the forecast was raised to 572,-  
 000,000 bushels. Last year's forecast  
 on May 1 was 418,000,000 bushels,  
 while the average production for the  
 five years preceding was 553,000,000  
 bushels. The largest production re-  
 corded was in 1914, when 685,000,000  
 bushels were produced. The acreage  
 planted last autumn was 42,170,000,  
 and it is now estimated that 13.7 per  
 cent of this has been abandoned. This  
 leaves over 36,000,000 acres, as com-  
 pared with 27,000,000 last year.

If the country is given fair weather  
 conditions until harvest an immense

We who are not privileged to fight in arms for our country—the men  
 too old to fight, the women not called upon to fight, the children too  
 young to fight—we must have one watchword, one resolve, beyond all  
 others till our boys return to victory, and that is sacrifice and service.  
 Let that be the controlling impulse of our actions and thoughts, so that  
 our sons and brothers may not lack for anything which it is in our power  
 to give or procure, so that our country may not fail in anything within the  
 utmost limits of our means, to insure and hasten victory.—Otto H. Kahn.

production will aid in the present food  
 situation. The planting of spring  
 wheat has been immense, but the de-  
 partment announces, "A report on  
 spring wheat will not be made until  
 June."

## BOTULINUS

It now appears that botulinus  
 will never become quite so popular as  
 appendicitis. Last season at vegetable  
 canning time reports of ptomain and  
 various other types of poisoning from  
 eating of canned vegetables and fruits  
 were so frequent that the question as  
 to the safety of eating these home  
 canned foods was often brought up.  
 We may look at it now as a form of  
 German propaganda or simply a mild  
 case of strabismus. We are now re-  
 assured, however, in an article issued  
 by the University of California. A  
 ten minute cooking of contents of can  
 after opening gives assurance of  
 safety. Read the article on page 625,  
 then can more. In fact, as long as  
 vegetables or fruits grow during this  
 season, can all you can.

To the end that the season may be  
 as successful for us all as possible,  
 will not all who had experience last  
 year in canning and drying send some  
 hint which will aid in greater and  
 more economical food preservation.

## WANTED—HUNDRED MILLION

The president of the United  
 States has proclaimed the days from  
 May 20 to 25 inclusive as time of  
 sacrifice. This for the Red Cross, the  
 great constructive force of war. It is  
 only a few months since this organi-  
 zation asked for a hundred million dol-  
 lars. It was given by the American  
 people in measure pressed down and  
 running over. These millions carried  
 comfort, or at least lessened suffer-  
 ing, in almost every corner of the  
 world, but of course to the greatest  
 extent in war-torn Europe, but the  
 need has only increased. The cry for  
 help is louder, and the money is be-  
 ing poured out in increasing measure,  
 so the management turns to the peo-

ple who created the organization and  
 is saying: "You must help us to an-  
 swer the call." The president has  
 said:

"The people of the United States  
 will be called upon to give generously  
 to the continuation of the important  
 work of relieving distress, restoring  
 the waste of war and assisting in  
 maintaining the morale of our own  
 troops and the troops and peoples of  
 our Allies by this manifestation of  
 effort and sacrifice upon the part of  
 those who, though not privileged to  
 bear arms, are of one spirit, purpose,  
 and determination with our warriors.

"In witness whereof, I have here-  
 unto set my hand and caused the seal  
 of the United States to be affixed."

## MILLION A DAY

Foreigners who have come to  
 make America their home have not  
 all come by the way of Ellis Island.  
 Some who have come there have been  
 hard enough to assimilate; others  
 which have been imported on fruits  
 or trees or plants are giving poor re-  
 turn for the hospitality shown them.

Careful observers now estimate that  
 insect and fungous pests which have  
 been introduced through carelessness  
 of importer and federal and state  
 quarantine stations are now causing  
 a loss to growers of this country of  
 over one million dollars daily. Of  
 course some of this awful loss is  
 passed on to the consumer, but the  
 farmer is the more direct and the  
 first sufferer. The federal horticul-  
 tural board and, in fact, all the people  
 now appreciate the cost of American  
 indifference, and while every year has  
 witnessed the introduction of some  
 new pest, the board, the entire depart-  
 ment of agriculture and quarantine  
 officials of nearly all Atlantic and  
 Pacific states are resolving to keep  
 out the pests. The federal horticul-  
 tural board has the power to prohibit  
 importations from countries infested  
 with these pests; it should use this  
 power more freely than it has.

One of these pests, pine blister rust,  
 has proven so serious to orchardists  
 and all who love to see the native  
 forests preserved that a committee or  
 large organization for the "suppres-  
 sion of the pine blister rust in North  
 America" has been organized. We be-  
 lieve there is none of this pest this  
 side of the Mississippi. None the less  
 will the Coast unite with the well-  
 wishers of the country in the effort to  
 stamp out the plague and stiffen the  
 backbone of quarantine officials so  
 that all of our ports may be more  
 closely watched.

## This Week's War Notes

Second Red Cross drive for \$100,-  
 000,000 begins Monday morning.

The latest war measure is to substi-  
 tute a big baked potato for the bun  
 in hot dog sandwiches.

The kaiser has announced: "It is  
 assumed that Lithuania will 'partici-  
 pate' in the war burdens of Germany."

Nearly a quarter million Italian  
 troops have been brought to France  
 to aid in repelling the expected Hun  
 drive.

Sir Thomas Hughes, premier of  
 Australia, with many Australian offi-  
 cials, is in California on the way to  
 a war conference in London.

A war conference in which Cali-

fornia's part was discussed from every  
 angle was held in Los Angeles this  
 week. Governor Wm. D. Stephens  
 presided.

The past week has seen eight steel  
 steamships completed and put into  
 active service, total tonnage 48,150.  
 New launches aggregated 14 vessels  
 with tonnage of 57,100.

Rumors of Hindenburg's "death" are  
 not taken very seriously by the Allies.  
 However, the disappointment of Ger-  
 many at the failure of the great drive  
 is such that the rumors may indicate  
 his political condition.

Germany's demands on Russia are  
 increasing the Russians' burden until  
 the feeling of unrest is increased in  
 every section. In some portions re-  
 mainants of the Russian army have been  
 brought together and have given many  
 an uncomfortable hour to German  
 troops.

The decrease in the U-boat cam-  
 paign is more and more notable. It  
 is rumored that Germany will soon  
 appear with a new type of super-  
 submarine which will have a far  
 greater cruising range. Both Amer-  
 ican and English navies are also be-  
 coming more effective in submarine  
 control methods.

"Rumania shall indemnify all Ger-  
 mans for damage suffered by them in  
 Rumanian territory; also all German  
 share holders in any enterprise in  
 Rumania." "Rumania renounces all  
 claims for damages caused in Rumania  
 as a result of German military meas-  
 ures." Queen Marie has announced  
 that she will abdicate rather than  
 reign over her country under German  
 "peace" conditions.

The Italian troops made a success-  
 ful assault on Mount Corno, which  
 was followed by counter attacks by  
 the Austrians, but the Italians have  
 held their advantage. The Austrians  
 make occasional efforts to renew the  
 drive, but the efforts of Austria at  
 this time seem to be needed to correct  
 internal conditions. Bread riots are  
 occurring repeatedly, and greatest of  
 suffering is reported from all sections,  
 especially Hungary.

A Belgian army officer in America  
 has remarked: "Anyone who talks  
 peace this year is a traitor to America  
 and the cause of the Allies." "The  
 length of the war will be gauged by  
 the amount of bone and sinew the  
 American people put into it and the  
 speed with which they move." "Sev-  
 enty-five per cent of your so-called  
 slackers are no slackers — they are  
 simply too sluggish to comprehend the  
 enormity of the situation."

The German submarine base of  
 Ostend, Belgium, has been success-  
 fully blocked by the sinking of the  
 old cruiser Vindictive which had been  
 used so successfully in the attack  
 upon Zeebrugge a couple of weeks  
 before. It is known that great dam-  
 age was done to the port. It was  
 accomplished with the loss of only one  
 small motor boat and less than a  
 dozen casualties to the English troops.  
 A few days later English aircraft suc-  
 ceeded in sinking an immense dredger  
 alongside the wrecked Vindictive,  
 which it is thought will close the har-  
 bor entrance for some days.

American forces are now occupying  
 a more definite portion of the line in  
 France than at any preceding time.  
 However, the battle line has been ma-  
 terially changed under the generalship  
 of Foch. Formerly the Belgians, the  
 English, the Canadians, Australians  
 and French maintained practically  
 separate armies on different portions  
 of the battle line. Under the present  
 plan there is one great army from  
 the North Sea to Switzerland, and its  
 unity of purpose is shown in the fact  
 that reserves of French or American  
 or other troops may be thrown into  
 line to aid English, Canadian or Bel-  
 gians as the needs may require. The  
 artillery action has been almost in-  
 cessant, especially in front of Ypres  
 and Amiens, and the Allies have been  
 in daily expectation of renewal of the  
 Hun effort to advance. American fly-  
 ers are becoming more in evidence,  
 and the announcement is made that  
 the Allies are dominating in air ac-  
 tivities. The Allies' forces have ad-  
 vanced slightly at various points, and  
 the English advance on either side of  
 Kemmel Hill is threatening that  
 stronghold, which cost many thou-  
 sands of German lives to capture.

# Agricultural News Notes of the Pacific Coast

## Northern California

A Hundred Million for Red Cross.  
Napa County is conducting a silo campaign.

Madison, Yolo County, held its rice festival last Saturday.

The Pacific Coast Land and Industrial Exposition will open in Oakland, October 6.

Napa and Mendocino grape growers are organizing to attack the Shepard bone dry bill.

County Horticultural Commissioner Mills of Butte County reports a death list of \$50,000 squirrels.

Paradise, Butte County, has its reservoir filled and plenty of water assured for the coming season.

Colusa is to have a cheese factory which expects to make an initial production of about 500 pounds daily.

Butte County is arresting vagrants and those who will not work and is confining and feeding on bread and water.

Placer County has a committee working on articles of incorporation for the mutual fire insurance organization.

The board of supervisors of Yolo County has passed an ordinance establishing 17 fire stations in various grain growing sections.

A mass meeting of fruit growers was recently held at Auburn and a movement was launched to secure more unity of action as to standards of fruit packs.

Alameda County contemplates a cow testing association, in fact, is now organizing and has 600 cows signed up. Members anticipate the number will reach 1000.

Glenn County reports fruit conditions normal; wheat crop at least 95 per cent of normal; barley outlook fine. The wheat planting has been increased over 6000 acres.

Yolo Power and Water Company has permission from the state railway commission to discontinue immediate irrigation service of alfalfa fields and serve water to the rice fields.

Placer County farm bureau meetings: Long Valley, May 18; Gold Hill, 20; Colfax, 22; Mount Vernon, 25; Roseville, 27; Lincoln, 29. Sheridan held its rabbit drive on the 14th.

Camp Fremont near San Francisco is being rapidly filled to capacity by trainloads of recruits. When it reaches full military strength there will be 27,500 men quartered there.

Butte County cattle and sheepmen using stock ranges on the Plumas forest reserve recently assembled at Oroville and organized. Another meeting will be held this week on Saturday.

California Swine Breeders' Association holds its annual meeting at Davis, Thursday and Friday of this week. An interesting feature is the hog feeding demonstration conducted by C. M. Vestal.

Sacramento Valley prune growers are hoping that the coming crop may be sold around the six and three-quarter cent basis. Meeting recently held at Chico was attended by 125 prune growers.

Vacaville's first cherries were shipped April 22, exactly the same date as 1917's first shipment. Yuba City made its first shipment April 21; Sacramento County, its first, April 23; Loomis, Placer County, April 22.

## Central California

A Hundred Million for Red Cross.  
Ceres, Stanislaus County, maintains it is now the "center of fig culture."

Turlock district has a dredger operating to establish a drainage system.

Terra Bella, Tulare County, estimates she will ship 200 tons of peaches and apricots.

Farm Adviser Jungerman of Stanislaus is advising the planting of honey sorghum for ensilage.

Nearly 30,000 acres of wheat on the west side of the San Joaquin Valley have been irrigated.

Stanislaus County farm bureau recently met and discussed regulation of prices of cereals other than wheat.

The Kearny properties of the University of California have been used to plant to Egyptian long staple cotton.

Owing to warm weather on the snows of the Sierra the Kings River is now running nearly 3000 second-feet.

Fresno's Raisin Day took on more of the military than any of the previous observations. It was the greatest ever.

A private reservoir on a ranch near Newman, was destroyed by the use of dynamite. It is thought to have been done as a pro-German act.

Oakdale irrigation board has ruled that water will not be delivered to lines where headgates and ditches are not in shape to handle water.

Irrigators under the Delmas ditch have secured a writ of mandamus against Turlock irrigation district compelling it to furnish water.

Dinuba is planning for a summer camp under the management of the Y. M. C. A. which will supply laborers for fruit harvesting and curing.

Kings County farm bureau is discussing the labor question and has recommended the closing of non-essential business houses such as saloons, pool halls, etc.

Women of Stanford University are organizing units to aid in the labor shortage which will prevail in the fruit handling of Santa Clara Valley orchards during July and August.

The San Joaquin Light and Power Company has appealed for "permission to increase its rates so that the company may earn eight per cent on its investment." "Daylight saving has reduced its revenue \$50,000."

The Valley Fruit Growers' Association has passed resolutions petitioning Governor Stephens to close all saloons during the period of the war. Wylie Giffen of the association stated that saloons lowered efficiency of transient labor at least 33 1-3 per cent.

The peach growers who had contracted during 1914-15 to deliver canning peaches for a period of years and who made appeal to canners for revision of contract, have secured concessions which will amount to from \$10 to \$12.50 per ton above contract prices.

A canvass of the food producing situation of the Turlock irrigation district indicates there will be grown this year 101,235 acres on irrigated land, while of this over 20,000 acres will be used for second crop. In addition there will be nearly 19,000 acres of food crops grown on non-irrigated land.

## Southern California

A Hundred Million for Red Cross.  
El Cajon, San Diego County, is now assured of a cannery.

Coachella Valley is discussing cotton and peanut growing.

Imperial County growers are making tests of castor bean plantings.

A cooperative cannery is being organized at Fallbrook, San Diego County.

La Habra farm center, Orange County, is holding citrus pruning demonstrations.

An effort is being made to include the east side mesa district in the Imperial irrigation district.

Effort is being made to organize the Southern California division of the National Defense League.

Several citrus growers are making practical test of the use of summer cover crops to prevent June drop.

Cattlemen of Imperial Valley have organized to protect grain fields from being fired by traitors and slackers.

A. L. Paschall has resigned as county farm adviser of Riverside and has been succeeded by R. N. Wilson.

Pomona, Los Angeles County, is making a pull for a sorghum mill and has nearly sufficient acreage pledged.

County Horticultural Commissioner Waite of Imperial is planning a thorough standardization of the cantaloupe crop.

Yucaipa Apple Growers' Association has purchased its entire supply of apple box shooks for next season's pack.

A violator of the state quarantine law at Ontario has been fined \$100 for shipping cotton seed infested with boll weevil into Palo Verde Valley.

Sonora wheat has done exceptionally well in Imperial Valley. One grower has 160 acres which it is estimated will produce 60 bushels per acre.

The last meeting of the season of the Claremont Pomological Club will be held at the home of its secretary, V. V. Leroy, in Los Angeles, Saturday, May 25.

R. S. Vaile, formerly connected with the citrus experiment station, has gone in the interests of the Armenian and Syrian Relief to aid in the agricultural development of Northern Persia.

Members of various citrus associations are uniting in the establishing of marmalade and jelly factories, which will handle low-grade and cull fruits in the manufacture of high-grade products.

Growers of Mecca, Riverside County, have organized and will operate a general merchandise store, maintain packing shed and buy and sell for the benefit of members. Single membership costs \$100.

Prof. Mason and Bruce Drummond are enthusiastic believers in the date industry of the Coachella Valley. They recently gave a demonstration of methods of removing offshoots from the parent palm.

Imperial County's cantaloupe crop covers about 10,896 acres as compared with 12,939 acres last year. Reports from the valley indicate an exceptionally fine yield and early shipments. It is anticipated this will be the first week for carlots or not later than the 20th will see first shipment.

The 1918 Canary Island onion seed crop will be materially reduced this year.

Benton County, Washington, stockmen have organized a protective association.

The war department recently ordered 5,500,000 pairs of shoes costing \$7.75 per pair.

It is reported that Washington contemplates a reduction in the prices of flour and flour substitutes.

The condensed milk industry is becoming a great factor in the commercial life of South Africa.

An experiment station in Brazil reports the cotton plant as one of the best honey yielders of that section.

A \$250,000 corporation has been formed at Chicago to maintain freight truck service between that city and New York.

The shipping board has announced the launching of a steel 88,000 ton cargo steamship 55 days from the laying of the keel.

High priced feeds have convinced some Arizona farmers that they can better afford to dispose of stock and sell feed direct.

Michigan and New Hampshire are the latest states to enter the prohibition lines in favor of the constitutional amendment.

The government reports a total tonnage of nearly a quarter of a million as the ship building record for April. It is now averaging over a 9000 ton vessel daily.

Over \$60,000,000 worth of engines and freight cars have been ordered by the administration. The order will be distributed between different factories over the country.

Sub-soiling by using dynamite is popular in New Zealand, and we note by commerce reports that "the best dynamite cartridges for this purpose are obtained in the United States."

Whitman County, Washington, has a fully organized farm bureau, and T. L. Kennard was recently appointed county farm agent. Other counties now fully organized with county agents are Chelan and Adams.

Commercial organizations of the South have determined that "The South must feed herself." In other words, cotton must give way to an extent and dairying and other food producing industries be installed.

Congress has enacted; "That it be unlawful to capture, kill, etc. or detain a homing pigeon wearing a band owned and issued by U. S. A. One hundred dollar fine and six months imprisonment may be the punishment.

The Okanogan County, Washington, Stockmen's Association is working for a state enactment providing "that all stray stock be advertised as estrays with full and complete details as to color, age, sex and distinctive marks."

The Manchurian Produce Exchange is endeavoring to secure a standard of oil percentage on soy beans. Mills maintain they are able to secure an average of only about 12 per cent of oil, while some beans show a 20 per cent content.

## The Heart of The Milking Machine

**THE** pulsator is the heart of any milking machine. It controls and regulates the action of the teat cups on the cow's teats.

A man with a weak heart would not be accepted for military service. You should not accept any milking machine with a weak heart. The Perfection has the heart of an athlete. His heart beats are strong and steady. He can stand lots of work and thrives on it. The Perfection pulsator is simply a piston working back and forth in a brass cylinder, no cog wheels, weights, levers or "clock work." It does not easily get out of order, and with ordinary care it should outlive any other piece of machinery on the farm. The Perfection milks as the calf does, with a gentle suction, a downward squeeze, followed by a period of complete release. The pulsator can be instantly adjusted to suit either a hard or easy milking cow. This point is a very

important one. Not all cows milk alike and the Perfection recognizes this fact.

The action of the Perfection on the cow's teats, which is nature's way, and the possibility of adjusting the machine to suit different cows are two of the many points in which the Perfection excels all other milking machines.

Newman Bros., Elk Grove, Cal., write:

"As you know we produce certified milk and would not be allowed to use any machine that would injure a cow's teats or udder or adversely effect the bacteria count. We have milked entirely by machine for about two years with perfect satisfaction to all concerned, including the cows. One man with ordinary intelligence is doing with the machine what it required three men to do in the old way. We would convict ourselves of being either philanthropists or fools were we to go back to the old way. We are familiar with most makes of milking machines and have tried out several of them. The Perfection is superior in several respects. First: Both suction and squeeze can be changed instantly and adjusted to the individual cow. This is a mighty good thing, as any milker ought to know. Second: The Perfection will milk more cows in a given length of time. Third: The Perfection pulsator is more simple; has fewer wearing parts and is easier to adjust. Fourth: The teat cup rubbers last much longer than on one other machine which we tried. I cannot understand the dairyman, who modern in every respect, will go on milking by hand when he could cut expenses and make dairying more attractive, to say nothing of sanitation, by using a Perfection Milking Machine. When we need more milking machines, the order is yours."

## Elliott-Brant Rancho Guernseys

We have an especially fine bunch of young Guernsey bull calves to choose a future herd sire from. Guernsey bulls cross well with all breeds of cattle and they increase the quality and color of the milk as well as the quantity of milk and butter fat. The Guernsey bull has won the battle with the scrub cow.

We have calves from A. R. cows with different sized records up to 750 pounds of butter fat. Our prices are reasonable and are based on breeding and records. Write and tell us your needs and we will tell you how we can fill them.

## Holstein Auction Sale at Modesto

Written for California Cultivator By C. A. Briggs

**H**OLSTEIN breeders of the north San Joaquin district held their first consignment sale on May 9 at Modesto.

Thirty-four head were sold for \$12,475, an average price of \$375. The stock sold was mainly mature females of a very high grade quality; bidding was brisk and sales made to almost an entire set of new buyers. The most notable feature of the sale was that the cattle were sold almost without exception to practical dairymen who paid handsome prices for their choice. Every recent sale shows marked progress along this line but the tendency was more evident at this sale than at any previous one. This result is without doubt largely due to the broad minded, wide spread campaign of advertising and educational work of the California Breeders' Sales and Pedigree Company who conducted the sale. Their policy of conducting absolutely clean sales, standing back of the cattle sold, that every cow must be free from contagious disease and a breeder or money back has inspired the dairymen with confidence, and they now show their faith in these methods by buying good animals at prices that a few years ago they would not have thought of paying.

The day was a good one, sale well managed, prices satisfactory to both buyers and sellers. The greatest number (five) was bought by Wm. Lehfeldt of Livingston. The top notcher, Senorita Ceres Mechthilde, consigned by R. L. Holmes of Modesto, was knocked off to H. H. Wallis of Crows Landing for \$605.

Col. Cy Clark of Modesto acted as auctioneer, Charles E. Hughes as sales manager. Consignors and buyers as follows:

J. W. Benoit, Modesto: Koroba Electa, Koopman Dairy Company, Pleasanton, \$500; Electa Pontiac Koroba, C. H. Hull, Atwater, \$540; Venteta Electa Netherland, M. R. Moody, Modesto, \$400; Venetta Electa Netherland, Koopman Dairy Company, Pleasanton, \$450; Elfreda

Estrata, M. R. Moody, \$475; Modesto Zenobia 3rd, Wm. Lehfeldt, Livingston, \$560; Melba Zenobia Pontiac, H. E. Cornwell, Modesto, \$300; Azalea Zenobia, C. H. Hull, \$400; Pauline Hermana, Koopman Dairy Company, \$275; Esmeralda Electa Pontiac, W. Batterbury, Crows Landing, \$470; Zella Hermana Pontiac, R. C. Sturgeon, Tulare; Princess Pontiac Ruby Burke, W. Batterbury, \$450; Salambo Pietertje, P. Brunold, Modesto, \$340; Clover Lad Wayne Colantha, E. Thorkelson, Patterson, \$140.

J. A. Pelanda, Modesto: Squaw Queen De Kol 2nd, C. A. Miller, Ripon, \$350; Lassie Delmar Pauline De Kol 2d, R. C. Sturgeon, \$485; Brinka Hengerveld of Pelandale, R. C. Sturgeon, \$300.

R. L. Holmes, Modesto: Holland Aaggie Belle Colantha 2nd, R. C. Sturgeon, \$530; Senorita Ceres Mechthilde, H. H. Wallis, Crows Landing \$605.

H. E. Cornwell, Modesto: Lady Holland 3rd, R. C. Sturgeon, \$430.

Gotschall & Magruder, Ripon: Vee-man Hengerveld Pride 3rd, Wm. Lehfeldt, \$450; Urana of Linwood, F. E. Hess, Lindsay, \$475; Stratford Juliana Maid, D. Salfeld, Stockton, \$335; Pauline Clothilde Pondyke De Kol, Wm. Lehfeldt, \$410; Netherland Lily De Kol, S. Boren, Modesto, \$375; Moorland Romeana De Kol, Wm. Lehfeldt, \$300; Baby De Kol Pietertje, W. L. Choisser, Riverdale, \$210; Arabella of Linwood, R. T. Brooks, Merced, \$375; Alma Goldstone Fidesa, Mrs. O. E. Warnock, Modesto, \$555; Aaltje Vale Cornucopia, A. M. Bibens, Modesto, \$230; Karlray Fobes Juliana A. M. Bibens, \$255; Prince Pontiac Jose Karlray, Wm. Bond, Newark, \$165; K. P. O. S. Pondyke Karlray, Z. J. Funk, Ripon, \$100; Moorland Colantha Primrose, R. E. McCracken, Ripon, \$170.

Consignors' averages were all over \$300. J. W. Benoit, 14 head, \$402; Gotschall & Magruder, 14 head, \$314; J. A. Pelanda, three head, \$378; R. L. Holmes, two head, \$567; H. E. Cornwell, one head, \$430.

## Destroy Cattle Lice

**C**ATTLE lice are injurious to all classes of cattle, but the greatest losses occur in young stock and poorly nourished old animals. Losses are caused by irritation, digestive disturbances, arrested growth, low vitality, and increased death rate. The methods of preventing these losses and ridding the cattle of lice are described in Farmers' Bulletin 909, "Cattle Lice and How to Eradicate Them," recently published by the United States department of agriculture.

Ordinarily lice on cattle are not observed until they become so numerous that they cause unmistakable signs of annoyance. Usually the animals whose lousy condition first attracts attention are the poor, weak, unthrifty members of the herd, and frequently the owner thinks they are lousy because they are unthrifty,

whereas the unthrifty condition may be caused by the lice.

**Can Not Thrive**

Three kinds of lice are commonly found on cattle, and all three species may be present at the same time, but the same method of treatment may be used for any of them. When they make their appearance on the cattle during the fall or winter they usually spread rapidly until every animal is infested. When a herd is grossly infested it is not uncommon to see some animals with large areas of skin partly denuded of hair, and limited areas bruised and raw from rubbing against posts and other objects. Cattle in this condition will not thrive or gain weight normally, and during winter often remain stunted until the old coat of hair is shed in the spring, at which time most of the lice disappear. Hand applications, spraying, and dip-

Feeding Sheds

View of Feeding Sheds on University Farm at Davis. This shows open side with driveway. Hay or roughage may be unloaded direct from wagon without driving into corral, a great number of which on opposite side of this shed permit stock to feed at their own pleasure.

A. B. COMFORT - Guernsey, Cal.

ping with insecticides are the methods which the bulletin recommends as remedies. In southern latitudes where the winters are mild cattle may be dipped during the winter months without injury from cold weather, but in the northern sections winters are usually too cold for dipping or spraying. All animals in the herd should be treated regardless of the number showing infestation, and the treatment should be repeated in 15 to 16 days.

### Homemade Remedies

Hand applications are practical only when a few animals are to be treated, but are especially valuable in holding the parasites in check during weather too cold for dipping or spraying. Some dusting powders obtainable on the market are good when this method is used. The following homemade liquid remedies are also effective: Equal parts cottonseed oil and kerosene, or kerosene and lard mixed in the proportion of one-half pint kerosene to one pound of lard or crude petroleum. Apply these remedies with a brush or cloth, covering the entire body, being particularly careful about the head and ears. For spraying and dipping arsenical dips, coal-tar creosote dips, and nicotine solutions are recommended. They may be applied with a hand sprayer, but the most effective method, the bulletin states, is to provide a dipping vat and completely dip the cattle two or, in some cases, three times. Complete directions for making and using a dipping vat are outlined in the bulletin referred to, which may be obtained, so long as the supply lasts, by applying to the Department of Agriculture, Washington, D. C.

### HOLSTEIN-FRIESIAN ANNUAL

The thirty-third annual meeting of the Holstein-Friesian Association of America will be held at Milwaukee, Wisconsin, June 5.

Several amendments to the constitution are proposed and officers will be elected. Present officers are: President, Hon. D. D. Aitken, Flint, Michigan; vice-president, G. Watson French, Davenport, Iowa; secretary, Frederick L. Houghton, Brattleboro, Vermont; treasurer, Wing R. Smith, Syracuse, New York; superintendent of advanced registry, Malcolm H. Gardner, Delavan, Wisconsin.

### DAIRY CATTLE CONGRESS

The ninth annual Dairy Cattle Congress will be held September 30 to October 6, 1918 in its permanent home at Waterloo, Iowa. This is the great yearly event of the dairy industry in the Middle Western states.

The industrial world is facing gigantic problems different from any it has solved heretofore. These problems necessitate greater activity, more strenuous effort and the necessity for greater achievement. People are asked to conserve all possible lines and at the same time increase production. Events such as the Dairy Cattle Congress are for the purpose of encouraging both conservation and production and have not only the sanction but the hearty recommendation of the government.

The economy which makes one horse a dollar rather than to put that dollar to work where it will multiply many times is ridiculous business judgment. It is not conservation, it is not loyal business policy and the men who come to the Dairy Cattle Congress year after year are not the type who follow such practices.

From the standpoint of the visitor, the Cattle Congress is of twofold importance. In the first place, it brings him face to face with the latest achievements along manufacturing lines. It shows him what the manufacturing world offers in the way of labor saving machinery, and those conveniences which are fast taking the drudgery out of every phase of farming.

Further than this, one of the most difficult problems the farmer is called upon to solve today, is that of help. How is he going to get his work done with labor conditions as they are? He cannot do more himself, yet the incessant call is for more production along every line. How is he going to meet it? The answer is, labor saving machinery, and here is where he may put himself on the latest things along these lines.

In the second place, the programs

which form a most important feature of the Cattle Congress, bring together the best authorities on subjects that are of vital importance to the men who believe in keeping thoroughly posted and up-to-date in their business. Dairying is a business just as much as merchandising or manufacturing. It is one of the most important lines of activity in touch with hu-

man life. This has been brought out with decided emphasis during the recent investigations that have been made along the lines of the foods that are best adapted to the nourishment of the human race.

These are a few of the reasons why the Dairy Cattle Congress is always an event of extreme significance, and why it is of more importance this year than ever before.

## University Farm Produces World Record Breaking Goat

NEW and unusual distinction has come to the University of California in the field of stock raising. "California Gretel," purebred Toggenburg, has broken the world's record for milk production in goats. She has given in 365 consecutive days 2941.5 pounds of milk and 97.41 pounds of butter fat. This amount of milk would furnish a family with 3.8 quarts of

milk in ten months, and her grandmother, "El Chivar's Geneva," gave over 2100 pounds in ten months and was the grand champion Toggenburg doe at the Panama Pacific Exposition in 1915. Her pedigree traces in almost every line back to the handsome imported buck, "Prince Bismark."

Goats are gentle and affectionate and soon become family pets. They are extremely intelligent, as much so

California Gretel

The upper picture of California Gretel, the wonderful Toggenburg goat whose great production of milk has surprised the world, was taken with the Cultivator camera on Farm Picnic Day. One of the first of the university staff whom we met was Prof. Gordon H. True who has used of his energies and of his knowledge of live stock to add much to the credit of California. He took California Favorite and Jock to the International, 1916, and surprised the world, even including California. But that is a long story. As soon as we saw Prof. True he wanted to show us this little wonder milk producer. Note the look of intelligent interest on the face of the little animal as she listens to Prof. True's instructions to look her prettiest. Yesterday we received from the university the lower picture. It was rushed to the engraver with instructions to have ready for this week. Count those milk cans and compare them with the size of the little animal—34 cans with a capacity for holding 2,941.5 pounds of milk. When it comes to making up the record of war activities we think California Gretel can say; "I done my best."

milk a day throughout the year. If the fat in the milk were churned into butter, it would make 120 pounds of butter, or enough to supply the needs of a family for a year. If this milk were made into Neufchatel cheese, it would make over 450 pounds of cheese, or over a pound of wholesome cheese per day throughout the year. This cheese, retailed at 30 cents per pound, would be worth \$135. This goat's milk, retailed to infant hospitals at 25 cents per quart, would be worth \$350.

This goat had an average weight of only 120 pounds and the milk she gave during the year would be about 24½ times her body weight, which excels the record of the best Holstein cow.

"California Gretel" comes from royal blood. Her mother, "El Chivar's Gretel," gave over 2250 pounds of

as most dogs. They are little trouble to milk and in fact like to be milked, as they will jump up on the milking stand of their own free will at milking time and seldom raise a foot while being milked. Goats are easy to care for and are rarely sick. Any food that is good for cows is relished by goats, as well as many other things such as vegetables and tree leaves and twigs. Although they need good food to do their best, anyone with a back yard can keep a goat by providing a little alfalfa hay and grain to supplement the vegetable waste from the table and the lawn clippings.

A good goat should keep up a fair flow of milk, say two to three quarts a day, for from eight to twelve months, but cannot be milked continuously between freshenings without harm to the goat. To avoid this, the best plan is to keep two goats.

Machinery and Repairs: Baker, Hamilton & Pacific Co., San Francisco; Dixon & Griswold, Los Angeles.

### ORGANIZED EFFORT FOR CATTLE PROTECTION

The Cattle Protection Board, Underwood Building, San Francisco, informs cattlemen that the work of organization has proceeded in a very satisfactory way and the entire Act is now in operation with the exception of inspection of cattle before shipment, and it is hoped, in the very near future, to arrange for the appointment of inspectors to do this work.

All brand applications received have been classified and card indexed and certificates of brand registration are being mailed at the rate of several hundred daily. Many duplications of brands occur in all counties and the number of these is very much greater than was expected, indicating that in the past many brands exactly alike have been used by numbers of people in the same localities, which condition must have caused confusion among cattle owners. The present law will do away with this and it has already been highly commended by many cattlemen for its beneficial effect. Scores of letters are mailed daily requesting information from brand owners which will enable the board to adjust these duplications. This, of course, is slow and painstaking work and requires considerable time.

All cattle slaughterers are also being registered and bonded, and monthly slaughtering reports to this board are required from them. This enables us to keep an accurate record of all cattle killed, from whom they were purchased, etc., and will go a long way to prevent cattle rustling.

Preliminary work has already been conducted pertaining to cattle rustling and the board is prepared to investigate such reports at any time, upon notification. It particularly requests cattlemen to communicate with it immediately in the event of having cattle stolen.

### JERSEY PRIZE OFFERS AT LIBERTY FAIR

The American Jersey Cattle Club has offered to supplement the premiums offered by the Liberty Fair which is to be held in Los Angeles next October by \$140 in premiums divided as follows:

Fifteen dollars each to cow having a Register of Merit record for one year; cow having Register of Merit record for one year shown with two of her progeny; bull entered in Register of Merit, shown with four of his progeny, at least two of which must be females in milk; get of sire—four daughters of one bull, six months or over, two of them in milk; breeders young herd—one bull six months and under two years, two heifers one year and under two years, two heifers two months and under one year, females to be bred and owned by exhibitor; exhibitors herd—one bull two years or over, one cow three years or over, one heifer two years and under three, one heifer one year and under two, one heifer over two months and under one year, owned by exhibitor.

Ten dollars for produce of one cow: two animals over six months, at least one to be a female.

Twenty dollars each to grand champion bull exhibited by his owner, who must have been his owner for one year or over; grand champion female, exhibited by her owner, who must have been her owner for one year or over.

### WOOL STOCKS IN THE UNITED STATES

Stocks of wool held by dealers and manufacturers in the United States on March 31, 1918, amounted to about 427,000,000 pounds, grease wool equivalent, according to the quarterly wool report just issued by the bureau of markets of the department of agriculture. This figure compares with 585,000,000 pounds on June 30; 636,000,000 pounds on September 30; and 562,000,000 pounds on December 31, 1917. Imports during January, February and March of this year amounted to 111,378,688 pounds, including mohair and alpaca.

Stocks on March 31, 1918, in pounds, by classes were: Grease, 222,814,951; scoured, 46,559,630; pulled, 27,844,141; tops, 19,671,821; and noils, 17,441,316.

So long as the boys are at the front, difficulties are to be subdued, impossibilities to be trampled down.

# Botulinus Poisoning

Boil Canned Vegetables Ten Minutes

During the past few years a number of fatal cases of poisoning have occurred from eating fruits and vegetables put up in the home in cans and jars. The poisoning is caused by a very powerful toxin produced in the canned food by the growth of a bacillus or germ known as Bacillus Botulinus. If the food in the jar or can is not sufficiently sterilized by heat the spores of the bacillus are not killed. These will grow later in the sealed can or jar and produce a toxin which is so poisonous that a single grain of canned corn or peas infected with the bacillus will be sufficient to cause death. The bacilli themselves are not infectious, but it is the toxin produced by them in the food that is dangerous.

Botulism or botulinus poisoning, is not the same as ptomain poisoning; although most cases of botulism are incorrectly reported in the newspapers as "ptomain poisoning." Ptomain poisoning is caused by the eating of partially decomposed protein substances, such as meat and fish. Ptomains are much less poisonous than botulinus toxin and occur in products whose decomposition can be easily recognized by the odor. Ptomains are not destroyed by any amount of cooking and boiling. Botulinus toxin, on the other hand, is easily destroyed by boiling. Botulinus poisoning is usually fatal; ptomain poisoning does not so often result fatally.

Until recently botulinus toxin was considered to occur only in meats. It has now been proven, especially by Dr. Dickson of Stanford, that some fruits and many vegetables have caused fatal cases of botulinus poisoning. Several deaths recently occurred at Madera and San Bernardino from eating apricots infected with botulinus. Asparagus, string beans, and corn have all caused fatal poisoning from botulinus. Sausage, chipped beef, commercially canned beans, and pork and beans, according to Dr. Dickson, have all been causes of botulinus poisoning.

The presence of botulinus in canned food is usually indicated by a characteristic rancid odor. This odor in some cases is easily recognized, but in others may be so slight as to pass unnoticed.

The poisonous principle acts by being absorbed by the blood stream from the digestive tract. It is one of a very few toxins that can be so absorbed. The germs themselves can be taken without causing serious trouble if they are free from the toxin.

Botulinus toxin will kill chickens and other fowls or animals. Cases are on record where canned vegetables that possessed a rancid or suspicious odor have been fed to chickens which were killed. An advanced symptom of the disease is paralysis. In chickens the neck is first paralyzed causing a condition known as limber neck. The chicken loses the power to keep its head erect. If suspected material is boiled it may be fed to animals or fowls with safety.

## Destroyed by Boiling

Where there is any doubt as to the sterility of home canned foods or foods put up in jars, they should be boiled for ten minutes after the container has been opened and emptied for use. Boiling destroys the toxin and in this way renders the food non-poisonous. Canned vegetables, if to be used for salad, should be boiled for ten minutes and allowed to cool before use. This is especially true of asparagus and string beans.

## Use Safe Methods of Sterilizing

If the proper methods of sterilization are used, home canned foods are just as safe as those canned commercially. Sterilization of vegetables under steam pressure as directed in Circular 158 of this station and in various United States department of agriculture bulletins is one of the most satisfying methods. The lemon juice method described in Circular 158 and in Illustrated Methods of Food Preservation 1 of this station has been tested during the past year and been found to destroy the spores of bacillus botulinus in vegetables heavily inoculated with this organism. This method consists in canning or putting up vegetables in jars in a dilute brine acidified with from five to six fluid

ounces of lemon juice or very strong vinegar per gallon, followed by sterilizing in the can or jar in boiling water in a washboiler sterilizer for one to two hours. (Write College of Agriculture, Berkeley, for copies of Circular 158 and Illustrated Food Preservation Leaflet 1. This and other methods are described in these publications.)

Vegetables may also be safely sterilized by three sterilizations in the can or jar in boiling water for one hour or more on each of three successive days. This is known as the "intermittent" or "three-day" method.

Another method commonly used is the "one-day" method. Where this method is used the vegetables must be sterilized in the can or jar in boiling water for a very long time in order to be sure that the spores are all killed.

Fruits should be sterilized in the jar or can in boiling water for the times given in publications above referred to.

Meats should always be sterilized in the can or jar under pressure or by the three-day method; never by the one-day method at the boiling point.

In sterilizing cans or jars of food in a washboiler sterilizer, count the time of sterilization from the time the water boils vigorously. This is extremely important.

## In Case of Poisoning

The symptoms of poisoning usually develop slowly, and by the time the case has fully developed little can be done to counteract effects of the poison. Where the poisonous nature of the food is discovered in time a great deal of the toxin may be eliminated by giving a strong emetic, such as tartar emetic of warm mustard water, and a strong purgative such as castor oil. It is sometimes possible in this way to eliminate the poison before it is absorbed from the digestive tract. Call a doctor at once.

Several laboratories are now at work on the production of an antitoxin to be used to counteract the effect of the botulinus toxin. These efforts have not yet met with full success. It is probable that such an antitoxin will in time be developed and used with success against botulinus toxin.

## Summary

Botulinus poisoning is caused by eating food in which bacillus botulinus has grown and produced botulinus toxin. The toxin ranks with rattlesnake poison in deadliness.

Botulinus bacilli sometimes survive the sterilization of fruits and vegetables where improper methods are used. Meats, string beans, peas, corn, asparagus, apricots, and pears, have all caused poisoning.

The foods must be sterilized in the can or jar by some one of the safe methods recommended in publications of the University of California, Agricultural Experiment Station Circular 158 and Illustrated Food Preservation Leaflet 1, in order that danger from botulinus shall be avoided.

Boil all vegetables for ten minutes after the jar or can has been opened for use.

Do not feed suspected material to valuable fowls or animals without boiling it first.

In case of botulinus poisoning call a doctor at once and in the meanwhile give an emetic and a purgative.

## UTAH EXPERIMENT STATION BULLETIN

The Utah agricultural experiment station has just issued Bulletin No. 161 on orchard heating by Dr. F. L. West and N. E. Edlefsen. The general conclusion reached is that while in most cases it is possible to protect the fruit, yet, at the prices received for fruit in Utah during the last few years, the cost of heating is, in most cases, greater than the value of the fruit saved. Present prices, however, will probably justify heating that would not be profitable in normal years.

This publication is being distributed free of charge by the Utah Agricultural Experiment Station, Logan, Utah, to all who desire it.

## QUICK AND ECONOMICAL TRANSPORTATION

# Nash Trucks Speed Up Hauling

Wheat, the life food of the world, must go from field to town in the shortest possible time. Nash trucks speed up wheat hauling and reduce its cost.

They carry bigger loads than the horse drawn vehicle and do not need rest between loads. Equipped with electric lights, they work night and day, if need be, in busy harvest time.

Many superior mechanical features fit Nash trucks unusually well for this service. All Nash trucks are equipped with M. & S. automatic locking differentials. The driving wheels cannot spin. This saves tires and fuel. It lets Nash trucks get through where other trucks without this important feature cannot go.

The unusually strong internal gear drive axles of Nash trucks are simpler and lighter than others. This type of axle also delivers more power to the truck's driving wheels, especially at low engine speeds.

Our transportation expert will be glad to tell you which Nash truck can serve you best.

### TREES

**For Sale to Nurserymen or Large Planters**—Owner of a large block of very fine Eureka Lemon trees will sacrifice at a ridiculously low price to those who will take a large quantity. These are not old dirty culled over stock, but strictly first class trees, clean, thrifty and straight, budded high on sour stock, never have been frosted or stunted in any way. Ground has to be vacated by June 1, so this stock will actually be sold at LESS THAN SEEDLINGS CAN BE RAISED. Address X, California Cultivator.

### AVOCADOS

The Spinks is easily the best variety that has fruited in California. It combines the good points of all the others with none of their defects. A rugged, prolific tree and a superb fruit. Field grown trees of this and other well known varieties, including the Rey, Linda, Sharpless, Fuerte, L. X. L., Caribou and others, \$3.00 to \$5.00 each. Liberal discount in quantities. W. A. Spinks, Duarte, California.

**For Sale**—Extra fine Valencia trees, ½ to 1½, all sour root, high buds, very thrifty, clean and straight, not fertilized, excellent soil for balling, nothing better grown. Can supply a limited acreage yet closing out entire lot of these fine trees. S. R. Coate, 564 S. Los Angeles St., Anaheim, Cal. Phone, Anaheim Pacific 403-J.

**Avocado Trees**, budded, Fuerte variety; a hardy, vigorous grower, bears a rich, delicious fruit. Eighty per cent of all avocado trees planted this year were of the Fuerte variety. Our trees are field grown, straight, symmetrical, with large balls. Send for illustrated, descriptive circular, showing prices. WEST INDIA GARDENS, Altadena, California.

**Here is Your Opportunity to Secure A-1 citrus trees.** We offer several thousand 2-year-old lemons; Eureka and Villa Franca, also Washington navel; also several hundred Valencias on sweet root. We call these good trees and we know whereof we speak. ALBERT JACKSON, Upland, California.

**100,000 Sour Orange Seedbed Trees**—50,000 sweet; choice new stock. Trees lined out this year sure to hit high market. Better plant a few thousand next spring. Southland Nurseries, 1941 East Colorado, Pasadena.

**Valencia Orange and Eureka Lemon trees** one year past, ¾ to 1 inch. Pedigreed stock on sour root, high buds. We will bud 6000 choice seedlings to your order. Seed bed stock for sale. Randall Bros. Nurseries, Whittier, Cal.

**For Sale**—About 25,000 uncultured lemons, Navel and Valencias of the very highest character of pedigreed stock must be removed at an early day from present location. Will sell in the field at 10 cents apiece. Apply John Hinkle, Lordsburg, California.

**Citrus Stock**—Very best Valencia and Eureka lemon trees. Two years old. Pedigreed stock. Big strong root system. Grown at San Dimas. Price right. Smith Citrus Nurseries, 1121 Investment Building, Los Angeles. M. 3604; F. 2729.

**By Far the Lowest Priced means of reaching a buyer for what you have to sell** is through classified advertisements in California Cultivator. The cost is only 3 cents per word per issue, with a minimum of 35 cents.

**For Sale**—All kinds Citrus Nursery stock, 1 and 2 buds, fine roots. Y. Yamaguchi, Box 574, Phone Sunset 470R, Upland, 10th St. and Cucamonga Ave., Upland.

### SPECIAL

**Be Patriotic**—Raise stock, Oregon, California openings. Valuable land marked plainly on County sectional map. \$2.50 any county. Booklet Free. Joseph Clark, Sacramento, California.

### RABBITS

**Go into Business for Yourself**—Raise rabbits for meat and fur. Raise stock for us. We buy all you raise. Orders booked now for March delivery. Our booklet mailed for 10 cents. Los Angeles Fur Farm, Dept. C. C., 2669 N. Griffin Ave., Los Angeles.

**Money in Rabbits**—Raise rabbits for us. Will pay \$6.00 per pair. Send stamp for reply. H. E. Gibson Co., Arcadia, California.

**For Sale**—Rabbits. New Zealand and Flemish Giant, young stock. Paul Kruger, Watsonville, California.

### GOATS

**Toggenburg Milch Goats**—Rae P. Williams, Federal Realty Building, Oakland, California.

### POULTRY

**Our Yearly Sale**—Breeders, Eggs. Usually July; but make room for growing stock, AT ONCE. Our surplus are offered at half what they cleared this year. Pens, trios, pairs, hens. Eggs, males, birds, low half. Surplus 12-week pullets, chicks reduced. Leghorns, Wyandottes, Rocks, White, Barred Rocks, Anconas, Minorcas, Orpingtons, Brahmas, Ducks, Geese, Turkeys. Some of best hens in California; trapezoid by governments, 200-283 eggs yearly. Investigate quick. James Beeson, Pasadena, California.

**Model Poultry Farm**. White Leghorn specialists, established 1903. We are now booking orders for May and June delivery of Baby Chix and Hatching eggs from our bred-to-lay stock. We still have a few 10 weeks old pullets to sell. Our prices are right. W. C. Smith, Prop., Corning, California.

**Baby Chicks**—All good strong youngsters. Hatches every week. White and Brown Leghorns, Rhode Island Reds, Barred Rocks, Black Minorcas, Anconas. Also hatching eggs. Write for circular. J. H. Stubbs, Campbell Poultry Ranch, Campbell, Cal.

**Baby Chicks**, Ancona, Rhode Island Reds, \$16.00 per 100. Barred Rocks, \$17.50. MacFarlane Quality White Leghorn, \$12. Many other breeds hatching every week. D. E. Duke, 743 So. Los Angeles St., Los Angeles.

**For Sale**—Lo-Glo, Electric incubators and hovers, absolutely guaranteed. Send for circular. Winning strains Rhode Island Red eggs, \$1.25 for 13. Breeders ready for delivery and orders taken for baby chicks. Greenleaf Bros. & Cushman, 2228 Greenleaf St., Santa Ana, Cal.

**Baby Chicks**—White Leghorn and R. I. Reds. Hatches every week. Any quantity, only first class chicks sent. Write for prices. E. W. Ohlen, Campbell, Cal.

**Book Your Orders for White, Brown or Buff Leghorns, Anconas, Barred or White Plymouth Rocks, Black Minorca chicks with the Stevenson Hatchery**, Watsonville, Cal.

**White Leghorn Baby Chix** from heavy-laying (Hoganized) stock; \$10 per 100. We guarantee safe arrival. The PIONEER HATCHERY, 409 Sixth St., Petaluma, California.

**White Rocks, White Wyandottes, Rocks, Reds, Anconas, Minorcas, White, Brown and Buff Leghorns**. Folder and price list. E. W. Archibald, Soquel, Santa Cruz County, California.

**Chix**—Buff, Brown, and White Leghorns (Barron strain), Anconas, Minorcas, Reds, Orpingtons, Rocks, Silver Campines and breeding cockerels. Enoch Crews, Searight, Cal.

**Black Orpingtons Lay, Weigh and Pay**—Prize winners at leading shows. Write for mating list. IVEYMOOR FARM, San Leandro, Cal.

**"Eastman's Bred-to-Lay"** Hoganized, trap-nested Barred Plymouth Rocks; chicks and eggs. Fairmead Poultry Farm, Fairmead, California.

**For Sale**—Barred Rock, R. I. Red and White Leghorn chicks. Reduced prices. Fine stock. Madera Hatchery, Madera, Cal.

**For Sale**—1200 laying hens to party who will continue business, I will give free rent of fully equipped poultry ranch. Chas. P. Graham, Palms, California.

### LIVE STOCK

**D. E. Kelliher**—Importer and Breeder of Hampshire sheep, Eugene, California, offers for sale a choice lot of yearling Hampshire rams sired by Walnut Hall and Butterfield Rams, purchased at Salt Lake, August, 1916, also a few yearling ewes of same breeding. Inspection and correspondence invited.

**Sheep for Sale**—About 1000 head of Black Face and Merino Ewes. A good buy. Address John G. Mee, St. Helena, California.

### MACHINERY

**FOR SALE—WHY BUY NEW? SAVE YOU HALF**

**MATERIAL GUARANTEED USED PLOWS, CULTIVATORS, DRILLS**—Extension disc cultivator, \$29.50; single disc riding plow, \$47.50; 14-in. Gilpin Deere riding plow, \$32.50; 4-gang Stockton, fine shape, \$27.50; spike harrows, \$16; mowers, \$39.50; rakes, \$25; corn planter, \$22; corn cultivator, \$45; spring tooth harrow; sundries, cheapest in town. BEET DRILLS—Ready to ship, \$39 up. WINDMILLS—16 ft. mills for irrigating, \$95; 8, 10, 12 ft. mills.

**HOW'S THIS?** 50,000 gal. Redwood tank, lug hoops and 40 ft. tank stand, \$375; 1500 gal. \$22; galv. drums, \$4; 50 gal. hot water boilers, \$3.50; 8000 gal. heavy corrugated galv. tank, \$135; 10,000 gal. heavy corrugated galv. tank, \$175; 900 gal. heavy riveted steel tank, \$68; wagon tanks, \$28 to \$48; new, used, redwood, galv. tanks all sizes, 1200 ft. fine 4-in. O. D. casing, 29½ cents.

**COMPLETE PUMPING PLANT NEARLY new** 40 hp. West Coast engine and large double acting deep well plunger for 350-ft. well with 9-in. cylinder and 350 feet 11-in. casing cost \$4500, our price \$1950. DEMMITT CO., downtown office, upstairs, 120 N. Main St., Los Angeles.

**REMANUFACTURED PIPE**—All sizes, standard pipe, and wrought iron screw casing. All kinds of fittings. Guaranteed good as new. Write for prices.

**WEISSBAUM PIPE WORKS**, 169 Eleventh St., San Francisco.

**Gasoline Engines**, the largest stock of used gas engines in California from 3 h. p. to 100. Thoroughly overhauled. Machinery Exchange, 783 North Spring St., Los Angeles.

### DUCKS

**White Muscovy Ducklings**, Panama Exposition prize. Week old 35c each. Caldwell Rabbit Farm, 2520 San Fernando Blvd., Los Angeles.

### TURKEYS

**The Ferris Bourbon Red Turkeys**, quickly maturing, non-wanderers. Winners at Panama-Pacific, California and Arizona State Fairs, Los Angeles. Eggs \$3.00 per 12. Mating list. The Ferris Ranch, S. Reservoir, Pomona, California.

HOGE  
BERKSHIRES GUERNSEYS  
—GRAPE WILD FARMS—

At present the oldest boars we have to offer are of September and October farrow. They are by Royal Superbus and Fashion Longfellow 27th. We also have a limited number of gilts to offer, bred for May farrow.

A. B. HUMPHREY,  
Escalon, San Joaquin County, California.

Make Big Money — Pork prices jumping up. Breeding stock scarce. Next winter will see the greatest shortage of hogs and the highest prices ever known. Prepare now by getting some Whitten Ranch Poland-Chinas—the prolific, easy-feeding money-makers. Prices reasonable; satisfaction guaranteed; everything immune. Send for valuable free booklet, "Hogs for Profit." Ranch in Tulare County, but write R. H. Whitten, 519B Marsh-Strong Building, Los Angeles.

Poland-Chinas—Will book a few more orders for May and June delivery, weaning boar pigs out of my best outstanding money-making, easy keeping sows, sired by Model Major, first prize winner at Sacramento State Fair 1916 and sire of the 1917 State Fair grand champion or I. B. A. Wonder reserve grand champion at the Panama Pacific International Exposition at San Francisco. Hale I. Marsh, Modesto, California.

"Billiken" Chester Whites — The Easy Feeding Mellow Type. All bred sows and bred gilts are gone. Have 15 gilts that were farrowed in May, 1917, that will be bred for September farrows. These gilts are all sired by "Billiken." One young service boar that is just 13 months old. C. B. Cunningham, Mills, California.

Registered Poland-Chinas of the medium type. Three sows to farrow their fourth litters in June and two boars, one two years old sired by Panama Chief. The other 3½ years old. Prices very reasonable. Wm. D. Bear, Chalfant, California.

Superba, World's Grand Champion Poland-China boar and one of the greatest sires of the breed. Spring boars ready for service, also few sows bred to this noted sire, reasonably cheap. Rough's Greenfields, Arlington Station, Riverside, Cal.

We Pay Cash for Hogs of All Sizes, weigh's and breeds. Any number from one to several thousand considered. What have you? Durbin & Forbes, 722 San Fernando Building, Broadway 4170, 3030 E. Vernon Ave., South 2712-J, Los Angeles.

For Sale—8 Poland-China pigs, farrowed April 1st, sire of pigs "Long Smooth Jumbo," sire of dam "Superba," both 1000 pound hogs; dam 600 pounds. Bred right to make great hogs. \$15.00 each during May. M. A. Packer, Jefferson Street, Riverside, California

Copro (Made from coconuts)—Best hog-feed. Your dealer, or Lee Chamberlain & Co., Los Angeles, Cal.

Rancho Rubio Ducros—Thirty of the finest fall gilts we ever raised. Will begin breeding May 10. Write for prices and pedigrees. Some splendid weaned boar pigs for \$25.00. Elmer Lamb, Ceres, California.

For Sale—Four half-blood Ducro-Jersey sows, due to have pigs first of June; 1 registered Berkshire sow with 8 pigs; 1 registered Ducro-Jersey boar; 1 registered Berkshire boar. See E. R. Litten, Blythe, California.

Mule Foot Hogs, large type, booking orders for spring litters. These are the farmers' easy feeding, profit producing kind. H. T. Bailey, Box 37, Lodi, California, "The Blue Gums."

Ducro-Jerseys—Sold out. Pigs by the Junior Champion and out of winning sows in May. Frederick M. Johnson, Napa, Cal.

Large Yorkshires—The ideal hog for the progressive farmer. Service boars and fall pigs, both sexes, for sale. A. L. Tubbs Co., Calistoga, Cal.

Large Type Poland-Chinas are prolific and profitable. Can furnish boars any age at reasonable price. J. A. Crawshaw, Hanford, Cal.

Ducro-Jerseys—We breed the champions. Peters, Lamson & Walker, Devore, San Bernardino County, California.

Greenwood Farm Ducros — "Size with Quality." H. C. Witherow, Palo Cedro, Cal.

HEWITT'S BIG TYPE POLAND-CHINA gilts and boar pigs. Hewitt & Hewitt, Dixon, Cal.

Registered Ducros of the big type—Cholera Immune. Derryfield Farm, Odd Fellows Building, Sacramento, Cal.

Carruthers' Farm Berkshire Hogs—Our herd won Premier Exhibitor prize at the P. P. I. E. Exposition, Mayfield, Cal.

Poland-Chinas — A few good breeding boars. S. F. Williams, Orland, Cal.

AGRICULTURAL IMPLEMENTS  
IMPLEMENTS AND RANCH SUPPLIES. Samples and slightly used. Four floors. Large stock. Liberal credit. Save 50 per cent on some. No branches. ARNOTT & COMPANY, INC., The Yellow Front. Established 1892. 112-118 S. Los Angeles St., Los Angeles

AUTOMOBILE ACCESSORIES

Lumber-Bash-Doors-Plumbing - Supplies —Building materials of all kinds. New and second hand \*A.R.W. shingles 60c per bundle. Send list for estimate. Dan P. (Mission Street) Dolan, 1620-1650 Mission Street, San Francisco.

A Matter of Management

Written for California Cultivator By Jean A. Koethen

THE California White Leghorn is the best in the country. Eastern hens don't come within sight of her. She does her best laying in her first and second years, but is frequently profitable through the third and fourth. So says Geo. J. Richardson of East San Gabriel, whose careful handling of 3500 hens has made him an authority on poultry subjects.

"Ask me the questions you want," answered Mr. Richardson, as I caught him in a mad rush from egg-room to incubator cellar, where a big hatch was waiting to be moved to the brooders. "Chickens are a big subject. I could talk all day and not get through." So I asked him first of all the question that is uppermost in the minds of poultry writers and editors, though it doesn't seem to worry successful poultrymen,—"Is the poultry industry going to the bow wows?" Not a bit of it," came the quick reply. "We are not discouraged in the least. We have to work a little harder, maybe, and plan a little closer, but for the man who is well established, owns his own plant and has capital to buy early and in wholesale lots, there can be no such thing as failure. True, some men have had to quit, but they were mostly fellows who hadn't much capital. In some cases they were buying their places on installments and to make the payments on their land and at the same time buy feed at present prices was more than they could carry. If we were buying our feed now it would cost us in the neighborhood of 36 cents to produce a dozen eggs but we bought before prices went so high so we are not worrying."

"But what about Rule 14, prohibiting the selling of laying hens? Has not that worked a hardship in many cases?" Mr. Richardson's eyes twinkled. "Oh, I guess that was all right, after all. They modified the rule a little so that a poultryman who had old hens he was morally certain would not lay could get rid of them. We cull pretty close, and hadn't more than 50 boarders on the place when the order came. We got rid of them readily enough. Any man who knows his hens knows whether they are laying or not. It was just as well to save the layers."

Mr. Richardson's Leghorns begin laying at from 4½ to five months,—many would begin earlier still if he allowed it. "I hold them back," he said, "feeding for size and development rather than for premature production. We aim to get every chick out of the shell before the middle of March. This makes it certain that they will reach laying maturity by October or earlier. As a matter of fact, many do begin to lay in July and August. Some of these early hatched pullets will lay through the summer and then molt in the fall, but our method of handling them is such that even though they do molt they will not drop much in egg production.

"In the first place, we keep the pullets from maturing too early by hopper feeding. Through the spring while they are developing we feed both grain and mash in hoppers, never throw the grain in litter as is so often recommended. The result is, that the pullet, since she has always food before her, and not only mash, but grain, will eat a good deal more grain and a good deal less mash than she would if the mash were before her always and the grain only occasionally. Mash, with its meat content, forces egg production. Grain develops the whole body. And so it happens that only the most vigorous pullets lay in July. The rest are held back till August or September.

"When pullets do molt in the fall, as some of them will, we are able to keep a large per cent laying right through the molt by special feeding. We give all they will eat at all times, then at night when their crops are full of grain, just before they are ready for the roosts, we add to the dry mash and hard grain which has been their ration during the day a half ounce per bird of wet mash. This stuffs their already full crops to the limit, and they simply can't stop laying. Many of our older hens, when

fed in this way, will lay through their molt."

Asked about the per cent of egg production he expected from his hens, Mr. Richardson took out his record book which showed that 903 hens in one house,—hens three, four and five years of age—had for two weeks in April maintained an average of 52½ per cent. During the same period the production of a flock of yearling hens had been 55 per cent; that of a flock of two-year-old hens 59 per cent; while a flock of hens hatched in February, 1917 had reached 64½ per cent. "You can see by these figures," said he, "that it is impossible to lay down any rule as to what ought to be expected. Much depends on the age of your hens and on the proportion of pullets and older hens. A flock of 1000 pullets and 2000 two-year-old hens could not maintain the same per cent of egg production as a flock of 200 pullets and 1000 two-year-old hens. This particular record shows the older hens ahead, but that is because the pullets have laid steadily all winter while the older hens were molting. Now they are lagging behind while the older ones go ahead. In general we don't expect our hens to lay much over 12½ dozen eggs in a year, say 157 to 160 eggs. That would be about 45 per cent for a yearly flock average, but then, as I said, everything depends."

No trapneests are used on the Richardson ranch. Mr. Richardson finds his system of selecting breeders according to early maturity and late molting entirely satisfactory. At the age of about 3½ months the pullets are looked over and those which show the best development are banded. The following summer when as yearling hens they are going through their first regular molt, all early molters among these banded hens are culled out. The remaining banded hens include all that matured early and molted late, and these are kept as breeders. Some attention is paid in culling to length of keel and straightness of pelvic bones, but these tests are used mainly in selecting the breeding cockerels. Length of body is considered especially important. The color test recommended by Eastern experts for selecting the best layers is not considered reliable for California Leghorns because of the intermixture of Minorca blood which tends to lighten the color of the shanks.

The chicks on this interesting plant are brooded in hot water brooders, 110 chicks to each brooder. They are fed a good brand of buttermilk mash till they are 2½ months old. The mash is given every two hours the first week, and after that is kept before them from 9 a. m. to 3 p. m. This compels them to fill their crops with the grain mixture consisting of cracked milo, and hulled barley before they go to sleep. At 2½ months some of the P. C. A. laying mash, which is fed to the laying hens, is mixed with the buttermilk mash, and at 3½ months the pullets are on the laying mash entirely.

The layers, in addition to the laying mash which is kept before them in hoppers, receive a grain ration which is changed from time to time to suit conditions. At present it is a mixture consisting of two sacks whole barley, two sacks oats, six sacks milo. This is supplemented by a daily feeding of barley or oats which has been soaked till the white sprouts begin to show. This is given last thing at night and forms about 35 per cent of the grain ration.

The colony houses used for the young stock on this plant and others in the neighborhood are different from those generally used in other sections. They are built with one side open, except for wire, and a large door in one end, so that when the door is open the air is nearly as pure as that outside. These houses are built of light timber covered with tarred paper and are 8x11½ on the ground (a size which best utilizes the paper) four feet high to the eaves and six feet to the peak. They are designed to accommodate 125 half grown Leghorn chicks.

Washington spring wheat acreage shows ten per cent increase.

FOR  
Irrigation  
Purposes

These pumps are built in various sizes, with capacities ranging from 180 to 4500 gallons per minute. They are designed for installation in wells as small as 10 inches in diameter. Tell us your needs and we will tell you how much it will cost to obtain the desired amount of water with a Layne & Bowler Pump. Ask for Catalog No. 30 when writing.

## Household Department

## ONE LITTLE STAMP

One little Thrift Stamp—  
 Stuck on with glue—  
 Felt very lonesome—  
 But soon there were two:  
 Two little Thrift Stamps—  
 Were lonely no more—  
 For along came a couple—  
 And then there were four:  
 Four little Thrift Stamps—  
 Had not long to wait—  
 Till four more were added—  
 And then there were eight:  
 Eight little Thrift Stamps—  
 Were happier when—  
 Two more enlisted—  
 For then there were ten:  
 Ten little Thrift Stamps—  
 Didn't look so mean—  
 But looked a lot better—  
 When they numbered sixteen:  
 Sixteen little Thrift Stamps—  
 Happy as can be—  
 Singing—"We'll be worth five dollars  
 In nineteen twenty-three."

## "CHEER UP" LETTERS

**W**E DON'T believe Cultivator readers need any of the tonic administered in the following letter, but we all like to read the opinions of others who agree with us. This letter was written by D. A. Webster of the Beaver County News, Milford, Utah. Mr. Webster was formerly editor of the Santa Paula Chronicle, published in our California county of Ventura: "The other day I met the chairman of the Woman's Division of the Public Information Committee, Clara Sears Taylor, and she said, 'Do you know that one of the serious menaces to the morale of our boys here and in France is the tenor of their home letters?' "Probably I looked skeptical as well as shocked, for she went on to say that this assurance had come to her from very high military authority, and that it was her purpose to send out a bulletin urging women to keep up their courage, and she suggested that we do the same, so as Hasimuro Toga would put it, 'Here are bulletin of cheer-up.' "

"It is not enough to keep the home fire burning; if you find yourself growing weepy add another chorus of your own which might go in this fashion:

"Keep your letters cheerful,  
 Do not make them tearful;  
 Sad heart never helped a man to win a fight;  
 Tell them in full measure  
 What will give them pleasure,  
 Write with hope and pride and keep  
 your letters bright."

"It is really inconsistent for us to expect our soldiers to pack up their troubles in their new kit bags and smile, smile, smile, while we wipe our weeping eyes and stifle our groans against their new uniforms. What they have to face is bad enough, and what the women have to bear, who let them go, is not to be set down in words, and we would do anything that would help them, anything. But the first, most obvious thing to do is to keep up our own courage, and so theirs."

"Writing may not come easy and

humorous writing is a gift few possess, but if anything funny has happened, that would bring a smile, anything that Son can read to Brother and provoke a laugh, put it into the soldier's letter. There are certain items that belong in all these letters. If there is bad news don't work up to it. Tell him how the family is, what it is doing, and then be sure to tell him that the service flag is the proudest possession of the family, and the center around which everything circles. Tell him something about every member of the family, not omitting the dog, and anything interesting about the neighborhood. There are times when gossip is a duty. It need not be ill-natured.

"It is said that the perfect short story should move the reader to laughter, bring him close to tears, and have in it a touch of the inexplicable, the supernatural. The grief element is close enough all over the world just now. Anyone who has seen Bairnsfather's inimitable cartoons knows that laughter is still possible even when horror seems to have everything in the hollow of its hand.

"Moreover, it is possible to be religious without being mournful over it.

"There is no reason why we should let the kaiser have a monopoly when it comes to thanking God for victories, because in the end we are going to win, and autocracy and all that the kaiser stands for are going into limbo of the eternally lost. There is nothing in the world so absolutely certain as that, for

"Right is right, since God is God,  
 And right is sure to win.  
 To doubt would be disloyalty,  
 To falter would be a sin."

"That isn't such a bad verse to send your soldier lad. That is militant Christianity, and that has to precede the triumphant finish.

"Then there is one other element that I try to put into the letter going 'over there.' If the Hun ever gets one of those letters it would be full of cold discomfort for him. It ought to tell him that crops are good, the Liberty Loan oversubscribed, the new quota of recruits getting into training by the tens of thousands and the men already trained getting to the front about ten times as fast as we thought possible a year ago. 'They may bend, they may break the west line if the will, but nothing on earth can save Kaiser Bill. Every letter should be a nerve tonic for our boys and a heart depressant if it falls into the enemy's hands.

"If you are blue remember General Foch. He had had some cause to be just a bit worried at the Battle of the Marne, and when things were at their worst he sent this wire to General Joffre: 'My right is retreating; my center is breaking; my left is giving way; I shall attack.' So he attacked. All the world knows the result."

**COOK WITH PEARL OIL**

A New Perfection Oil Cook Stove means kitchen comfort and convenience. Ask your friend who has one. Used in 3,000,000 homes. Inexpensive, easy to operate. See them at your dealer's today.

## Your kitchen cool as the seashore

Even on the hot summer days you can keep your kitchen comfortably cool by using a New Perfection Oil Cook Stove. No dirt or dust; no smoke or odor. Economical.

Lights at the touch of a match and heats in a jiffy. Easy to operate and more convenient than coal or wood. Bakes, broils, roasts, toasts,—all the year round.

In 1, 2, 3 and 4 burner sizes, with or without ovens or cabinets. Ask your dealer.

**STANDARD OIL COMPANY**  
(California)

## NEW PERFECTION OIL COOK STOVE

## Scenes of Prosperity

are common in Western Canada. The thousands of U.S. farmers who have accepted Canada's generous offer to settle on homesteads or buy farm land in her provinces have been well repaid by bountiful crops of wheat and other grains.

Where you can buy good farm land at \$15. to \$30. per acre—get \$2. a bushel for wheat and raise 20 to 45 bushels to the acre you are bound to make money—that's what you can do in Western Canada.

In the provinces of Manitoba, Saskatchewan or Alberta you can get a

**Homestead of 160 Acres Free**  
and other land at very low prices.

During many years Canadian wheat fields have averaged 20 bushels to the acre—many yields as high as 45 bushels to the acre. Wonderful crops also of Oats, Barley and Flax. Mixed Farming is as profitable an industry as grain raising. Good schools, churches, markets convenient, climate excellent. Write for literature and particulars as to reduced railway rates to Supt. of Immigration, Ottawa, Can., or to

Manufacturers

**KELLOGG'S ANT PASTE**

**MAKES ANTS DISAPPEAR**  
**A MAGIC PREPARATION**  
**25¢ AT ALL DRUGGISTS**

### CABBAGES AND OTHER THINGS

Cabbage is often improperly cooked. It does not require long cooking—25 to 35 minutes is sufficient time to allow for the fresh cabbage, although the winter cabbage usually requires longer. Cook it in boiling salted water, to which a small amount of baking soda—an eighth of a level teaspoon to a large head of cabbage—is added. Don't throw away the outside leaves; if shredded they can be cooked and used. Serve buttered or with cream sauce, or sometimes for a change serve with cheese (au gratin). Cabbage, cauliflower or celery are all good served this way.

#### Cauliflower with Cheese

Remove leaves, cut off stalk, and soak 30 minutes (head down) in cold

water to cover. Cook (head up) 20 minutes or until soft in boiling, salted water. Drain and place the whole cooked cauliflower, or separated flowerets, on a dish for serving. Sprinkle with grated cheese, cover with buttered victory bread crumbs, and place on oven grate to brown crumbs; remove from oven and pour one cup white sauce around the cauliflower.

Steaming the vegetables instead of boiling them in water saves the valuable mineral matter that is often drained off with the water in which the vegetables are cooked. Some strong flavored vegetables, such as cabbage or onions, require cooking in a large amount of water to make the flavor milder, but carrots and such sweet juiced vegetables are better steamed or cooked in a little water as possible.

## The Cultivator Patterns

8779—Ladies' Dressing Sacque. Cut in sizes 34, 36, 38, 40, 42 and 44 inches bust measure. The blouse has a deep tuck at each side of the front coming from the shoulder seams.

8802—Girls' Dress. Cut in sizes 6, 8, 10, 12 and 14 years. The straight waist is in Empire effect, with the waist line cut higher in front.

8556—Ladies' One Piece Dress. Cut in sizes 36, 38, 40 and 42 inches bust measure. The dress hangs in a straight line from shoulder to hem, and the plaits come from the shoulder seams.

8777—Ladies' Dress. Cut in sizes 36, 38, 40 and 42 inches bust measure. The shoulder edges of the back of the waist extend over in yoke effect; the skirt is two gored.

8543—Ladies' Waist. Cut in sizes 34, 36, 38, 40, 42 and 44 inches bust measure. The back extends over the shoulders and the fronts are gathered to the edges to give the effect of a shawl yoke.

8531—Girls' Long Waisted Dress. Cut in sizes 6, 8, 10 and 12 years. The dress is in long waisted effect, having a perfectly plain waist which buttons at the back.

8544—Ladies' Four Gored Skirt. Cut in sizes 24, 26, 28, 30 and 32 inches waist measure. The four gored skirt is gathered all around to the slightly raised waistline.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

### HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

PATTERN DEPARTMENT  
California Cultivator  
Los Angeles

Often onions are overlooked, except in the capacity of seasoning, yet they are a delicious vegetable.

### Scalloped Onion

Peel and slice large onions in one-fourth inch slices and boil until tender. Fill pan with layers of onion and victory bread crumbs, add salt, pepper and butter. Cover with one cup white sauce and sprinkle with buttered crumbs, place on grate in oven to brown crumbs.

Note: One cup of chopped, cooked ham or other meat may be added.

### COOKING THE PINTO BEANS

Many California bean growers are this year planting pinto beans. Consequently it's up to us women to know how to cook them. From Colorado, the home of the pinto, we have received these instructions for Cultivator readers. They are written by Evelyn Jones of the Colorado agricultural college at Fort Collins.

### Cooking the Pinto Bean

The results of comparative cooking tests applied to a year-old crop of Pinto, navy and lima beans are of interest. In these preliminary cooking tests it was found that if the Pinto beans were cooked in the water in which they had been soaked over night—the finished product was darker and of a stronger flavor. To some persons this proved to be a desirable characteristic. It should be added that the darker color resulting from the cooking is not in the least objectionable.

After soaking for 12 hours it was found that the time required for boiling until tender enough to mash easily when pressed between the finger tips was as follows: Pinto beans two hours; navy beans, three hours; lima beans, one and one-half hours.

### Pinto Bean Muffins

Two eggs, well beaten, one cup cold boiled bean pulp, one-half cup milk, one-third cup melted fat, one teaspoon salt, two cups flour (barley), two teaspoons baking powder.

Combine ingredients in order given. Bake muffins in greased muffin pans for 20 or 25 minutes.

Served with a brown gravy, these may be used as a main supper dish. If served as a bread the addition of a tablespoon of molasses is desirable.

### Pinto Bean Loaf

One pint cold beans, one egg, beaten, one cup bread crumbs, two tablespoons tomato catsup, two teaspoons salt, one or two tablespoons finely minced onion.

Combine ingredients, shape into a loaf and bake for 25 minutes. A little fat should be placed on the top of the loaf. Baste with fat and water. Serve with tomato sauce.

Other very satisfactory variations are as follows:

1. Combine with two cups of beans, two cups of grated cream cheese or cottage cheese, and one cup of bread crumbs.

2. Combine two parts of beans, one of cooked rice, cornmeal or oatmeal. Pimientos or finely shredded green peppers may be added to either of the three types of bean loaf, allowing from one to two tablespoons. The addition of beaten egg will help to better hold the bean loaf together. A tomato sauce is an especially acceptable addition to the bean loaf.

### HOUSEHOLD QUERIES

#### Rose Pillows

How do you cure rose petals with oil and spices for use in pillows?—Subscriber, Los Angeles.

The usual method of preparing rose petals for pillows is simply to dry them; the roses, especially the more fragrant varieties such as La France and practically all red roses, retain quite sufficient perfume after they are dried. It is not necessary to fix the perfume with oils or add attar of rose or spices as is done in making pot-pourri for rose jars. You will find it more satisfactory in drying the rose petals to spread them out in shade or partial shade than to leave them in the sun. Drying in the house is perfectly satisfactory. The petals dried in this way retain their fragrance for years.

Can any of our subscribers give formula for making pot-pourri of rose petals for rose jar? Surely some of us have our grandmother's recipe put away.

## Immediate Service on Piston Rings

When you want new piston rings, you want them at once. You can't afford to let your power machinery stand idle, or your automobile torn down, waiting for a set of rings to be made. That's when you need the prompt service given everywhere on

**McQUAY-NORRIS**

**LEAK-PROOF PISTON RINGS**

All over the country we've placed complete assortments of all standard sizes. Your nearest dealer can get them for you quickly through his jobber or supply house. If the condition of the grooves or the cylinders requires oversize rings, we have over 2000 unusual sizes and over-sizes—all widths and diameters—on hand at the factory

ready for immediate shipment anywhere. McQuay-Norris Leak-Proof Piston Rings are the best and promptest answer when any power or carbon trouble develops due to faulty or worn piston rings. They save fuel and oil—reduce motor wear. Give better service and will outlast any other make of piston ring.

SEND FOR FREE BOOKLET—"To Have and to Hold Power"—a simple, clear explanation of piston rings, their construction and operation.

RICE	
By agreement between the growers and millers of rice and the food administration, prices for California rice have been fixed as follows: Paddy rice, \$4.10 per 100 pounds to the growers; cleaned rice, \$7.10 per 100 pounds from the mills to the trade, and \$8.00 per 100 from jobbers and wholesalers to the retailers.	

HAY	
Under date of May 11, Scott, Magner & Miller says:	

Receipts past week, 774 tons. The dry weather has had its effect on crops. It now looks as though instead of a large crop of hay as predicted a few weeks ago the crop will be light, especially in some of the main hay sections. Whether or not this will be overcome by the cutting of hay in other sections that usually cut for grain remains to be determined. The entire situation, in our opinion, depends upon weather conditions during the next two weeks. Considerable new first cutting alfalfa is being offered but owing to the high range of prices very little, if any, is changing hands and none has been received on this market up to date. From the present outlook the quality of the new crop will grade considerably lower than the crop of last season.

Boston: 9 cars. Nav. 5.80, Val. 3.25-6.30, Mikes 4.75-5.15, lem. 3.50-5.05.	

TRUCK CROP MARKET, CONDITIONS	
Herewith extracts from the weekly summary of the Los Angeles branch of the Bureau of Markets as to general conditions and shipments of onions, potatoes, cabbage and strawberries. Issued at Los Angeles Tuesday p. m.	

Old potatoes continue weak. Most northern shipping sections show steady to firm tone, although many consuming markets quote lower ranges for old stock. Potatoes suitable for shipment seem likely to be cleaned up fairly well in Eastern and Northwestern producing sections and the region of the Great Lakes is reported as having considerable stock yet on hand. Large amounts have been used in the East for starch manufacture and in the Northwest for evaporating and manufacture of various potato products. Shipments of old potatoes have again declined to 1628 cars, compared with 2111 last week and 2889 the preceding week. The volume of new potatoes was 372 cars, against 968 last week and 501 the week before. Old stock sold to shipping trade in Northern and Eastern markets ten to 15 cents lower and was also weak in Central markets at \$1.15 to \$1.40. Colorado White stock in Southern and Southwestern markets declined ten cents, ranging \$1.40 to \$1.85. The week closed with tone of distributing centers for both old and new stock showing fairly steady decline. The government campaign for increasing the demand apparently is improving movement in some cities. Supplies of old and new stock have been coming in at the rate of 300 to 400 cars per day. Shipments of new potatoes have averaged nearly 150 cars per day, or fully one-half the volume of old stock and greater than the volume of old stock coming at the corresponding week last year. The combined volume of old and new stock shipments was 2500 cars. Sale of new potatoes to jobbers declined sharply in price and most markets closed weak at a general range of \$3.00 to \$3.75 per barrel for Florida and Spaulding Rose.

Onions

Range of prices for old stock held fairly steady, \$1.00 to \$1.50 per hundred for jobbing sales in Eastern and Northwestern markets. Prices of new onions continued weaker at Texas shipping points at 35 cents to \$1.15 per crate for No. 1 and No. 2 Yellow. No. 2 White declined to \$1.29. Movement of new onions recovered sharply to 507 cars, compared with last week when Texas shipped 421 and California 70. Movement

of old stuff seemed to decline, only 17 cars starting last week.

Cabbage

The volume of cabbage shipments continued heavy with total of 320 cars for the week, South Carolina still leading, with Alabama and Mississippi sections showing marked increase. Total shipment of old cabbage for the 1917-18 season to May 10 from nine states or shipping sections was 21,120 cars. Available figures indicate cars more heavily loaded than during previous seasons. Prices for new cabbage at shipping points in South Carolina declined 25 to 50 cents per barrel crate over last week. New York and several other markets were over-supplied, including much inferior stuff selling at very low prices.

Strawberries

Movement of strawberries continued active in consuming markets and prices are very well sustained considering the time of the year. The range varied greatly from day to day, generally 15 to 30 cents per quart basis for good North Carolina stock in Eastern markets. The South Carolina season is nearly over; growers are paid \$4.00 to \$7.50 per 32 quarts, the market declining to \$6.50 at close of the week. About one-half of these came from Tennessee. Strawberry movement so far this year has been not much over two-thirds of last season to corresponding date.

Shipments

From post card reports to the bureau of markets, United States department of agriculture, Miss Hoey makes report of the following shipment of cars of products from California for the week ending May 13: Apples, 12; artichokes, 9; asparagus, 7; bananas, 1; beans, 49; cabbage, 54; carrots, 3; cauliflower, 1; cherries, 2; cucumber, 1; dried apples, 3; dried apricots, 1; dried peaches, 12; dried prunes, 14; fresh peas, 2; lettuce, 46; Mexican tomatoes into state, 17; mixed fruit, 6; mixed vegetables, 73; mixed fruit and vegetables, 5; mixed dried fruit, 3; onions, 56; potatoes, 39; raisins, 26; rhubarb, 2; strawberries, 21; spinach, 273; tomatoes, 1; turnips, 2.

The spinach shipments which indicate large volume of business cover period during April and all of May and are largely from Sacramento sections to canners.

SPRING INVASION OF ANT PEST

The spring invasion of the aggravating ant pest has begun, and the housewife is complaining of the nuisance. In former years they seemed to accept the ant pest as an evil that could not be overcome, and as a result they threw away much foodstuff. Now, however, with the great cry for food conservation, they demand a means for ridding their houses of the insects.

All readers who are troubled with these bothersome insects should go to the nearest drug store and ask for a jar of Kellogg's Ant Paste. Take a match or stick and spread a little on the trail of the ants. Fortunately the ants do not die as soon as they eat the paste but

quickly disappear. As a rule every ant is gone within a few hours. If the ants reappear a second application will make them vanish.

## DEDICATION

**I**T is for us, the living, rather, to be dedicated here to the unfinished work which they who fought here have thus far so nobly advanced. It is rather for us to be here dedicated to the great task remaining before us---that from these honored dead we take increased devotion to that cause for which they gave the last full measure of devotion---that we here highly resolve that these dead shall not have died in vain---that this nation, under God, shall have a new birth of freedom---and that government of the people, by the people, for the people, shall not perish from the earth.

—Abraham Lincoln

## Wagons That Stand Up

**B**EAR this point in mind the next time you buy a wagon—Columbus and Weber wagons are guaranteed to stand up under capacity loads. You don't have to be a wagon expert to buy a Columbus or Weber wagon safely. All you really need to know is the weight of your heaviest loads. Buy a wagon marked to carry that load and we guarantee safety and satisfaction worth more to you than all the talking points of all the wagons in the market put together.

Ask any dealer who carries Columbus or Weber wagons to show you just what we mean by this statement, or write to us for full information. Our wagons have many good features—the International fifth wheel, the sandboard wear plate, link end rods, folding end gate, superior material—more features than you will find on any other wagon. All these help to give the good service, long life and economy that you get with Columbus or Weber wagons. See the wagon or write to us before you buy again.

Truck Built for Country Roads

## PATRIOT FARM TRUCK

**Built for Country Roads—Built for Country Loads**

There is real need for motor trucks on the farm—to speed up transportation—

Or—they have been mere cheap units to combine with worn-out, low-priced,

To bring better markets nearer—

To master bad roads—

To save high-priced horses—

But—the farmers have not bought them to any great extent. Why? The reason is, there has never before been a real Farm Motor Truck on the market.

Those that have been sold were built for the paved streets of the cities—not the soft roads and fields of the country.

**The Patriot Is the First Motor Truck Built for Farm Work**

low-powered cars—forming makeshift trucks that never were expected to deliver real farm service.

But now—the farmer has a real truck—built in the center of

Agricultural America—by experienced truck and body makers, in a new, complete and modern factory—and built for farm service.

Every farmer with 160 acres or more should find out what a Patriot Farm Truck will save. Write for information.

**Look!**  
Before You Buy a Tractor

—See what **Bean TrackPULL**

**Tractor Does** Down Between the Rows and Around the Trees!

Note the practical turning feature of this remarkable tractor. Watch it pull the tools around turns just as easily as on the straight-away. See it go all around a tree, with the tools sunk down deep doing valuable work, plowing or cultivating right up to the trunk. Look at the circular diagram above. Do you know another tractor that will do that? Many tractors will turn themselves around all right but the tractor you need whether in orchard, vineyard or FIELD WORK must take the tools around too and keep them at work all the way around. This requires full power on the turns. A pivot-turn with half power isn't sufficient; and a pivot-turn with one wheel or track stationary and full power thrown on one side of the tractor is a straining overload.

That's where the great PATENTED SINGLE-TRACK FRONT-DRIVE principle of the Bean TrackPULL Tractor gets its immense value. It permits full power even when turning inside a 10-foot circle (5-foot radius). No pivoting, and no overload on any part. No other tractor can be built like the Bean, because basic patents protect it from imitation.

Don't buy a tractor that doesn't turn with full power. Your work calls for many turns and a tractor that will make them right will save you time and money.

Send right now for the Bean catalog with full details, learn the price of this remarkable tractor, and the name of the nearest agent who will give you a true demonstration of the TrackPULL doing the kind of work you have waiting for it on your place. Mail us this coupon now, before you forget it.

## The Fair as an Educator

California Will Hold State, District and County Fairs, Which Will Mean More and Better Products

**I**T REQUIRES many forces to educate us or enthrall us: or bring us into line to perform a duty which should be self evident and in fact is self evident to a majority. In olden times every political campaign called for torch light processions and other similar "educators." We find it necessary to conserve food. One statement showing the world's need should be sufficient, but hundreds of thousands of dollars are expended for printed matter; experts and speakers cover the country and make appeal to all to do their simple duty. Still there are slackers, or, at least, as one has expressed it, those who are so sluggish in their perception of the needs of the times that fines and even imprisonment are found necessary because of unpatriotic attitude. The government sees the need for three billions of dollars, and, again, a great campaign is necessary. Agricultural production must be increased; more printed matter, more urging on the part of gifted speakers, exhibits of products at fairs and expositions, all seem necessary to impress the one truth.

Some of us regret this waste of effort; the waste of printed matter, and waste of valuable time. To us the one simple statement might have been all that was necessary, and it should be, but in the aggregate it is not. To many, we regret to say, the war is merely an incident and it is not given enough serious thought. Again, to others, it dominates all and is looked at with such seriousness that every

their county agents, experts from the department and from many state and other organizations, state and district fairs, and, if we may be pardoned we believe we may safely add, to a very great extent farm papers of the land are uniting in working with the farmer. Some farmers have felt that they are being "worked instead of worked in cooperation with. Perhaps. There are a bunch of us that are more or

grew into street fairs which took on the nature of a trade mart where people brought their wares to trade or sell and after disposing of their goods joined in the general festivities, chatted with their neighbors from far and near and went home feeling that the day had been well spent.

"Street fairs grew into county fairs, then into state fairs, these last named dignified by state aid and controlled

industrial congress, farmer's congress and unions, have worked together to the advancement of agriculture."

California's state fair last fall was one of its greatest. Nearly every county and district fair in the state was held. One which was planned to be held last year, but was finally called off because of war activities, was that in Los Angeles which had been planned to be held on the old sixth district agricultural fair grounds, Los Angeles. These grounds, the property of the state, had been utilized as a permanent exposition, with magnificent building in which is maintained an exhibit showing the resources of the state.

At the time of the calling off of last year's date, it was resolved that should conditions warrant a fair would be held in 1918. The conditions warrant, and the management now hears the call of patriotic duty and has planned for one of the state's largest exhibits. The date chosen, October 12 to 26, will make this one of the latest fairs to be held this year.

On the other hand, one of the earliest to be held is the state fair, to be held at the state fair grounds at Sacramento, August 31 to September 8. Excepting the exposition year intermission this fair has been held every year since—almost—the birth of the state.

Investigations started by the department of agriculture in 1910 developed the fact that there were over 1200 county fair associations in the United States. The registered membership of these associations is approximately 250,000, the total gate receipts, \$6,500,000. Nearly all are encouraged by state and county ap-

less restive under some of the flag waving "patriotic" side-stepping sometimes manifested. Still the great mass of us are fighting together. If it isn't our way, well and good, we are still fighting.

We believe one of the greatest of these educational movements is the agricultural fair. We mean the display of truly agricultural accomplishment. Touching upon its educational value, with a bit of history of the agricultural fair, a writer has said:

"Fairs are not new, but they hold entirely new features from old or ancient days. As known to the Egyptians, fairs were gala days for the

by state authorities. Cheap side shows and betting fakirs were gradually driven out, higher class attractions took their places, and educational exhibits from agricultural colleges, experiment stations and other sources formed a small part of the exhibitions.

"Agricultural education from various sources has grown in popularity until today educational features form the main item of fairs and are the axis of activity around which the old time entertainments revolve as remnants. Fair directors realize that the old adage, "All work and no play, makes Jack a dull boy," also Jill, a

Planning for a Liberty Fair

Secretary and Manager F. B. Davison (with overcoat) of the California Liberty Fair Association discussing with H. L. Musser regarding ground breaking for the Liberty Fair garden. Mr. Davison is a livestock fair and exposition man who has spent his life at that work. Mr. Musser is the committeeman in charge of the gardens which will be a feature at the fair, and in addition will distribute hundreds of thousands or possibly millions of plants to home and school gardeners. The building in the background is the permanent exposition building now on the grounds in Los Angeles.

movement which does not tend toward the serious and direct prosecution of the war appeals as an unpatriotic act. While the true patriotic view must be that every act of every true American must tend to a successful conclusion of this war, we may sometimes differ as to the steps required.

Farmers Clubs, farm bureaus with

upper classes, where racing, wrestling, and other feats of strength, held the center of the out-door stage. The amusement of the multitude seemed to be the whole purpose of these ancient festive gatherings, and to the extent they attained this object they were a success.

"In time these out door carnivals

Proud of Themselves

At the State Fair some two or three years ago. There are still some fine drafters in California.

dull girl, is as true today as in the olden times. But the entertainment is of a class fitting an educational institution and the term fair is not so frequently used as a screen to hide gambling establishments and fakir resorts as has been done in comparatively recent times.

"All these agencies for agricultural development fairs, agricultural colleges and experiment stations, government farm demonstration work, boys and girls corn and canning clubs,

propriations. The annual premiums offered aggregate \$2,500,000. State fairs do not show so great an aggregate though their average is vastly greater in gate receipts and in funds paid for premiums.

The department of agriculture has issued statement in which the great fundamental need of increased production calls for the continuance of legitimate county, district and state fairs. Nearly every one of California's fairs will be held this year.

### QUICK AND ECONOMICAL TRANSPORTATION

## Nash Trucks Replace Farm Teams

Farmers are finding that high grade trucks such as the Nash not only speed up hauling but reduce its cost. Replacing teams, Nash trucks are a real economy in farm service.

They cut in half the time to town and back. They carry bigger loads each way. They do not require rest between trips. They let you leave home later and get back earlier, giving you more time for work on the farm.

Nash trucks are especially fitted to farm work because they are equipped with M. & S. automatic locking differentials. The Nash truck's driving wheels cannot spin. This saves fuel and tires. It lets Nash trucks get through where other trucks without this important feature cannot go.

An unusual strong internal gear drive rear axle, which is not only lighter but much simpler than others and which delivers a greater amount of power to the truck's driving wheels, especially at low engine speeds, is one of the many other Nash truck features about which our transportation expert will be glad to tell you in detail.

## Pollination and Fertilization of the Olive Blossom

By I. Hawley, in Fig and Olive Journal

**P**OLLINATION should not be confounded with the fertilization of the flower; the former is purely a mechanical process developed by the tree to carry the pollen grain from the anther of the male organ to the stigma of the female organ. The olive depends essentially upon the wind to secure pollination. That this is so we are led to believe principally, by the fact that the tree produces an enormous quantity of pollen, which is a characteristic of all wind-pollinated trees. Secondly, the flower is not so constructed that insects working on it are forced to deposit the pollen grain on the stigma, except as may be noted later. Thirdly, the flower produces, practically speaking, no nectar or odor by which to attract pollen-carrying insects.

This does not necessarily mean that pollination may not be affected by insects. Bees, for instance, may be observed working on the flowers, but apparently their only reason for doing so is to collect the highly nutritious pollen grain for food, and in so doing they hover from flower to flower and do not deposit the pollen grains on the stigma, as they are forced to do in flowers of many other fruits, into which they must crawl to collect the nectar. If this observation be correct, the inference is that a large number of bees working in an olive grove might conceivably prevent pollination in some measure because of the collection of a large quantity of pollen. The foregoing statement is made more with the thought in view of pointing out probable results to those who may think it necessary to provide an apiary in the vicinity of their groves to promote pollination.

#### Effect of Thrips

It has occurred to the writer that the operation of thrips in an olive grove may, in a degree, assist pollination. These small and active insects may generally be found working inside the flowers and if they are examined under a magnifying glass their bodies will be seen to be literally covered with pollen, part of which, in their movements from flower to flower, is deposited on the stigma. These insects, however, are known to do considerable damage when working on flowers of other fruits, and a certain species of thrips is reported to have injured olive trees in Italy. This is one of the phases of olive growing about which we are in need of greater knowledge and that is the reason why it is here mentioned. If the thrips do more harm than good we want to know it so we may take steps to control their pernicious activity.

#### Climatic Influences

It may be stated in passing that while fruit produced on the tops of the trees is of a superior quality the quantity is less than that grown on the lower branches. While there are no doubt other causes which may contribute to this result, inadequate pollination may be a factor in bringing about this condition, since the pollen at the top of the tree falls, or, if there be winds, is probably carried away to the lower branches of adjoining trees, or is wasted.

Climatic conditions which adversely affect pollination are rains, frost, excessive heat and strong winds. Of these causes rain is by far the most detrimental, only occasional damage being done by the others. A heavy rain occurring while the trees are in full flower not only washes the pollen from the anthers but may also devitalize the pollen grains in the flowers that are open at this time. These devitalized grains are, of course, rendered useless for the fertilizing process. While losses from these causes are, naturally, beyond the control of the grower, nevertheless it would be advisable to make note of such occurrences and record the results so that we may determine more definitely in the future the percentage of loss from this cause, as well as losses occurring at later periods of the season from frosts.

#### Fertilization

Fertilization is the process by which

the pollen grain finds its way into the ovule of the female flower, where the nuclei unites with the female egg cell and forms the nucleus which eventually becomes the embryo of the seed.

The main interest which this subject holds for olive growers lies in the possibility of determining whether or not production can be increased by cross-fertilization. Generally speaking, our two principal pickling varieties of olives, the Mission and Manzanillo, may be said to be self-fertile, that is to say, that the pollen from an individual tree will fertilize the female flower on the same tree. At least, the preponderance of evidence and certain experiments seem to lead to this conclusion. In many locations isolated groves of either of these varieties do set crops in a fairly satisfactory manner and the same may be said of individual trees. Experiments in bagging individual or a number of twigs during the blooming period also demonstrate that these varieties are self-fertile. This does not imply, however, that cross-fertilization would not be beneficial.

We know this is so with some other fruits and there appears to be some evidence that it may be true of the olive. The writer, in talking with other growers, has, in a number of instances, found individuals who believe that certain trees of a particular variety that surrounded a tree of a different variety produced more fruit than did other trees not so situated. And the writer has also noticed this in a superficial way in his own work. However, detailed information on this point is not available at this time, or until further observations by a number of growers confirm the indications noted.

#### Suggested Experiments

A simple method and one easily practiced by the grower who wishes to ascertain the possible effects of cross-fertilization, is to carefully cut off a branch from different varieties of trees and shake the pollen on a particular branch of another variety, which he should mark for future comparison with other branches of the tree.

Another plan is to "bag" individual twigs just before the flowers open to demonstrate the sterility of the flowers to their own pollen and thereby prove the advantage of cross-pollination from either trees of the same variety or trees of a different variety.

#### New Varieties

We all realize the desirability of developing a new variety of olive that would possess the fine qualities of the Mission but at the same time give us a larger and earlier maturing fruit. This we can never hope to accomplish entirely for the reason that all experience goes to prove that very early ripening fruits are lacking in that quality of texture which makes for the best results in canning, as observe the early peach, apple, etc. Late ripening fruits are always found vastly more suitable for preserving purposes and the olive is essentially a canning proposition.

Progress in the propagation of new and desired species of olives is hardly to be expected, however, while the experimental work falls upon the individual grower, who cannot give the time and labor to an undertaking that promises no early or direct return in the way of profits. Rather this work should be assumed by the agricultural college and carried on for the benefit of the olive industry. This individual grower may help himself, though, by strongly recommending this activity to the university.

#### Setting of the Fruit

A most important point in connection with the setting of the olives is whether irrigation during the blooming period is beneficial or not. Of course, this will depend upon other factors such as the quantity of soil moisture present, the flow of sap as influenced by the prevailing climatic conditions, and the like.

As a recommendation it might be suggested that where convenient a portion of the grove be irrigated while

the trees are in bloom, and the remainder allowed to stand over without irrigation until the fruit has set. In view of the fact that at present we have no agency to make such experiments as described it is up to the olive grower to do this for his own information and benefit.

It is a commonly accepted theory, and one supported by observation that an excessive flow of sap at this period tends to cause a profuse dropping of the setting fruit. The point suggests itself here that irrigation or non-irrigation at this time might be utilized in controlling the flow of sap to our benefit. For this reason it would appear to be worth the grower's while to conduct the experiment advised.

The writer feels that all this subject matter deals with points which may appear on the surface to be of little practical interest to the olive grower, but, recalling that all knowledge is the result of experiment, it is hoped that the investigations suggested may, in their turn, prove of some value.

### CLAREMONT POMOLOGICAL

One of the oldest and most successful farmers' clubs in California is the Claremont Pomological Club organized a score of years ago. It has grown until there is often a waiting list for membership. It holds nine sessions each year, sometimes as a picnic, more often as a genuine home dinner in the homes of its members. As each home entertains only about one in three years the one entertainment is made a great event. It meets not only in the homes within a short distance of Claremont, but at Riverside and other places at some distance. The meeting this May will be held in Los Angeles next Saturday at the home of V. V. Leroy, who has for years been secretary of the association.

On Saturday, May 25, forenoon session will begin at 10 o'clock, a noon dinner will be served, and at its finish the company will convene for the afternoon session.

For several meetings Dr. H. J. Webber of the citrus experiment station at Riverside has been delivering a series of addresses on plant breeding. Dr. Webber will be at the Saturday meeting and continue this series.

Dr. J. Eliot Coit, farm adviser for Los Angeles County, will deliver an address on June drop of oranges. Dr. Coit has made investigation of this trouble during several years.

Prof. C. B. Lipman of the University of California will speak on Modern Views on Soil as a Medium of Plant Growth.

J. D. Culbertson of Limoneira Lemon Orchards of Ventura County will discuss Lemon Culture.

C. S. Chapman will deliver address, presumably on Valencia.

Prof. Alfred Cookman of the botany department of Long Beach High School will give Economic Value of Birds to the Rancher of California.

To lighten up the program and jolly the bunch Rae Condit will whistle and turn loose some of his vaudeville stunts.

### FOR THE ORANGE APHIS

For some unknown reason the various parasites which usually keep down the orange aphis appear to be on a vacation. Meanwhile the aphis has increased until serious damage has been done in many groves. No one can foresee just when the parasites will appear and clean up the aphis. Those wishing to take the matter into their own hands should spray the trees with the following solution:

Black-leaf 40 ..... 1/2 ounce  
Soap ..... 4 ounces  
Water ..... 4 gallons

Dissolve the soap in hot or boiling water; add the "black-leaf 40" and boil for a few minutes, after which add enough water to make four gallons of prepared spray.—Los Angeles Farm Bureau Monthly.

### LEMÓN GROWERS' DIFFICULTIES

Italian lemon growers, faced by the transportation impasse, have been forced to turn their fruit over to the by-products factories for manufacture into citrate of lime and lemon essence. The supply of these articles is therefore larger than usual and market disposal still looms as a problem.

## Standardization Conference

**S**TATE Commissioner Hecke recently called shippers, growers and horticultural officers together at Sacramento to discuss the standardization law and best rules to adopt to secure its enforcement. The commissioner presented the matter to the county commissioners present and urged necessity of uniform enforcement of the provisions of the law. The various fruits covered by the law were taken in turn and, so far as definite rulings were made, we give them from the minutes of Secretary Fessenden.

### Cherries

There was some discussion as to the term "well colored" in regard to cherries. It was the general opinion that Black Tartarians should be a mahogany color for shipment and from mahogany to black for local sale.

As to the term "practically uniform size" it was ruled that one-eighth inch variation in size be the extreme limit allowed.

In "practically uniform maturity" the color was taken as indication of maturity, and cherries that were uniformly "well colored" were to be considered of "practically uniform maturity."

### Peaches

The term "practically free from in-

sects and fungous diseases" was first considered and a high standard of cleanness was advocated. A limit of not over three per cent of any one defect and ten per cent total defects should be allowed.

The maturity of peaches is a difficult problem and the suggestion given by F. P. Roullard was to call together two or three representative fruit men and obtain their opinion on doubtful shipments. This he said had worked very satisfactorily in his county.

### Apricots

It was ordered that a limit of three per cent of any one defect and ten per cent total defects be allowed in the packing of apricots. There was some objection to this motion on the ground that apricots affected by shot hole fungus are edible and it was thought that an exception should be made of such fruit. It was pointed out, however, that the Eastern market for apricots is limited at best and that a lowering of standard would decrease rather than increase the demand. As all rejected apricots can be dried or canned, there would be no waste in packing only high grade fruit.

### Pears

A limit of three per cent of any one defect and ten per cent total defects

may be allowed in the packing of pears. There was a difference of opinion as to whether an exception should be made in the case of scabby pears by allowing scab patches of certain dimensions in a pack. In considering the general practice of packing "First Grade" and "Second Grade" pears, the chairman stated that it must be distinctly understood that, while the "First Grade" pack may be of as high a degree of excellence as desired, the "Second Grade" pack must conform to all requirements of the law. As to the variation of size of pears it was decided that a variation of not more than three-eighths inch in size be allowed. The question of the disposal of windfalls was brought up and the sentiment of the meeting was against shipping windfalls as such.

### Berries

The provisions regulating the shipment of berries were deemed sufficiently clear in the law. In the case of strawberries it was shown that the color cannot be uniform because the underside of the berry or the part hidden by a leaf will be a lighter shade even when the berry is ripe.

### Oranges

The term "substantially colored" as interpreted by the State Commission of Horticulture remains the same as last year.

### Plums and Prunes

Ruled that a limit of three per cent

of any one defect and ten per cent total defects be allowed in the packing of plums and prunes.

### Grapes

Suggested that on account of the shortage of cars a special grape conference be held, in order to prevent the difficulties which confronted the grape growers and shippers last season and the consequent waste of the fruit. Also that a uniform method of inspection of grapes be adopted by the county horticultural commissioners. Mr. Brosius described his method of testing in the vineyard and Mr. Roullard advocated the testing of samples brought in by the growers before picking.

## SUNBURN IN FRUIT TREES

By W. L. Howard, Division of Pomology

**F**RUIT growers should be warned at this time against the danger that may result from sunburn in young fruit trees. The beginner in the fruit business especially is liable to overlook the necessity for protecting his trees against sun injury the first year. While trees may sunburn when three or four years old, or even older, they are more likely to be injured the first year they are in the orchard.

One standard remedy against sunburn is to whitewash the trees. A whitewash formula used by many growers in the Sacramento Valley is made by using: Lime 30 pounds, tallow four pounds, salt 5 pounds. The tallow and salt are stirred in while the lime is slaking or while the mixture is still hot. Use just enough water to make a thin paste and then thin to the desired thickness for spreading with a brush or applying with a sprayer.

On young trees that are growing rapidly the whitewash will have to be applied each spring. On old trees where the whitewash is used largely for ornamentation—that is, to improve the appearance of the orchard, it may be desirable to have the wash stick on for two years. The best sticking wash we know of is known as the Oklahoma Formula and is made as follows:

Lime 80 pounds, water 12 gallons or less, salt two pounds, zinc sulphate one pound, boiling water two gallons, skim milk two gallons. Slake the lime in the water and cover the vessel until the steam ceases to rise. Stir occasionally to prevent burning. Dissolve the salt and zinc sulphate in the boiling water and add to the lime water; finally pour in the milk. Thin the solution to the desired thickness for using with a brush or sprayer.

This whitewash is very durable on fences and buildings.

Other methods of protecting trees against sunburn are to use wooden tree wrappers or drive two stakes in the ground so as to shade the tree from the south and west. If trees are well protected from sunburn there may be little or no injury from the flat-headed borers which do so much damage throughout the state. Whitewash is not a secure protection against the borers as it soon cracks as the trees grow. The wooden wrappers are the best all-round protectors against sunburn, borers and rabbits. These should be thrust into the ground for an inch or two to prevent blowing about, and to prevent the entrance of the round-headed or crown borer. The flat-headed borers are not apt to attack trees that are in a good growing condition. Just as soon as the trees become weakened from any cause, or even one part of the tree is weakened from sunburn, the borers are pretty certain to begin their attacks.

A covering of Grade D asphaltum or S Flotline applied in March will keep out the borer, and also serves as a protection against rabbits, but of course will have no effect in preventing sunburn. However, asphaltum does not seem to increase sunburn injury as might be supposed. Asphalt has been used without injury on newly planted trees for the past two seasons at the University Farm at Davis.

Men whose opinions are effective are men of moderation.

Instinct discounts superlatives. And the discount often goes too far—the article's injustice.

*"The Car of No Regrets"*

# KING "8"

It acts as "handsome" as it looks. Every farmer's wife or daughter can take pride and comfort in this fine car

PRIDE of ownership, always a large factor in the selection of an automobile, is selling more Kings this year than ever before.

This pioneer Eight's wide range of performance has astonished many veteran drivers. The ease with which it goes from a crawl to a dash—its conquering power on hills—A "quick on its feet" quality which gets it ahead in congested traffic and makes it so easy for women to handle—its extraordinary economy of operation because of light weight and mechanical perfection—A freedom from the necessity of constant and expert

repair. Reasons enough for pride in King ownership.

The King's beauty of line, elegance of finish, and riding comfort, are not easily described—but are quickly perceived. The Touring Car (shown above) is graceful, yet roomy. FOURSOME—is the "sport" model, seats four and outdoes all competition in the style and grace of its "destroyer" lines. A luxurious seven-passenger Sedan completes the line.

### WOMEN'S LAND ARMY OFFERS HELP

The Women's Land Army, with headquarters in Los Angeles, has already sent two detachments of women workers to tomato fields in Elsinore, Riverside County. Organizing Chairman Eastman of the Los Angeles office writes to Cultivator readers:

"Let the women do the work," once the flippant refrain of a topical song, has become the popular chant of hundreds of fine girls and their older sisters throughout the country. Last week the offices of the Women's Land Army, on the fourth floor of the Chamber of Commerce Building, Los Angeles, were besieged by recruits eager to enlist in the army of food production. Over 700 registrations were taken and every day sees the growth of this finest of movements.

The Women's Land Army is here for service to the farmer who hasn't enough labor. We know that the shortage this year in California alone is estimated at 12,000. That means that unless the women of the country take the place of their men folk in the fields there will be ruined crops, want at home, and starvation abroad. Ranchers, fruit growers, dairymen, farmers of every kind are urged to write or telephone to the Land Army and see if they cannot send them the labor that means not only adequate food at home but the means of victory on the battlefield. The organizing chairman will be glad to arrange units of workers to suit the needs of the individual farmer or group of farmers. Two units are already at work and giving satisfaction. Two more are being made up to help the dairymen, and other units are ready to leave whenever the call comes.

Remember it costs you nothing to use this office, and if you find the help you are looking for, the Land Army feels that with your cooperation it has struck a blow for freedom.

We feel very much gratified that Manager D. W. Harvey of the Sedco Ranch, where our first unit is at work, has asked us for a second unit and has given us permission to refer to him for recommendation of the work they are doing.

### RURAL ETHICS

Here are a few pungent paragraphs from The Sperry Family. They are intended for salesmen rather than producers, but every one of them has a lesson for every one of us. Business courtesy which aids salesmanship may lead to commercial advantage; it always adds to the comradeship of every day life.

In selling goods, in print or person, good nature is a prime essential.

Never attack a competitor. Never appear ungracious.

Never complain at defeat.

Play business like a game of golf. Be always the cultured gentleman, always the good fellow.

Be efficient. Watch your chances. Make every stroke tell to the limit. But be fair with your opponent. Observe the rules. Sometimes stretch them, if you see a chance, in your rival's favor.

Applaud his master strokes. Show a sunny disposition. Be always a good sport.

An easy manner indicates reserve power. To the casual onlooker, the man who smiles always seems the winner.

Men buy more things because they like the salesman than logic ever sold them.

### "DINKUM APPLES"

We find this in an Australian fruit paper:

"In an American fruit advertising campaign, a name was adopted for a good brand that was being pushed. It was called the 'Skookum' brand. So when householders went to buy apples they asked for Skookums. It was a good stunt. Skookum is an Indian word meaning 'bully' or 'good.' Dinkum is an Australian word with a similar meaning. There's a fortune awaiting the fruit district which will standardize its pack, advertise, and call it 'Dinkum.'"

Some things may be the best of their kind in the world. But it is pretty hard for finite minds to know it. And harder still for cynical minds to believe it.

# Farm for Profit

## and Help U. S. Win the War

Authoritative tests have proved that as high as 50 per cent increase in crop production may be expected from proper use of fertilizer. Do you realize what that increase means? Fertilizer is the basis of crop production, and compared to the prices of the crops they help to produce, fertilizers were never so cheap as they are today.

## MORE CROPS

will be raised in America this year than ever before. Make every acre you own or rent, produce to the limit. Fertilize your land—the increase in yield and price of crops will more than pay all the fertilizer expense—it will enable you to farm with profit. Don't spend your time working worn out land. Make it pay—Fertilize with Hauser's Organic Fertilizer.

Notice of complaint must be sent us within 30 days from date of the transaction, and the subscribers must have mentioned the Cultivator when writing the advertiser.

## THIS WEEK'S COVER

When Abraham Lincoln stood on the Gettysburg battlefield and uttered the few words which have been considered one of the world's greatest orations, he stated as the object of the gathering: "We have come to dedicate a portion of that field as a final resting place for those who here gave their lives that that nation might live. It is altogether fitting and proper that we should do this." Then immediately he referred to the fact that the real dedication, consecration and hallowing of the ground had been by the brave who struggled there, adding; "It is for us to be dedicated" and other immortal words which we use this week. And today in face of an even greater war and as great a moment for our nation as that when Lincoln stood on Gettysburg, we may well memorize those words while we honor the brave boys who laid down their lives to preserve the Union. The day we formally observe is next Thursday, but Lincoln's words should inspire us to a daily observation of this memorial.

## PETTY THIEVERY

A subscriber refers to the good old times when the stealing of a \$4.50 nag was the only preliminary step necessary to a hanging bee and asks regarding the automobile parties from nearby towns which often swoop down on the defenseless farmer and pick "with their own hands" just a few fruits or roasting ears without thought of recompense. It isn't as common as it was at one time, but there is a strange perversity of human nature which justifies the youngster in stealing an occasional watermelon and older people in committing a petty theft. The farmer is justified in securing the arrest of these trespassers.

## HOME ON FURLOUGH

Thousands of former farm hands will spend a harvest time furlough at home. The war department has ruled to that effect and the director general of railroads has been asked to grant half fare to all agricultural workers who will spend their furlough in the harvest fields.

## PREPARE FOR PEACE

Preparation for peace is being made with far more forethought than was our before war preparation for war. A bill has recently been introduced providing for reeducation of crippled soldiers and sailors who will return from the battlefield. The war risk insurance act has been amended so as to provide for continuous process of functional and occupational rehabilitation. The federal board for vocational education is issuing a small monthly publication which will outline the work of this branch of the government. Canada has already taken up this line of work and this country has begun it none too early.

## COMMUNITY LOYALTY

The editor of the National Stockman and Farmer suggests that "The man who is not loyal to his own

ago America raised \$100,000,000 and placed it in the hands of the Red Cross, and she was faithful to her trust to the extent that for every one dollar which the people gave she spent one dollar and two cents in actual relief work. Hundreds of thousands of dollars of the fund raised in California remained at home to aid in caring for the families of some who went to the trenches but were unable to care for their dependents as they would like. The hundred million has been spent; now another hundred million is asked. Before these words are read the request will be granted, and we hope with an increase of at least a hundred per cent.

## GIVE BETTER MARKET

Southern California poultrymen in common with poultrymen the country over have had one big task to pay war prices for feeds and secure the cost back at war prices for poultry and poultry products, but they have organized; they have cooperated; they sent carloads of eggs to New York when they needed them, and have done their best and have had a measure of success.

As a step toward more profit, when hatching first began this season members of the association decided that

## MEMORIAL DAY

Honor it. Observe it. It is not a day for games and jollification. Men died (are dying today) that the Union be preserved, that Liberty shall not perish. We have dedicated one day of the 365 in memory of their service, their sacrifice. Let its observance be sacred.

community, his own neighborhood and his own home is not liable to be boiling over with patriotism for his country."

It's true as preaching. Are you a good citizen? Are you supporting farmers clubs, farm bureaus, the Grange, the Farmers Union, the cooperative marketing organization or other community effort which is endeavoring to make for community efficiency, national efficiency?

This is a pertinent question worthy of answer "by return mail." We don't expect the answer, however, for every farmer competent to give the answer is too busy.

## RED CROSS

The terrible sufferings of soldiers in the Crimean war in 1859 resulted in the first organized effort looking toward the alleviation of suffering by adequate hospital service. The Crimean situation appealed to that great English philanthropist, Florence Nightingale, and she gave her time, her abilities and even her life, for her health soon broke under the strain. But even after the Crimean war she came to America and assisted in alleviating suffering in this country. Later, a Swiss humanitarian heard the appeal for more effective work in reducing the awful sufferings of war. His agitation of the question resulted in an international conference at Geneva in 1864. His efforts were seconded, and in fact the organization of the Red Cross was made possible, by the showing made by American delegates to the conference of the effective work of the United States sanitary commission.

This "greatest mother in the world" has a wonderful record for alleviating suffering, not only on battlefields, but in time of great disasters. Membership in the organization numbers many millions. No civilized country is without its organization. A year

as soon as the red of the comb began to show or as soon as the little cockerels could be selected from the pullets, perhaps at the age of three or four weeks, they would be immediately killed. Feed prices could not be recovered at usual spring broiler prices. However, the matter was presented to the dealers in Los Angeles and an agreement was entered into whereby the poultrymen agreed to feed the cockerels until they reached the weight of a pound and a quarter, and the dealers in turn agreed to take them at 32 cents per pound. When the broilers were ready for market the agreement was "forgotten," and instead of 32 the price soon dropped to 28, later to 25, and by easy stages to 21. One of the producers tried an experiment. San Francisco prices were far higher; in fact if at three-quarters of a pound or better, the broilers were quoted at 40 cents; if above a pound and a half, 45. This was more than 100 per cent above Los Angeles prices. A few crates were shipped; the shrinkage was heavy; expressage, cartage and other items materially cut into the producer's returns, but sales account, after making these deductions, came back with check to the producer with a net of 29.61 cents per pound.

Food Administrator Cole was appealed to; he presented the matter to the dealers, and they have agreed to stand by the early season agreement and pay 32 cents to the producers. This sounds good, but unfortunately it has been found that the market is glutted and the buyers "have thousands of dozens already on hand."

## DRIED FRUIT INTERESTS

Dried fruit men of California have appointed a committee of six which is to look after dried fruit interests and in every way to serve the government if called upon to do so. The committee is made up of men representing the cooperative fruit interests and packers as well.

## This Week's War Notes

Congress is discussing a new war revenue and tax bill.

Early in the week it looks as if the Red Cross drive would result in liberal oversubscription.

The appearance of American troops at the review by King George won unbounded praise from English observers.

Many Irish agitators have been arrested, and it is understood that there was an understanding between Sinn Feiners and Germans.

It appears that Japan and China are increasing their forces in Manchuria, and it is thought that loyal Russian troops will fight with them.

The Prussian autocracy has strengthened its hold on the German people, and the effort looking toward democratization is postponed indefinitely.

The secret service has developed the fact that the I. W. W. and German propagandists have a definite plan of sabotage and destruction of property in oil districts and grain fields.

The emerging of the Hun navy is anticipated, and the Jackies of the Allied navies are hoping the Huns have their nerve and make the attempt. Many have thought this will occur at the same time land operations are renewed.

German U-boats are creating consternation among Norwegian fishermen. Notice has been served upon all Norwegian craft that they will be destroyed as fast as they can be located. The Norwegian people are greatly concerned as to the future of their nation.

London was raided by Hun airships and 37 men, women and children killed; many others injured. The Allies' flyers retaliated by attacking Cologne, and from information through Switzerland by the way of Amsterdam it was learned that serious damage was visited upon the city and many killed.

Russia has grown more restive, especially in the southeast toward Persia. Troops opposed to German interests have destroyed vast quantities of foodstuffs to prevent them from falling into German hands. The Germans have threatened the capture of Petrograd; but no definite advance has been made.

The president has approved the act of congress bringing under the army draft law all men who have attained 21 years of age since June 5, 1917. The new eligibles are to appear before their local boards on June 5, 1918. Male persons, whether citizens or not, are required to register. It is estimated that this will make 800,000 new men available for military service.

Italy is urging America to declare war against Turkey. There have been no great activities on the Italian front though slight advantage has been gained by Italian forces. Many have anticipated that Austria is planning to renew the drive at the same time the German drive is renewed on the western front, but the Austrian forces have internal problems of their own which makes a difficult situation.

The renewal of the great drive on the western front is still expected. The Allies have used the last three weeks in perfecting and making stronger their positions. To do this, advances have been made and German trenches have been captured. This has materially strengthened the Allies' positions. Artillery action has been incessant and air activities have resulted in the sinking of many planes, with the advantage on the side of the Allies. The press seldom refers to Hindenburg, and it is assumed that Ludendorf has the direction of enemy forces. General Foch is supreme in command of the forces of the Allies; the trust in him is complete; and it is said that the morale of the army was never better. This has been increased by the continual arrival of American troops.

# Agricultural News Notes of the Pacific Coast

## Northern California

Sonoma County dairymen are organizing cow testing associations.

Ukiah Valley, Mendocino County, reports exceptionally light crop of prunes.

Mendocino County stock men have reported death of several animals from mysterious poisoning.

Pear growers of Hayward are to be addressed by President Swett of the State Pear Growers' Association.

Edward Brown, poultry specialist from London, England, is to address poultrymen of Haywards, May 28.

Sutter County board of supervisors has enacted an ordinance which it is hoped will greatly reduce field fires.

It is now found that the north winds of the middle of April have materially lessened Sacramento Valley's grain output.

Woodland high school pupils are breaking in gradually by syndicating their labor on near-by ranches every Saturday.

Fifty cattle and sheep men whose stock is ranging in Plumas forest reserve have organized a cattlemen's association.

Secretary Ayers is endeavoring to organize Humboldt County dairymen into an auxiliary of the Associated Dairymen of California.

Sonoma County farm bureau directors are taking steps for a county agricultural fair, horse racing and amusements to be eliminated.

Sutter County farm bureau recently made trip to Placer County and inspected Geraldson's system of handling orchard with native cover crop.

State board of horticultural examiners will hold an examination of candidates for horticultural commissioner of Napa County, June 3, at Napa court house.

Land owners of Butte County are contemplating the construction of an irrigation system for lands lying between the foothills and the Feather River south of Oroville.

## Central California

Farmers near Tulare are planting belladonna plants.

Prunedale, Monterey County, is organizing a farm bureau center.

A charter has been issued for the Kern County Cotton Growers' Association.

The United States food administrator in Kern County is endeavoring to stop flour hoarding.

The Madera County farm bureau picnic recently called out an attendance of 150 farmers.

Nearly 100 cattlemen of Kern County have organized and will affiliate with the state association.

Kings City, Monterey County, anticipates the early construction of a bridge over the Salinas River.

Salinas, Monterey County, is still discussing as to whether it will hold its annual rodeo and round-up.

County Horticultural Commissioner Collins of Tulare County reports distribution of nearly 78 tons of poisoned barley.

Frank T. Cunningham, supervisor of Sequoia national forest, has moved his headquarters to California Hot Springs.

Wheat flour conserved by California housewives is now being shipped to the extent of 15,000,000 pounds direct to France.

Tulare County squirrel exterminating campaign is to be aided by Expert Neville from the state horticultural commission.

Madera union high school gets \$50 prize awarded by the county chamber of commerce for the greatest number of squirrel tails.

The San Joaquin County Fruit Growers' Association has appealed to the governor for closing of the saloons as a war measure.

Tulare County Cattlemen's Association has elected W. J. Fuljham, president and County Farm Adviser Conner as its secretary.

Hughson, Stanislaus County, reports its grain fields as injured by recent high winds which caused lodging of the heavy growth.

Oakdale, Stanislaus County, showed an increase of 25 per cent in output of its creameries. Its output of butter was over 100,000 pounds.

The Pacific Pea Packing Company's plant at Oakdale, Stanislaus County, is starting on the biggest run in its history. It has 400 acres of peas at Ripon where it has a huller.

Storekeepers of Exeter, Tulare County, will remain open through the summer only afternoons and evenings. The proprietors and helpers agree to go to the farms and orchards and put in the forenoons harvesting crops.

Horticultural Commissioner Hickman of Monterey County is warning farmers that lepidium draba, one of the pepper grass family, is a worse pest than morning glory and strong measures of control should be taken at once.

The United States marshal at Fresno has received full text of the anti-sabotage act and is now ready for every traitor who proposes to lower efficiency of any producer of war materials, and "war material" not only covers ammunition, but live stock, foodstuffs, fuel, and practically everything used by human beings.

## Southern California

Palo Verde ranchers are finding broom corn profitable.

Fred Rafferty has been made farm labor agent of Orange County.

Long staple cotton growers of the Imperial Valley are talking of organizing.

Mecca, Riverside County, is the earliest shipper of onions in California.

Mecca, Riverside County, is shipping tomatoes and other early fruits and vegetables.

Asparagus production of the Imperial Valley has been materially reduced this year.

Articles of incorporation have been filed by the California Alfalfa Growers' Association.

Citrus experiment station at Riverside is investigating as to the fertilizing value of peat.

Orange County proposes to plant 65,000 acres to beans and she hopes to harvest 750,000 bags.

Imperial Valley's output of barley will be 30 per cent greater this year than any preceding year.

San Jacinto, so sorely stricken by the earthquake, expects soon to show no mark of its unwelcome guest.

Forest supervisors and rangers of Southern California recently met at Escondido for a two-day conference.

The bureau of markets reports Southern California's output of early onions as lower than that of last year.

Ventura County farmer bean growers are lying low for bean thieves who sometimes have taken off as much as 20 sacks in a night.

Palo Verde Mutual Water Company has purchased 6000 gallons of oil to spread on stagnant pools for the benefit of the pest of mosquitoes.

Horticultural inspection of orchards at Victorville, San Bernardino County, shows almost entire freedom from insect and fungous pests.

The boys of the Sherman-Institute, the Indian school at Riverside, have volunteered and aided in the work of cleaning one of Riverside's parks.

Ventura County's farm bureau recently met at Fillmore and listened to an address on lemon culture by Manager Fleet of the Rancho Sespe.

The American Beet Sugar Company has purchased additional land near the factory at Oxnard. The land will be used for homes for its employees.

The management of the domestic water system of the city of Riverside estimates the loss of a million gallons of water daily and announces that the waste must be stopped.

Women of Thermal, Riverside County, recently held a strawberry festival to secure funds for the purchase of an electric sewing machine to be used for Red Cross work.

The Puente, Los Angeles County, Walnut Growers' Association reports within its membership 4500 acres of walnuts owned by 202 members. This is 99½ per cent of the tonnage of that section.

Coachella Valley is coming ahead, this in part at least because of help secured from the federal loan bank which has aided in the development of new tracts. Some of her lands are now producing three crops per year.

## The Coast and General

Oregon's agricultural service flag has 1056 stars.

One large Oregon lumber mill is now using 60 soldier loggers.

Idaho Farmers' Union has erected two new elevators within the past two months.

An Oregon sheep grower recently disposed of a bunch of sheep for \$140,000.

Douglas County, Oregon, boys are making money trapping moles for their fur.

Stockmen of the Northwest are finding feed conditions more favorable than a year ago.

Receipts of cattle and hogs at 44 cities in April showed increase over those of April a year ago.

The adjutant general of Idaho reports the I. W. W. situation as better in hand than for some months.

Dairymen of Lewis County, Washington, are organizing in order to secure better returns for butter fat.

Australia is to ship a million and a half bushels of wheat to California mills. Norwegian vessels will be used to carry it.

Navajo County, Arizona, markets annually about 15,000 head of cattle, 60,000 head of sheep and a million and a half pounds of wool.

Louisiana operated 150 sugar factories during 1916, which was reduced to 140 in 1917. However, the quantity of sugar and syrup was much greater in 1917.

The big 7500 ton concrete vessel, Faith, has made its trial trip, and the shipping board has contracted for a duplicate of it. There are also being built a large number of 400 ton barges. These will be used on the Erie canal.

The National Implement and Vehicle Association has been investigating as to the vast number of types and sizes of farm implements, and the members have reached an agreement whereby nearly 2000 of these different types will be withdrawn.

## Stacks Hay Fast WITH MINIMUM HELP

### Davenport's Triumph Stacker

Four men and one boy can stack from 65 to 85 tons of hay in a day with Davenport's Triumph Stacker. You can save enough on labor in putting up 400 tons to pay for the stacker which will last for years. Low priced. Economical, Efficient, Durable. Send for description and price list of our complete line of hay tools.

## King of the Black and Whites

was the first bull in the world whose seven nearest dams averaged over 30 pounds butter in seven days, and with his 30 A. R. O. daughters he has the largest list credited to any sire in service in California today. He has a large number of daughters yet to freshen in some of the best eastern herds, and he is being bred to a long list of highly bred, high record cows and heifers in our herd, assuring him a commanding place in the list of A. R. O. sires with corresponding value attached to his get.

## King Lillian Walker Segis

our youngest herd sire, is by King of the Black and Whites and out of Lillian Walker Pietertje 2nd, a 24.69 pound four year old daughter of King Segis and the 30 pound cow Lillian Walker Pietertje, who is out of the 30 pound cow Beauty Pietertje, who in turn is out of Prilly, one of the breed's foremost foundation cows. The rich breeding of this young sire, coupled with the exceptional promise of the first calves dropped to his service, assures a great future for him and his offspring.

## King Pontiac Segis Inka

our other herd sire, is justly entitled to be called the best bred son of King of the Pontiacs in the west. He is out of Segis Inka 3d, a 20.89 pound two year old daughter of De Kol 2nd's Butter Boy 3d and the 28.04 pound cow Segis Inka who is dam of the 29.62 pound cow A. & G. Inka McKinley who in turn is dam of the great King Segis. Segis Inka 3d also made 15,158.2 pounds milk and 684.56 pounds butter in one year as a two year old, and would unquestionably have made one of the great records of the breed had she lived to mature age.

These are the three great sires to which most of the

## 25 Registered Holstein Cows and Heifers

in our consignment to the Fourth Sacramento Sale, June 5-6, are bred, and it will be to your interest to study carefully the pedigrees of these great cows, together with the extended pedigrees of the three bulls noted above, then consider that in working with this blood in your herd you are working with one of the largest breeding establishments in the west, and you will surely decide that it is to your best interests to own some of them.

## 5 Choice Young Registered Holstein Bulls

are also included in our consignment, and we have selected some of our best individuals of high class breeding for this offering.

You are cordially invited to see our consignment at the ranch or at the sales grounds where they will be quartered three days before sale date.

**Henderson Company**  
Sacramento Bank Bldg., Sacramento, Cal.

# PRINCE RIVERSIDE WALKER

represents about the best combination of Walker-Mead breeding that we know of, and on top of the wonderful records made on both sides of his family, including several world's records, there is a big future ahead for the large number of his sisters and other near female relatives yet to be tested, and who are about to add further honors to already well proven families.

We have only a few bull calves by Prince Riverside Walker to offer. Dairymen who know take them away from us long before they reach service age. You might find one here that would just suit you. Give us a call or write your needs.

**Our Entire Herd is  
Tuberculin Tested**

## Tulare Holstein Farm

W. J. Higdon, Owner TULARE, CAL. H. L. Redd, Herdsman

## Don't Overlook a Necessity!

Hot weather, like it did last year, will find you without a necessity. Buy now and be prepared to cool your milk and cream.

## The Chilly King Cooler

is a cooler that is easily kept clean; the milk flows on the outside cooling surface which is absolutely seamless and free from dirt collecting cracks or corners; 100 per cent efficient.

Write for free descriptive circular on coolers.

## Save Every Well-Favored Heifer Calf

THE patriotic effort to secure greater production of foods is being met by dairymen with hearty response, at least in many sections; although the editor of the American Agriculturist calls attention to the dairy census in New York showing a reduction by 4000 in dairy cows. He assumes the New York situation is true in other sections and adds:

### Surplus Only Temporary

While just now we have a temporary surplus of dairy products, that is not because we have too many cows or are producing too much butter, cheese, liquid milk or condensed products; the surplus existing today is due to other conditions—to lack of bottoms to carry butter fat, cheese and condensed products to other parts of the world where these products are much wanted.

If shipping facilities were available, every pound of milk or cheese or butter or condensed product would be at once in demand at high prices. Reading, therefore, in the paper about a surplus in milk means a temporary surplus only, and is due to shipping facilities rather than to any other reason. There is a factor, however, that has tended to produce for a moment a surplus—the lesser use of milk in homes because people have thought that they could do their bit by such saving as a step in food conservation. The campaign to lessen bread consumption and butter has also been effective in decreasing the consumption of milk. This was a mistake, of course. To ask people to use less of milk and its products was to expect cooperation which increased current stocks of all dairy products. The food administration has recognized this error, and is now doing commendable work in correcting it.

The situation that confronts the dairy industry is temporary, therefore, and soon will find its own correction. Without a doubt there have been thousands of cows of little value in the dairy. Many of these cows were producing milk at no profit and in numerous cases actually at a loss. Sending cows of this type to the butcher is commendable and shows the fine judgment of dairy owners. Undoubtedly also the higher prices for second-grade beef have been potent in moving the less productive cows from the dairy stables to the slaughtering pens. The really alarming feature of the dairy situation is observed in the fewer heifer calves that are being raised. This means that the normal increase of dairy cows to meet the normal increase of population is not keeping pace, and

that there will be an actual shortage of cows for supplying milk for the ordinary need of consumption.

While a milk famine will not actually result, a milk shortage is one of the possible conditions unless this tendency to slaughter dairy heifers is checked. So much for conditions in this country. The double reason for saving every well-favored heifer calf lies in the demand for dairy stock in Europe with the conclusion of the war. Dairy animals have been slaughtered right and left, not only in warring countries but in neutral countries. The shortage of food abroad for the past 12 to 24 months has depleted European countries of thousands upon thousands of dairy animals in each, many of the very best quality. There are over 30 million less dairy cows in Europe today than existed prior to the outbreak of the war. After the war this country will be called upon to supply not only vast quantities of dairy products of every kind and description, thus requiring the use of every dairy animal here, but the United States will have to supply vast numbers of dairy animals for these other countries. This, refers both to young stock and mature.

### Far-Sighted Will Profit

Heretofore America has not been an important dairy exporting country, but as soon as the war ends dairy heifers and cows, running into hundreds of thousands, will be exported. Hence the farmer who veals, or otherwise disposes of his well-favored dairy heifers, will be taking a small price for an animal that if held would be worth many times the money obtained for it at this time. By saving these heifers no risk will be run, no loss whatsoever has to be faced.

Whether these heifers enter into the exporting list or are kept here at home, it matters not. The world will need them as dairy matrons for milk and butter production and for breeding cows to restore the terrible losses of past years and to increase the dairy population to meet the needs of milk-hungry human population. The far-sighted man is the one who wins. To be the far-sighted dairyman of these times, be the man to save every well-favored dairy heifer in your herd. Do this to maintain your own milk output, your own herd, your neighbors' depleted herds, and to send abroad. The man who keeps and raises his dairy heifers will find his foresight will be repaid many times over. Save the heifers, the well-favored dairy heifers—in them will be a treasure that means both money profit and human service.

## The Big Sale at Sacramento

WHEN the auctioneer mounts the block at California State Fair Grounds, Sacramento, on the morning of Wednesday, June 5, it will mark the beginning of two busy days selecting and bidding and selling of the 139 head of fine registered Holsteins that are entered in the Fourth Sacramento Sale. The large number of dairymen who are buying registered Holsteins this spring are showing a keen interest in this sale, and quite a large number have already made their plans to be on hand to try and secure some of the good foundation animals. Established breeders are also looking toward this sale with an eye to the addition of a few high class animals to their herds, for some of the best bred and most desirable animals ever offered in a public sale in California will be sold during the two days.

A survey of the entries in the sale shows a total consignment of 124 females and 15 bulls from nine prominent California herds, several among them selling at Sacramento for the first time.

Buena Alta Herd, Oakland, makes practically a dispersal sale with 15 head entered. This herd won prominently in the show ring last year and the year before, and has in the offering a 29 pound cow, a 26 pound cow, and a fine four year old daughter of the latest century sire, Pietertje Hengerveld Segis. This heifer made over 22 pounds butter in seven days as a

junior two year old, and as she is a choice individual and a granddaughter of King Segis she will no doubt prove to be one of the attractions of the sale.

Pacific States Corporation, Tulare, although not wanting to sell any females, have contributed four choice heifers to help along the idea of offering only the better class of animals in public sales. Two of their heifers are daughters of Prince Juliana De Kol Walker, son of Prince Gelsche Walker and the former world's record cow Juliana De Kol, one of a daughter of King Korndyke Sadie Vale 2nd, and the fourth is that great heifer, Pascoe Segis Pontiac, daughter of James J. Jeffries' splendid sire, King Segis Pontiac Jannek, and out of a 27.96 pound three year old dam. And besides that she is bred to W. J. Higdon's \$6500 bull King Korndyke Pontiac 20th. There promises to be keen competition for ownership of this heifer.

Bonita Stock Farm, Lodi, sell ten choice young cows and heifers, nine of them bred to the 32 pound sire Supreme Glista Pietje. This is a highly bred consignment of good individuals, including a granddaughter of Prince Gelsche Walker, and a daughter of Admiral Walker Prilly out of a dam that made 847.55 pounds butter in one year as a four year old.

Henderson Company, Sacramento, have an unusually well bred offering of young cows, most of them bred to

Dutchland Sir

Pieterdje Creamelle

is a name that is becoming firmly entrenched in the story of high producing Holsteins in California.

By a grandson of the great transmitting cow Changeling, and out of a daughter of the former world's record cow Creamelle Vale, he is bred to great production and has already proven his worth with 13 A. R. O. daughters in our herd, records up to over 30 pounds butter in seven days.

We enjoy a steady sale of good bulls to dairymen, many of them coming back for their second and third bull. We believe we can fill your requirements in the bull line. Write us or visit our farm.

have up around 23 pounds butter in seven days.

The J. S. Gibson Company, Williams, went into some of the tops of their herd for this sale, and among others will offer the highest yearly record daughter of their 40 pound herd sire Prince Alcartra Korndyke. She made 729.6 pounds butter in one year last year as a junior two year old. In their offering will also be two good daughters of Prince Gelsche Walker, and several high record cows, most of them bred to Prince Alcartra Korndyke, son of Tilly Alcartra.

A. W. Morris & Sons Corporation, Woodland, will sell some choice young cows and heifers bred to King

Bessie Oak Segie

Four year old daughter of Segis Oak Homestead Fobes. Henderson Company.

PURE BRED

REGISTERED HOLSTEINS

Prince Gelsche Walker Korndyke

shown above, is a money maker right today for every man who is fortunate enough to secure one of his good young sons.

At the moderate prices at which we sell them, there is margin for a very substantial profit in the increased value that is sure to come just as soon as his daughters begin to go on official test, which will be within the next few months.

Remember that we are not selling any daughters of Prince Gelsche Walker Korndyke. We are developing what we think is a really high class herd, and we have not been able to find any females that we judge are superior to the daughters of this great sire as foundation females.

Why not take our tip and buy one of his young sons now, and join the ranks of the many dairymen who will benefit through our official test work? Remember that we extend liberal terms and sell at moderate prices.

King Korndyke Pontiac

is shown below, and he is being bred to practically all of the daughters of Prince Gelsche Walker Korndyke.

JANE GARDEN FARM

SACRAMENTO CALIF.

FRED W. KIESEL PROP'R.

C.W. YOUNG SUP'T.

Prince Alcartra Korndyke

is a 40 pound bull, but that doesn't begin to tell the story. His sire is Korndyke De Kol's Prince, whose offspring rank with the offspring of any bull that ever lived in combined production and individuality. His dam is the one and only Tilly Alcartra, the cow that made a 40 pound record as an incident, not as a real objective, for she did it after five straight years of yearly test during which she produced a volume of milk and butter unapproached by any other cow of any age or breed. And today at past nine years of age she is making the greatest record for milk and butter of her whole career. We have only a few sons of Prince Alcartra on hand. We know if you could see them and find how moderately we price them that you would want one to head your herd. Come and see us, or write your wants.

## A Beautiful Bull from this Great Cow

WILL HEAD OUR CONSIGNMENT TO THE  
**Sacramento Sale, June 5-6**

Did you ever start out to find a herd sire with just the right type, the right color, popular breeding, great records and at serviceable age? If you have ever undertaken that task you can appreciate the splendid value represented in this great young sire.

His dam is a 35 pound daughter of Changeling Butter Boy, sire of four daughters that average 36.04 and 139.87 in 30 days. His 100 A. R. O. daughters are young and much is in store for them.

His dam's dam is almost a 32 pound daughter of Tidy Abbekerk Prince, 85 A. R. O. daughters, nine of which are above 30 pounds.

His sire's dam is a 32 pound daughter of De Kol Burke, sire of eight above 30 pounds, and a half brother to Hengerveld De Kol.

His sire has a 34 pound three year old daughter, 138 pounds in 30 days and 932 pounds in a year as a two year old, all of which are California state records.

### A Splendid Son of King Mead of Riverside

is also consigned, out of a 100 per cent sister to the above cow. Her record is 26.76, and 107.98 in 30 days and her dam has 30.54 pounds. A wonderful combination of breeding, type and records and ready for service.

In addition to these we are including four beautiful cows and six well bred heifers, in calf to KING MEAD OF RIVERSIDE, PRINCE GELSCHÉ WALKER and KING MORCO ALCARTRA.

Consider well the opportunity offered in this consignment for a foundation herd, headed by one of the best young bulls ever offered in any sale.

**A. W. Morris & Sons Corp.**  
Woodland, Cal.

Mead of Riverside, Prince Gelsche Walker, and King Morco Alcartra. Probably the star of their consignment is the young bull Segis Pontiac Abbekerk, son of Segis Pontiac De Kol Burke and Changeling Tidy Abbekerk Gem. His dam made over 34 pounds butter in seven days last year

**Etta Changeling Sadie Vale**

Daughter of King Korndyke Sadie Vale 27th and a 22 pound three year old daughter of Changeling Butter Boy. She and six sisters by McAlister & Sons.

and came back this year with over 35 pounds in seven days and is still on test. She is a daughter of Changeling Butter Boy and a 31.70 pound daughter of Tidy Abbekerk Prince, and both sides of the pedigree indicate that this is one of the very best young bulls ever offered for sale in the West.

McAlister & Son can always be depended upon to offer a choice lot of cattle when they sell, and their offering in this sale is a notable one. Their star attraction this time may be the great 30 pound junior four year old Ontario Blond Pietje, although she should be closely pressed for top honors by Queen Rose Walker, daughter of Prince Gelsche Walker and a 27 pound daughter of a 32 pound cow. In this offering also are nine daughters of King Korndyke Sadie Vale 27th, two daughters of King Korndyke Sadie Vale 22nd, four daughters of King Segis Pontiac, and two daughters of King Segis De Kol Korndyke. These females are also out of wonderfully bred dams, many of them with high records ranging up to over 30

**Ontario Blonde Pietje**

A 30 pound junior four year old of a 35 pound sire. McAlister & Son.

pounds butter in seven days, and they are bred to It and King Winnie, both out of dams with records above 1200 pounds butter in one year. There are two splendidly bred young bulls also in the McAlister consignment, one of them by King Korndyke Sadie Vale 27th and out of a 29 pound daughter of King Segis 11th who is a 34 pound son of King Segis.

There are so many attractive ani-

mals in the sale that the foregoing will serve only as a sample, for a study of the animals, catalog in hand, is the only way a full appreciation of the unusual quality of this sale can be gained.

The sale will be managed by California Breeders Sales and Pedigree Company, Sacramento, whose constructive sales policy is rapidly winning widespread confidence among buyers and sellers alike.

## Tales of a Traveler

Written for California Cultivator By C. A. Briggs

B. H. Crocheron, state leader of the farm adviser army says that the department of agriculture asked the farmers of the United States this year for a round billion bushels of wheat. To do this, California's quota called for an increase of 80,000 acres. The county farm bureau in charge of the work asked the farmers to devote one-tenth of the acreage usually put in barley to the growing of wheat as a patriotic war measure. To date 101,000 acres are enlisted for wheat production. Some good work for the farm bureaus.

Another stunt the farm bureaus have pulled off is the increase in pork production; again a patriotic duty. Breeding sows were being slaughtered because the large breeders were losing money under present day prices of feed and pork. The 450 farm bureau centers with 20,000 members took up the work of getting small farmers and fruit growers interested in keeping, where they had a few hogs, one or two more; where they

had no hogs, at least one good porker. Today partial reports from half of the 450 farm bureaus show 11,816 hogs getting fat to fight Germany that would without doubt have gone to the packer in an unfinished condition.

There are approximately 225 boy pig clubs in the state with over 2000 boy members, and they are doing things that open their "daddies' eyes. A number of the clubs have finished their competitive feeding tests and all have made a fine showing. Every boy without exception has made a success; every boy has made a profit over all costs of hog, feed and labor. This profit ranges from \$3.00 to \$12 per head.

A point of note is that the exact cost estimates kept show that a very large percentage of the pure bred hogs of all breeds have made gains over those made by the several hogs fed. The pure bred put on pork at a less cost per pound than the "just any old hog" kind.

## Increasing Efficiency by Alternating Teams

Hurdcroft Farm reports the following interesting illustration of the amount of work it is possible to do by using heavy teams and alternating teams during the rush season. This information was contained in recent letters to the Percheron Society of America:

"I may say that we have just finished seeding 170 acres of oats in three and one half days' time, with one drill and eight registered Percheron mares. One set of four mares started at daybreak and worked until noon, being replaced by the other four, which stuck to the job until dark.

"We have a 10½ foot drill which four good mares will handle nicely at

a good stiff walk. We found we were doing an average of approximately three acres an hour, or between 45 and 50 acres in a 16 hour day. Where the field was half a mile long we would make the round trip in 20 minutes, seeding about 1¼ acres each round.

"The first set of mares would go on at daylight, the second set relieving them at noon and going until dark. Will say three of the mares weighed better than a ton, the other five between 1800 pounds and a ton. They were all good walkers and seemed to handle the big drill with ease. Three of the mares have just dropped good, strong colts and the others are due shortly."

## 130 Registered Jerseys 130

—AT PUBLIC AUCTION—

**Thursday, June 27, 1918**

**Lockeford, California**

Think of this splendid herd, containing five grand champion females, every one of which will be sold, 85 cows in milk and only one cow in the entire lot with a lost quarter, beautiful heifers bred in the purple and good enough individually to go out and win this fall in our best shows, and all of them to go to the highest bidder on sale day.

### BULLS

The four great herd bulls, Imp. King's Valet, Borello's Golden Laddie, Grace's Fox of Venadera, and Norma's Gertie's Son of L, will all be sold.

In addition there will be at least 25 choice bulls ready for service, ranging in age up to two years, out of the best cows in the herd and all sons of the great herd sires. Dairymen will have such an opportunity to secure high class registered Jersey bulls as had never before been offered in a public sale in the west, and will find the selection well worth a long trip from the remotest ends of the state.

Every animal guaranteed to be a breeder, tuberculin tested, and sold subject to tuberculin retest by the buyer. Every animal pledged to absolute sale without reserve or limit.

## How Would You Like to Own

**Ontario Blonde Pietje**, at four years 30.07 pounds butter in seven days. The youngest 30 pound cow ever sold at auction in the West. She is a "blonde peach" and is now milking about 85 pounds per day. Safe in calf to our great 37 pound herd sire, "IT."

**Queen Rose Walker**, a beautiful daughter of Prince Gelsche Walker from a 27.98 pound daughter of a 32 pound cow.

**May Korndyke Sadie Vale**, a daughter of the famous May Korndyke, for years the youngest 30 pound cow of the breed, sired by a 30 pound son of King Korndyke Sadie Vale.

Seven daughters of **King Korndyke Sadie Vale 27th**, one of whose daughters at six months old sold at public sale for \$1400, out of dams with records as high as 29 pounds.

Three daughters of **King Korndyke Sadie Vale 22nd**, whose two nearest dams average over 35 pounds.

Four daughters of **King Segis Pontiac**, one of the most famous sires of Holstein History.

Ontario Blonde Pietje

Queen Rose Walker

Two daughters of the great **King Segis De Kol Korndyke**, sire of the former world's champion 40 pound four year old; one out of a 28 pound four year old and the other from a 22.95 pound cow.

Two daughters of **King Segis 11th**, a 34 pound son of King Segis.

Two daughters of **Annie De Kol Model Segis**, a son of the greatest high record show cow of the breed.

Four daughters of **Juliana King Repeater**, a son of the former world's record three year old for yearly production, **Queen Juliana Dirkje**.

A daughter of **King Pontiac Mayflower**, a 31 pound son of King of the Pontiacs from a 27 pound granddaughter of King Segis.

A son of **King Korndyke Sadie Vale 27th** from a 29 pound four year old daughter of King Segis 11th and one from a 22.95 pound cow.

Many are bred to "IT," son of the first 37 pound cow, **Pontiac Clothilde De Kol 2nd**, the greatest transmitting cow of the breed. What will the harvest be?

The Quality is unsurpassed and Health is Guaranteed

## Field Notes from the Live Stock Men

W. M. Carruthers has purchased an under one year gilt, Brighton Farm Laurel of H. L. and E. H. Murphy. Mr. Carruthers plans to show it at State Fair in young herd.

Tietje Queen De Kol 2d 228996 has shown a production of 639.3 pounds milk containing 34,632 pounds fat in seven consecutive days. She freshened at the age of four years, ten months, 26 days. Her sire is Sir Pontiac Korndyke 6th 66229; her dam is Tietje Queen De Kol 95772. She was bred by W. L. Keyes, Deerfield, N. Y.; and she is now owned by A. C. Howe, New Hartford, N. Y. With this production she is the 32nd cow to obtain place in the list of Holstein-Friesian cows with productions exceeding 32 pounds fat in seven days. Computed on the 80 per cent basis the equivalent butter claimed for Tietje Queen De Kol 2d amounts to 43.29 pounds.—Malcolm H. Gardner, Supt. A. R.

Hog raisers who attended the annual meeting of the California Swine Breeders' Association at University Farm, Davis, May 16-17, had opportunity to learn results of a milo maize feeding experiment conducted by Prof. C. M. Vestal. The object of this experiment was to determine the value of milo maize fed in different forms. Lot one was fed whole milo heads; lot two received whole heads ground; lot three was fed milo grain, soaked; lot four was fed milo grain ground. In each lot the milo was hand-fed, but tankage was fed in a self-feeder.

J. E. Thorpe, Lockeford, says that he has an extra fine "futura" bunch of Durocs and plans to be at the state fair to fight for the honors.

W. S. Guilford and W. P. Dwyer of Butte City Ranch write as follows: "We were fortunate in saving all of our Shorthorn, Berkshire, Shropshire and pony records from the fire which destroyed our house, office, warehouse and men's quarters recently and no animals were burned. We have now placed a duplicate set of records in a safety deposit box—a

precaution every breeder should take."

K. P. Tola Joe, state champion two year old owned by Gottschall & Magruder of Ripon, has freshened with a heifer calf and is now on official test. There are now five other cows on the farm being tested.

Idleaze Pontiac Lass 238652 has shown a production of 715.5 pounds milk containing 33,987 pounds fat in seven consecutive days. She freshened at the age of four years, 14 days. Her sire is King of the Pontiacs 39,037; her dam is Pelham De Kol Urma 109314. She was bred by Stevens Brothers Company, Liverpool, New York; and she is now owned by J. W. Vaughan, St. Johnsville, New York. With this production she is the thirty-third cow to obtain place in the list of Holstein-Friesian cows with a production exceeding 32 pounds fat in seven days. Computed on the 80 per cent basis, the equivalent butter claimed for Idleaze Segis Lass amounts to 42.48 pounds.

Two Holstein-Friesian cows, Leafy Dawn De Kol 112845 and Sunrise Hengerveld Caroline 137314 have each produced about 32 pounds fat in seven days and are reported on the Holstein list by Malcolm H. Gardner, secretary of the Holstein-Friesian Association. Computed on the 80 per cent basis, this makes both these above 40 pounds of butter. They are both owned by Abbott & Clark.

A. O. Clement of Hawthorne owns a litter of pigs that when six weeks old weighed 36 pounds apiece, and at the age of nine weeks tipped the scales at 52 pounds; they are half Berkshire. It would be hard to find a finer lot.

Delaware College, recently sold a Guernsey, Anton's May King 27387, for \$7000 and his half sister Molly Rose O. D. 50617 for \$1750. Delaware College students in agriculture have used these animals for class room instruction and have been inspired with an enthusiasm for better dairy cattle

by working with these exceptional individuals.

Royal's Pearl 45209 completed her second record in class D, February 10, 1918, with 16,930.4 pounds of milk and 788.37 pounds of butter fat. She began Advanced Register work when only two years and one month old, making a record in class G of 485.88 pounds of butter fat, this record being over 100 pounds in excess of the average of her class at that time.

Leafy Dawn De Kol 112845 and Sunrise Hengerveld Caroline 137314 have each produced above 32 pounds fat in seven consecutive days. The former, whose sire is Sir Lilith Pauline De Kol 35727 and dam Annie Mooney Pietertje 69312, freshened at the age

of ten years three days, and is reported as producing 659.9 pounds milk containing 34,016 pounds fat. The latter, whose sire is Sir Hengerveld Barnum 49743 and dam Caroline Jucunda 73447, freshened at the age of eight years, eight months, one day, and is reported as producing 736.5 pounds milk containing 32,040 pounds fat. The former was bred by Byron Barstow, Earlville, New York, and the latter by Ralph Corbin, Bainbridge, New York; and they both are now owned by Abbott & Clark, Cortland, New York. With these productions mentioned, the former is the 34th cow to obtain place in the list of Holstein-Friesian cows with productions exceeding 32 pounds fat in seven days, while the latter is the 35th cow in the list.

## Save the Roughage

ACCORDING to the report recently made by United States department of agriculture the loss in grain straw and corn stover amounts to more than \$100,000,000 annually. Both of these products are disposed of most economically when fed to cattle in connection with some form of concentrated feed. Straw is especially valuable as a supplementary roughage for fattening cattle. Stover too, is an excellent feed for wintering cattle, especially mature breeding cows. Nevertheless, in many sections of the country where these products are abundant little attempt is made to take advantage of their value for these purposes.

Of an annual straw crop of approximately 120,000,000 tons it is estimated that only two-thirds is put to its best use—live stock production. Of the remainder a little more than one-half is sold or turned under, and the rest—15 per cent of the total crop—is burned. Burning is practically an absolute waste and although plowing under does contribute something to soil fertility, the benefit to the land is less than that which would be derived from the use of the straw to produce manure. "Of all systems of obtaining

permanent soil fertility," says the report, "none is so practical or easily available as that of feeding live stock."

The average value of all kinds of straw is placed at about \$5.00 a ton. In many sections, of course, no such price can be realized for it, and as a matter of fact only about eight per cent of the crop actually is sold. The figure mentioned, however, may be taken as representing the value to the farmer of straw if he will use it properly in his farming operations as feed or bedding.

By far the most economical method of handling corn is by ensiling, but as a matter of fact only 8.1 per cent of the acreage was put in the silo in 1914, the year in which these investigations were made. About 11 per cent was cut for green feed and 81 per cent allowed to mature for grain. It is in the last portion of the acreage that the greatest waste occurs. Stripping the leaves from the stalks which are subsequently burned, removing the stalk above the top ear only, leaving the stalk to stand in the field until the loss of leaves and leaching have removed much of their fertilizing value, are all unthrifty methods. Furthermore, almost four per cent of

## HOLLYWOOD FARM

**F. S. Stimson, Owner**

**Hollywood, Washington**

the stover is burned, as though, instead of being a potential source of revenue it was merely a nuisance to be gotten rid of as a preliminary to plowing. In some states the percentage of stover that is thus thrown away is as high as seven or eight per cent and the total loss to the country from the practice is estimated at nearly \$15,000,000 a year.

To obtain satisfactory results from the feeding of farm roughages such as straw and stover, they must be combined with some form of concentrated feed. At the present time large quantities of such feed in the form of cottonseed meal and cake, corn, molasses, peanuts and beans are exported for the use of European feeders. If the straw and stover that are now wasted were employed to feed more cattle, these concentrates could be consumed at home. The result would be a tremendous saving not only in the cost of producing beef but in the cost of enriching the soil as well. In 1914, for example, about 1,000,000 tons of cottonseed meal, half the total production, were applied directly to the soil as fertilizer. If this had been fed to cattle instead, three-quarters of the fertilizing value would have been returned to the soil as manure. The loss of the other fourth would have been far more than counterbalanced by the profit on the meat produced economically by the meal and the necessary roughages. Much the same thing is true of the other oil meals.

#### JERSEY CHAMPIONS IN CALIFORNIA

The American Jersey Cattle Club sends list of Jersey class champions in California. They are:

Under Two Years: Jewel of Venadera 275316, owned by Guy H. Miller, one year 11 months, 8017.8 pounds milk, 442.40 pounds fat.

Two Junior: Manie Owl 261075, D. F. Conant, two years, three months, 7830.3 pounds milk, 435.14 pounds fat.

Two Senior: Interested Jap's Santa 296928, University of California, two years, 11 months, 9052.5 pounds milk, 588.16 pounds fat.

Three Junior: Goldie of Venadera 243321, Guy H. Miller, three years, three months, 8910.1 pounds milk, 469.50 pounds fat.

Three Senior: Jewel of Venadera 275316, Guy H. Miller, three years, six months, 10,262.6 pounds milk, 609.54 pounds fat.

Four Junior: Sultan's Golden Blue Belle 213751, L. J. Belknap, four years, two months, 8979.1 pounds milk, 525.51 pounds fat.

Four Senior: Mermaid's Fern 269301, University of California, four years, seven months, 9657.6 pounds milk, 536.80 pounds fat.

Over Five Years: Pearl of Venadera 208644, Guy H. Miller, eight years, two months, 11,723.9 pounds milk, 702.70 pounds fat.

One hundred twenty cows on test in February, 1918.

#### MARKETING OF BRED SOWS

Reports from the large live stock markets to the United States department of agriculture indicate that the rumor of a general tendency to sell bred sows for slaughter is without foundation. At most of the stockyards the percentage of sows docked for advanced pregnancy has decreased since the first of the year and is smaller for the first three months of 1918 than for the corresponding months of 1917. At a few markets a larger percentage of sows than normal showed advanced pregnancy, but this appears to have been due to delays in getting cars for shipment. Such a showing, in normal times or in the absence of special propaganda for increasing the national meat supply, probably would not have been noticed.

#### OFF TO ASIA

R. S. Valle, for many years connected with the citrus experiment station at Riverside, is now on his way to Northern Persia. He is going as an agriculturist under the American committee for Armenian and Syrian relief. He will remain one year or longer. His work is not definitely lined out but it is to be one of service in increasing foodstuffs. We have promise from Prof. Valle that if mail service and other conditions permit, he will write for Cultivator readers of his experiences.

## Fourth Sacramento Sale STATE FAIR GROUNDS, SACRAMENTO Wednesday and Thursday, June 5-6, 1918

Space will not permit mention of all of the attractive individuals in this sale, but the following is a sample:

#### FEMALES

ONTARIO BLOND PIETJE, a 30 pound junior four year old daughter of a 35 pound sire.  
A DAUGHTER OF KING SEGIS PONTIAC JANNEK, out of a great 27.96 pound three year old, and bred to the \$6500 bull, King Korndyke Pontiac 20th.  
A DAUGHTER OF PRINCE GELSCHIE WALKER, out of a 27 pound daughter of a 32 pound cow.  
A DAUGHTER OF PRINCE ALCARTRA KORNDYKE, son of Tilly Alcartra, and she made 729.6 pounds butter in one year as a junior two year old.  
A 29 POUND DAUGHTER OF SIR PONTIAC RAG APPLE KORNDYKE, and her young son by the 31 pound sire, Lakeside King Segis Alban De Kol.  
NINE DAUGHTERS OF KING KORNDYKE SADIE VALE 27th, one of a 29 pound dam, one out of a 27.24 pound junior three year old daughter of Changeling Butter Boy, one out of a 22 pound three year old daughter of Changeling Butter Boy and a 30 pound daughter of Tidy Abbecker Prince, one out of a dam that made 608 pounds butter in one year as a junior four year old, one out of a 17 pound two year old daughter of Count Segis, and the balance out of good dams.  
THREE DAUGHTERS OF KING KORNDYKE SADIE VALE 22nd, one out of May Korndyke, for several years the youngest 30 pound cow, and bred to IT, one out of a 20 pound dam, and one out of a daughter of King Segis Pontiac Zella.  
FIVE DAUGHTERS OF KING SEGIS PONTIAC, out of choicely bred dams.  
THREE DAUGHTERS OF KING SEGIS DE KOL KORNDYKE, one out of a 28 pound daughter of King Walker Segis, one out of a 22.95 pound four year old granddaughter of Pontiac Hengerveld Parthena.  
A 20 POUND THREE YEAR OLD DAUGHTER OF PRINCE GELSCHIE WALKER, bred to the 40 pound sire, Prince Alcartra Korndyke.  
A DAUGHTER OF PRINCE GELSCHIE WALKER, out of a 19.25 pound three year old that made 549.53 pounds butter in one year as a junior two year old.  
A 26.41 POUND COW and her daughter by Sir Korndyke Veeman Hengerveld, 30 pound son of Sir Korndyke Pontiac Artis.  
A 23.97 POUND FOUR YEAR OLD granddaughter of King Segis Hengerveld.  
TWO DAUGHTERS OF PRINCE ARAIA WALKER, son of Prince Gelschie Walker and Aalia De Kol 3d, both bred to a 34 pound bull.  
A DAUGHTER OF A 33 POUND SIRE and her daughter by a son of Prince Gelschie Walker.  
A GRANDDAUGHTER OF HENGERVELD DE KOL, bred to a 32 pound bull.  
A DAUGHTER OF ADMIRAL WALKER PRILLY, out of a dam that made 847.55 pounds butter in one year as a four year old, bred to a 32 pound bull.  
TWO GRANDDAUGHTERS OF KING COLANTHA CLOTHILDA, bred to the great King of the Black and Whites.  
TWO DAUGHTERS OF MODEL LYONS SEGIS, one bred to King of the Black and Whites, the other to his son, King Lillian Walker Segis.

SEGIS PONTIAC ABBEKERK, son of Segis Pontiac De Kol Burke and out of a 35.07 pound daughter of Changeling Butter Boy and a 31.70 pound daughter of Tidy Abbecker Prince. A beautiful individual, mostly white in color, and one of the very greatest young sires ever sold in the west. The 35 pound record of this dam was made this spring, exceeding her last year's record of over 34 pounds butter in seven days.  
A SON OF KING KORNDYKE SADIE VALE 27TH, out of a 29 pound four year old daughter of the 34 pound son of King Segis, King Segis 11th. A splendid young bull of wonderful breeding.  
A SON OF KING MEAD OF RIVERSIDE, out of a 26.76 pound daughter of Changeling Butter Boy and a 30 pound daughter of Tidy Abbecker Prince.  
A SON OF THE 34 POUND SIRE KING PONTIAC

A 23.98 POUND DAUGHTER of King Pontiac Ruby Burke.  
TWO DAUGHTERS OF KING MORCO ALCARTRA, son of Tilly Alcartra.  
TWO DAUGHTERS OF PRINCE JULIANA DE KOL WALKER, out of good dams.  
A 20 POUND FOUR YEAR OLD DAUGHTER of Colantha Sir Pontiac Aagie.  
A 22.87 POUND COW well along with calf to King Mead of Riverside.  
A DAUGHTER OF KING KORNDYKE PONTIAC, out of a daughter of King Mead of Riverside that made over 21 pounds butter in seven days and 751.1 pounds butter in one year as a two year old.  
A DAUGHTER OF SEGIS PONTIAC DE KOL BURKE, out of a 22 pound four year old granddaughter of Pontiac Korndyke.  
A 19 POUND DAUGHTER of Beauty, Pietertje Beets, bred to a 31 pound sire.  
A 19.54 POUND GRANDDAUGHTER of Colantha Johanna Lad.  
A DAUGHTER OF KING SEGIS PONTIAC EMPEROR, out of a 25 pound cow that made 770 pounds butter in one year.  
A GRANDDAUGHTER OF KING OF THE PONTIACS, out of a 28 pound dam and bred to it.  
A DAUGHTER OF KING PONTIAC MAYFLOWER, out of a 27 pound granddaughter of King Segis.  
TWO DAUGHTERS OF KING SEGIS 11TH, who is a 34 pound son of King Segis.  
A FOUR YEAR OLD DAUGHTER OF PIETERTJE HENGERVELD SEGIS, and she made 22.12 pounds butter in seven days as a junior two year old.  
RIVERVIEW BRACELET BRETT, first prize two year old at 1917 California State Fair, Fresno Fair, and San Francisco Land Show.  
A DAUGHTER OF LAKESIDE KING SEGIS ALBAN DE KOL, out of a 25 pound four year old granddaughter of King of the Pontiacs.  
A DAUGHTER OF A 29.61 POUND COW bred to King of the Black and Whites.  
A 19.18 POUND TWO YEAR OLD, bred to King of the Black and Whites.  
A DAUGHTER OF ARTIS PRILLY OF RUSSEL FARM, out of a 26 pound daughter of Artis De Kol Walker.  
A DAUGHTER OF MODEL LYONS SEGIS, out of a 24.78 pound granddaughter of Johanna Rue 3d's Lad.  
A DAUGHTER OF SEGIS CREAMCUP PONTIAC, son of Segis Pontiac De Kol Burke and a daughter of Ignaro De Kol that made 877.3 pounds butter in one year as a four year old, bred to the 40 pound sire of Prince Alcartra Korndyke.  
A DAUGHTER OF KING KORNDYKE PONTIAC, out of a granddaughter of Ignaro De Kol, bred to Prince Alcartra Korndyke.  
A 26.43 POUND COW bred to the 40 pound sire, Prince Alcartra Korndyke.  
AN 18.41 POUND THREE YEAR OLD that made 620.47 pounds butter in one year as a junior two year old.  
A DAUGHTER OF COUNT SEGIS, bred to King Morco Alcartra, son of Tilly Alcartra.

#### BULLS

NETHERLAND SEGIS 3D, out of a beautiful 26.86 pound four year old dam.  
A SON OF KORNDYKE SADIE VALE 27TH, out of a 22.95 pound dam that is three-quarter sister to the 41 pound cow, Valdesa, Scott 2nd.  
MODEL DOMINO GLISTA, son of the 30 pound sire, Model King Segis Konigin, and out of a 21.72 pound three year old daughter of the 30 pound cow, Glista Cora.  
A SON OF KING PONTIAC SEGIS INKA, out of a 25.70 pound four year old daughter of King Pontiac Calypso.  
A SON OF KING PONTIAC SEGIS INKA, out of a 25.71 pound three year old granddaughter of King Walker.  
A NUMBER OF OTHER HIGHLY BRED YOUNG BULLS that round out one of the finest consignments of bulls ever offered in a California sale.

Every animal in this sale is positively guaranteed to be a breeder, is tuberculin tested AND SOLD SUBJECT TO TUBERCULIN RETEST BY THE BUYER.

The cattle will be on exhibition at California State Fair Grounds, Sacramento, the place of sale, two days prior to sale. Intending purchasers are invited to come and look them over before sale, and we will extend every facility for gaining complete information on each animal to be sold.

## Northern California Notes

Written for California Cultivator By W. S. Guilford

A daughter of a 33 pound bull out of a 22.85 pound 4 year old granddaughter of King of the Pontiacs.  
—her beautiful young daughter by Prince Gelsche Walker.  
—A granddaughter of Hengerveld De Kol out of a daughter of King Segis Pontiac.  
—A daughter of Admiral Walker Prilly out of a 4 year old that made 847.55 pounds of butter in one year.  
—and four other choicely bred young cows and heifers.  
—with two splendid young bulls.

make up our  
Consignment of

## Registered Holsteins to the Fourth Sacramento Sale Sacramento, June 5-6

We feel certain that our first consignment will reflect credit upon our herd, and that whoever is fortunate enough to buy these splendid young animals will do so with profit and satisfaction to themselves. All of the females except one are bred to our herd sire

### SUPREME GLISTA PIETJE

whose sire is by the best son of the great transmitting cow Pietje 22nd and is out of a daughter of Duchess Ormsby Butter King that made 18,623.7 pounds milk and 827.31 pounds butter in one year.  
His dam is Glista Eglantine, 32.39 pounds butter in seven days, who in turn is out of Glista Omricon, 31.60 pounds butter in seven days, and she is sired by Prince Ybma Spofford 6th, six of whose 11 daughters have records from 30 to over 35 pounds butter in seven days, one of them over 1000 pounds butter in one year.  
Supreme Glista Pietje has a splendid lot of young daughters growing up in hands where they will be given the fullest opportunity, and his offspring will be sought after at substantial prices. Don't overlook this opportunity to buy choice young cows bred to him.  
See our consignment on the farm before sale if you wish.

**Bonita Stock Farm**  
Lodi, California

## Santa Anita Rancho Anoakia Breeding Farm Registered Holsteins

Depth of body is a prime requisite in the high producing dairy cow, and is especially desirable when found in combination with other outward evidences of dairy quality. Great deep bodies are outstandingly characteristic in the offspring of

### Merci Lad Korndyke Burke

our senior herd sire, who is by De Kol Hengerveld Burke and out of Winnie Korndyke Cornucopia De Kol, 31,034.1 pounds milk and 1201.00 pounds butter in one year, the first cow in California to produce that amount of butter in one year.  
We have a few of his sons, out of good record dams, for sale.  
Inquiries or orders by mail will receive careful and prompt attention.

## Tagus Ranch consigns to

## Pascoe Segis Pontiac

HER SIRE: King Segis Pontiac Jannek, who is by King Segis Pontiac and out of a 29.71 pound four year old daughter of Korndyke Queen De Kol's Prince, and she is dam of the sire of the 40.13 pound cow Albina Josie.

HER DAM: Forest View Wayne Korndyke, a 27.96 pound three year old granddaughter of King Segis Pontiac and De Kol 2nd's Butter Boy 3d.

SHE IS BRED TO: King Korndyke Pontiac 20th, the \$6500 son of Miss Valley Mead De Kol Walker.

We ought not to sell this heifer, but we yielded to the request to offer some of the very best heifers in our herd, the others being

TWO VERY CHOICE DAUGHTERS OF PRINCE JULIANA DE KOL WALKER, both of them bred to King Sadie Vale Rose, whose three nearest dams average 33.82 pounds butter in seven days, and he is a son of King Korndyke Sadie Vale. Both of these heifers are out of well bred A. R. O. dams.

A DAUGHTER OF KING KORNDYKE SADIE VALE 22ND, who is a 30 pound son of King Korndyke Sadie Vale, and a double grandson of King Segis De Kol Korndyke. This heifer is just now of breeding age and will be sold open.

We like the idea of offering only high class cattle in public sales, which solely is responsible for our decision to part with these good heifers.

### ANOTHER DRY YEAR

THE normal rainfall at Red Bluff in the Sacramento Valley to May 15 is a little over 24 inches, at Sacramento about 20 inches. At Red Bluff the rainfall for the season totals about 12 inches, at Sacramento 10.61. Last year the rainfall at these points was about seven inches less than normal.

Dry years cause crop shortages, but they also make better farmers. Deep plowing, thorough cultivation and all kinds of soil moisture conservation methods are essential if crops are to be raised. And every available means for irrigation is made use of because it pays to do this.

There are good crops of grain on summer fallow land that was well worked last season and planted early. This had some "hold over" moisture from last year and the benefit of all of this year's rainfall.

There are short crops on some of the best river front and ridge winter sowing lands. Some grain has been irrigated. Some farmers are planning to run rough contour checks in their grain fields this fall and give the land a thorough soaking with irrigation water every fall as an insurance proposition. They believe that dry years

are of sufficiently common recurrence to warrant this.

The value of fall plowing land to be used for corn, beans and such crops is strongly emphasized this season. We have a field at Butte City Ranch that shows a good moisture content now in spite of the fact that we had no overflow from the river this year. Last year this field was plowed in the spring and produced very little because of lack of moisture. This season it was plowed early last fall, harrowed and disked later, replowed and redisked this spring, and is being disked some more now before planting to corn. There is a far better prospect for a crop now than at this time last year.

That more water for irrigation must be stored on the headwaters of the Sacramento River and its tributaries is no longer a question that is argued. Just how it can best be provided is the problem.

### BIG RICE ACREAGE PLANTED

The largest acreage ever in rice in the Sacramento Valley has been planted; most of it has been watered once, May 18; some of it is up and making good growth. Conditions for providing irrigation works and preparing the land for the crop have been ideal, not only during the spring season but through all of last winter. A dry year suits the rice men, at least in so far as the planting of the crop is concerned. A plentiful supply of irrigation water and an open fall for harvesting will insure a bumper crop.

Rice has been planted on better land this year than in previous years, that is, a larger percentage of the acreage is made up of lands that have been cropped in grain in former years. Of course the bulk of the acreage on the west side of the Sacramento is on the heavy clay lands that have been used largely for pasture and that are very risky grain farming propositions taken one year with another. But in addition to these many areas of pretty fair summer fallow grain lands have been put in rice this season.

The rice growers of the Sacramento Valley will make a big contribution to the food supply of the world this season.

### HIGH HAY PRICES IN PROSPECT

There seems to be a certainty of high prices for hay for another year. Large fields of grain that promised good yields were dried up by the north wind in April, and the poor grain that would have made hay will now make nothing but a little pasture. Fields that were not hit quite so hard will make a little grain, but the straw is so short that it would not pay to bother with it for hay. And with all other feeds high in price alfalfa must continue to be so.

### BUY PURE BRED STOCK NOW

With all kinds of feed for live stock high in price now is the time to get started in the pure bred live stock business. Good registered stock will give better returns for feed consumed than grades or scrubs, and when feed prices are lower—as they are sure to be some time—there will be particularly keen demand for live stock of all kinds. By getting a few young animals now a valuable stock will be grown at comparatively small expense. Many farmers are selling big herds of grades and replacing them with smaller herds of pure bred.

### RED CROSS

The Red Cross is the mightiest of all charities, the love and pity of all men made supremely efficient. It not only seeks to alleviate the cruelties of war; it is the expression of those human sentiments that some day will put an end to war.—Dr. Frank Crane.

If the soldiers are willing to serve in the trenches, to dig ditches, build railroads and risk their lives, many civilians can well afford to spare a part of their time to serve in the furrows and in the harvest fields.—Secretary of Agriculture.

If you believe in peace you will fight to get it.

# Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Cyclamen for Seed

Will you please give culture and care of cyclamen from seed, soil, location, in fact anything pertaining to their care?—Subscriber, Ceres.

The growing of cyclamen is not so simple as most other plants. It is usually left to the professional. In any case, glass house, or conditions giving plenty of light and warmth at all times are necessary. From Bailey's Cyclopaedia of Horticulture we take the following instructions:

"It is preferable at all times to begin the culture of Persian cyclamen with seeds, sown in the early winter months. Grow on without any check for the following year. They should bloom freely about 15 months from planting. Old tubers, such as are offered in fall with other florists' bulbs, rarely give satisfaction as compared with a packet of seeds. It is not the nature of the plant to have all its roots dried off as if it were a hyacinth or tulip. It will be found that cyclamen seeds require a long time in which to germinate, — often two months. This is due to the fact that the seed produces a bulb or corm before leaf-growth is visible. As soon as two leaves are well developed, place the plants around the edge of four- or five-inch pots until every one is large enough for a three-inch pot. The roots are produced sparingly in the initial stages, and too much pot-room would be fatal at the start. By the middle of summer another shift may be given, and in September all will be ready for the pots in which they are to flower,—five- or six-inch pots, according to the vigor of the plants. It will always be found, however, that there will be a certain percentage that will not grow, no matter how much persuasion is used. These may be thrown away to save time and labor early in the season. In the house they should have the lightest bench. It is impossible to grow them in warm, shady house. About 50 degrees at night is the ideal temperature when in flower. The best soil is a fresh, tufty loam, with a fourth or fifth of well rotted horse manure, to which add some clean sand if the soil is heavy. At all times, the pots should be well drained."

### Mulefoot Hogs

Where did the mulefoot hog originate? Why is not more heard of them? Have they any market advantage on account of their feet?—Subscriber, Anaheim.

Ewing's Pork Production says, "This is a rather recent American breed of uncertain origin. The foundation stock used was probably Berkshire, Poland-China and native blood. The first members of the breed were mutations in which the cloven foot gave way to the one-toed condition, such as prevails in the horse and mule, hence the name." It was originated in Ohio. It resembles the Berkshire in body but has pendent ears, smaller than most breeds, running 450 to 500 pounds. They are not in any sense cholera immune, and as yet are not generally received by the hog breeders.

### Fly Repellent

Is there something that can be spread around the barnyard, manure, cow corrals and hog pens to prevent the flies from hatching? They are very troublesome in the house. I have tried fly catchers but they are not satisfactory.—Subscriber, Anaheim.

At the best, the control of flies where there are open manure pits and corrals, is difficult. Prof. Herms of the state university has given intensive study to this subject and it has been treated in former Cultivators, but perhaps the best information may be had by writing University of California Agricultural Experiment Station, Berkeley, and asking for Bulletin 215, "The House Fly in Its Relation to Public Health." In this bulletin Prof. Herms gives formula for a com-

pound which will destroy the larvae of flies if sprayed on manure piles. Great care should be exercised in its preparation and use as it is corrosive and poisonous.

Formula: Dissolve one-half pound caustic potash in one half pint water, let stand several hours until dissolved and cold; add this to one quart of raw linseed oil contained in an earthenware vessel, stirring the while, and repeat the stirring process at intervals of about one hour for from four to five hours, then let stand over night. This process will result in a soap to which must now be added slowly, while stirring, one and a quarter quarts of commercial cresol which will gradually dissolve the soap. Three or four days may be necessary to effect complete solution. For use, this compound must be diluted at the rate of one part to 30 of water. The quantity given above will produce from 12 to 15 gallons. Apply to the manure pile or garbage. Poultry must not be permitted to feed upon the larvae thus treated.

### Ayrshires for Range

Will you give your opinion of Ayrshire cattle on a hilly range, for beef purposes? Also, I have two acres within the reservation, bought by me from the parties who had a deed from the government before reservation was set aside. How many cattle can I run on the reservation, how much does it cost per head, and how do I go about it to get permission to run them there?—Subscriber, Orange.

The query as to suitability of Ayrshires for range beef purposes was referred to J. W. Clise who answers: "It is unnecessary to say that we do not recommend the Ayrshire as a beef animal, but of the four dairy breeds she comes the nearest to filling your requirements. Produced in the western part of Scotland, in the hilly country where the vegetation is rather scarce, she will thrive where the other breeds will make a failure. In the eastern part of this state where the rainfall is light and conditions similar to yours, the Ayrshire is the only dairy animal that will thrive on the range. She will not take on fat while milking, but fattens easily after being dried up. The beef is red and the bone small. She ranks with the Short-horn in quality of beef."

As to running cattle on forest reservation, this is a matter which must be referred to the forest supervisor of your district. The number of range animals allowed on each reservation each season is definitely established by the department of the interior, but all arrangements as to price, permission to range, etc., are made with the local supervisor. If you write U. S. Forestry Service, Federal Bldg., Los Angeles, giving name of forest reserve, you can secure office address of your district supervisor.

### Egg Eating Hens

I noted in the Cultivator some time ago Mrs. Koethen gave information regarding correcting the habit of egg eating hens. Have found this problem is easily solved by feeding them plenty of lime. My method is to break lime up with a hammer.—W. Helfrick, Palmdale.

### Feijoa not Bearing

I have a tree, feijoa I think. In any case it has light green silver leaves and beautiful red flowers. The tree is seven years old, blooms every year, but it never fruits.—Subscriber.

The feijoa is a freaky tree. Practically all we have planted are seedlings. From reports received from most of these plantings it appears that more than half of the trees are non-bearers. We believe budded or grafted trees will succeed these and their fruit prove one of the smaller commercial factors in orcharding. We believe there is no way to force this tree to bear.

### Moving Rose and Wistaria

I have two rose bushes and a wistaria to move. What is the best time to do it, and how? Do they have to be cut back? — Subscriber, Owensmouth.

It is possible that by cutting back a good bit they can successfully be moved, providing great care is taken to take up large balls of earth. If, however, the ball should be broken it is probable the plants might die. The best time to replant is in dormant season, December to February. If it is a mild winter roses may fail to become dormant, but with care they should live if reset at that time. After cutting back and resetting heavy irrigation should be given to firm the dirt around the roots in the new location.

#### Nearer Home

Will some one send me the remainder of the verses in which are the following lines:

"One sweetly solemn thought  
Comes to me o'er and o'er?"  
—Subscriber, Nipomo.

These lines are from "Nearer Home," written in 1852, the most famous poem by Phoebe Cary (1824-1871).

One sweetly solemn thought  
Comes to me o'er and o'er—  
I'm nearer home today  
Than I've ever been before.

Nearer my Father's house,  
Where the many mansions be;  
Nearer the great white throne;  
Nearer the crystal sea.

Nearer the bound of life,  
Where we lay our burdens down;  
Nearer leaving the cross;  
Nearer gaining the crown.

But lying darkly between,  
Winding down through the night,  
Is the deep and unknown stream,  
That leads at last to the light.

Father, perfect my trust!  
Strengthen the might of my faith.  
Let me feel as I would when I stand  
On the rock of the shore of death:

Feel as I would when my feet  
Are slipping over the brink;  
For it may be, I'm nearer home—  
Nearer now than I think!

#### Pure Bred

I have pure bred Jersey which will have calf from pure bred bull. Will wish to sell this heifer. How much may one reasonably ask for such calf? —Subscriber, Los Angeles County.

The value of such calf depends more upon the performance of its ancestors than upon the fact that it is pure bred. Pure bred calves have been sold above \$50,000 and again "pure bred" have been vealed. Dairymen must learn that the fact that a calf is registered is not conclusive proof of its power to produce. It is a case of works and not of faith. This is where official tests and cow testing associations are doing a wonderful work for the dairymen who have pure bred or even grade stock. If the cow is known to be a great producer and comes from a well known producing strain it should be worth \$25, \$50, \$100, or even more, for some of our sales of pure bred stock have shown calves running from these prices to around \$250. We may also add that there are pure bred which are not capable of registration, for some reason registry has been lost. This of course materially reduces the sale value of such calves.

#### Moving Persimmon

Is it possible to move a persimmon four years old? It is now very small because it has never had very good care. —Subscriber, Los Angeles County.

Unless this tree is one of a particularly valuable strain of persimmon we would prefer to get a thrifty young tree from the nursery rather than endeavor to move it. It is very probable that in dormant season it could be moved and kept alive, but a stunted tree is never very good property.

#### Fig Sprouting

Fig tree sprouts continually, sprouts growing even higher than the tree if they are not pulled off. Should these trees be pruned?—Subscriber.

Sure, prune off those suckers, that is unless the tree is injured and is stunted so that you need a new tree entirely, then begin to reduce the top and allow one of these suckers to make the future tree, ultimately sawing off the old trunk and all other suckers, waxing the ends and allowing the wound to heal over. Then any suckers which may come later should be kept reduced.

#### Curl Leaf

What is the cause of curl leaf in peach trees?—Subscriber.

Curl leaf is caused by a fungus which grows in the tissues of the leaves. It is easily controlled by spraying with Bordeaux in the winter when trees are dormant, or at least before leaving out. There is no cure for the leaves which are now showing the trouble.

#### Severe Pruning

Are fruit trees spoiled for always if they are pruned too much, nothing being left but the large branches?—Subscriber.

"Too much" is too indefinite a term to give definite answer. Some deciduous fruit trees require severe pruning for the first three years of their growth in orchard. These three years are required to build a foundation which will hold up the crops of the future. Other deciduous trees, like walnuts and figs, require but little pruning and may have been severely injured.

#### Grape Mildew

How can I prevent mildew on grapes?—Subscriber.

Apply sulphur early in the season when leaves are just starting and occasionally thereafter. Method of application is with power plant in large vineyards, with small bellows in lesser areas, or the sulphur may be placed in porous sacks which are shaken over the vines. This should be done in the morning when leaves are moist.

#### Rattlesnake Poison

What is the remedy for rattlesnake bites?—Subscriber.

The first remedy should be lancing and free bleeding at point of wound. Sucking the wound so as to remove all poison as quickly as possible is also recommended. This should be followed by the application of permanganate of potash. The victim should be kept in motion as much as possible, and in no case should he be allowed to go to sleep. While these preliminaries are being attended to, competent physician should be summoned. Don't administer large doses of whiskey or other alcoholic without advice of physician, especially to child, for

death from alcoholic poisoning is even more sure than from snake poison.

#### Thompson Seedless and Figs

I am thinking of setting out six acres of Thompson Seedless grapes and would like some information regarding them. Also I would like to know about figs, the kind that would be the most profitable and the age when I could expect a crop from them. —Subscriber, Turlock.

Perhaps the best method of planting Thompson Seedless vines is to plant them six feet apart in the rows and the rows 12 feet apart. This arrangement requires less wire than when planted eight feet by eight or ten by ten, and the cultivation is less expensive. The vines should be staked the second year and the vine which is then trimmed to one stem, tied to the stake. After the second year the vines should be trellised.

The Calimyrna is the best fig to raise and should be planted 30 feet apart. Plant one capri fig to every 30 or 40 Calimyrna trees. These can be planted in any out of the way place and may be planted close together, say 20 feet. Figs will begin to bear a little the third year but not a paying crop till seven or eight years old. —J. W. M.

#### THE BUSINESS TEN

1. Honor the chief. There must be a head to everything.
2. Have confidence in yourself, and make yourself fit.
3. Harmonize your work. Let sunshine radiate and penetrate.
4. Handle the hardest job first each day. Easy ones are pleasures.
5. Do not be afraid of criticism—criticise yourself often.
6. Be glad and rejoice in the other fellow's success—study his methods.
7. Do not be misled by dislikes. Acid ruins the finest fabric.
8. Be enthusiastic—it is contagious.
9. Do not have the notion success means simply money-making.
10. Be fair and do at least one decent act every day in the year.

—Marconi Service News.

Over-statement, in reaction, creates commensurate resistance.

Blatancy does not command respect.

**DR. HESS DIP and DISINFECTANT**

A Dip that is standardized, of uniform strength and **GUARANTEED**. One gallon makes 70 gallons of dipping solution.

**For Scab, Ticks and Skin Troubles**

Dr. Hess Dip and Disinfectant cleans and makes the skin healthy. It is more than a Dip—it is also a Disinfectant. Use it freely about stables, hog pens and poultry houses to destroy disease germs and maintain good health conditions. Also for home use, in garbage cans, sinks, cesspools. Sold by 28,000 dealers on a money-back guarantee.

**DR. HESS & CLARK**  
Ashland Ohio

**THE SELF-OILING WINDMILL**

has become so popular in its first three years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load. We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws.

## A CYCLONE SILO Will Save You Big Money On Your Feed Bill

If you are in the farming business to make money you must save as well as earn—a silo will save you its cost in the first year of its use. With a silo you can convert into first-class stock feed a lot of your product that you have wasted in the past—

### The CYCLONE SILO

—is constructed to stand up under the most trying conditions. Flat iron bands encircle the CYCLONE (as illustrated) in such a way that it cannot possibly twist or warp out of shape—does not get smaller at top than bottom after usage. No guy wires to stumble over.

We, who, make this silo, have been manufacturing wood tanks, wood stave pipe, etc., for use in all parts of the world for 25 years—we know our business and our guarantee that this silo is right means something.

Liner rates: Single insertion 30c per word;  
yearly contracts 2½c per word; 35c per issue minimum charge.

### TREES

**For Sale to Nurserymen or Large Planters**—Owner of a large block of very fine Eureka Lemon trees will sacrifice at a ridiculously low price to those who will take a large quantity. These are not old dirty culled over stock, but strictly first class trees, clean, thrifty and straight, budded high on sour stock, never have been frosted or stunted in any way. Ground has to be vacated by June 1, so this stock will actually be sold at LESS THAN SEEDLINGS CAN BE RAISED. Address X, California Cultivator.

### AVOCADOS

The Spinks is easily the best variety that has fruited in California. It combines the good points of all the others with none of their defects. A rugged, prolific tree and a superb fruit. Field grown trees of this and other well known varieties, including the Rey, Linda, Sharpless, Fuerte, L. X. L., Caribou and others, \$3.00 to \$5.00 each. Liberal discount in quantities. W. A. Spinks, Duarte, California.

**For Sale**—Extra fine Valencia trees, ¾ to 1½, all sour root, high buds, very thrifty, clean and straight, not fertilized, excellent soil for balling, nothing better grown. Can supply a limited acreage yet closing out entire lot of these fine trees. S. R. Coate, 564 S. Los Angeles St., Anaheim, Cal. Phone, Anaheim Pacific 403-J.

**Avocado Trees**, budded, Fuerte variety; a hardy, vigorous grower, bears a rich, delicious fruit. Eighty per cent of all avocado trees planted this year were of the Fuerte variety. Our trees are field grown, straight, symmetrical, with large balls. Send for illustrated, descriptive circular, showing prices. WEST INDIA GARDENS, Altadena, California.

**For Sale: Citrus Trees**—Choice stock, young and thrifty. Selected buds, Valencia and Washington Navel, Eureka and Rialto seedless lemon. Marsh seedless grapefruit; also young seedlings. W. W. Burns, 631 Security Bldg., P. 3110, Los Angeles.

**100,000 Sour Orange Seedbed Trees**—50,000 sweet; choice new stock. Trees lined out this year sure to hit high market. Better plant a few thousand next spring. Southland Nurseries, 1941 East Colorado, Pasadena.

**Valencia Orange and Eureka Lemon trees** one year past, ¾ to 1 inch. Pedigreed stock on sour root, high buds. We will bud 6000 choice seedlings to your order. Seed bed stock for sale. Randall Bros. Nurseries, Whittier, Cal.

**For Sale**—About 25,000 uncultured lemons, Navel and Valencia of the very highest character of pedigreed stock must be removed at an early day from present location. Will sell in the field at 10 cents apiece. Apply John Hinkle, Lordsburg, California.

**Citrus Stock**—Very best Valencia and Eureka lemon trees. Two years old. Pedigree stock. Big strong root system. Grown at San Dimas. Price right. Smith Citrus Nurseries, 1121 Investment Building, Los Angeles. M. 3604; F. 2729.

**Closing Out**—15,000 choice Orange and Lemon trees for sale. Marsh seedless grapefruit, Eureka Lemons, Washington Navel and Valencia. Two year old buds 30c each, or in hundred lots 25c. F. A. Anderson, Elsinore, California.

**For Sale**—All kinds Citrus Nursery stock, 1 and 2 buds, fine roots. Y. Yamaguchi, Box 574, Phone Sunset 470R, Upland, 10th St. and Cucamonga Ave., Upland.

### FARM LANDS FOR SALE

**New Openings**—State land well located, offered first time regardless present value—town lots, acreage, some improved. Your patriotic duty this year to buy state land, to be sold for taxes. Get the money in the treasury, the land on assessment roll, and crops growing on land. Get bargain at one-tenth value. Because of drink, death, leaving country, etc.; years ago this property went to the state. Because of war, work and worry, most persons will pass these bargains to you. Put in your order now for new 1918 lists and particulars, any three counties, \$5.00. Any man or woman can buy on payments without residence. New law makes all safe. You get mineral and oil rights. Get busy or get left. Joseph Clark, Sacramento.

### HELP

We still need a few more settlers to finish our 6000 acres, which is being sold in 40 acre farms at \$25.00 per acre. Ten yearly payments at 6 per cent interest. By selecting your future home in this splendid tract at Bryant, Snohomish County, you are not alone buying a fertile and productive piece of land, but you are buying the best investment in the state today. Railways, paved roads, schools, churches, canneries, creameries and mills.

The best proposition on the market for the man who wants a farm. For further information address the owners, BROWNELL LAND CO., 904 Third Ave., Seattle, Washington.

**For Sale or Exchange**—60 acres rich, alluvial silt soil. Level, irrigated, ready for crop. Real alfalfa land. Domestic water on place. Plenty of irrigation water. 1¼ miles from town, churches, grammar and accredited high school. Half cash, half trade, anywhere. Make your proposition now. Chas. McNeely, Alhambra, California.

**For Sale**—160 acre relinquishment in Kern County. Level valley land all tillable. Near live railroad town. Some improvements, clearing, plowing, fencing, well. Valley grows deciduous fruits, cotton, beans, alfalfa. Plenty of pumping water. Good prospects of gravity system. Electric power. Price \$10 per acre. Address J. Care Cultivator.

**For Sale**—40 acres sediment creek land. One and half miles from Willows, the busiest town in California. Abundant water at 12 feet. Five acres fine young orchards. This land paid \$55 per acre last season. Price \$6000, one half cash. Good for beans, sweet potatoes, watermelons, etc. A. W. Sehorn, Willows, California.

**For Sale or Exchange**—40 acres alfalfa land near Visalia; sandy loam soil, some alfalfa, all fenced, under irrigation. Will take improved or unimproved acreage to amount of \$3500 within 5 or 10 miles of coast Los Angeles or Orange Counties. Give location when replying. Wm. D. Green, Visalia, California.

**Fine level farm land**, California, 160 acres, best of soil. Plenty of water. Near oil belt. Close to McKittrick. We had an offer from oil company six years ago of \$150 per acre. Price now for quick sale \$100 per acre. J. H. Rule, 415 Canal Ave., Wilmington.

**To Reduce my holdings**, I will sell 20 or 40 acres bearing vineyard and orchard. Low price and good terms. J. P. Bolton, 632 Fortcamp Ave., Fresno.

**For Sale**—160 acres at Chandler, Arizona. All cleared; good cotton land; will sell all or part. P. O. Box 126, Cucamonga, California.

## Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

## Holographic Will

If a man and wife each make wills, all in their respective handwritings, leaving all of the possessions of each to the other, would it be legal and binding if one or both of the wife's parents signed their names to both wills as witnesses? Is it necessary for a will to have witnesses? — Subscriber, Los Angeles.

A will which is entirely written, signed, and dated in the handwriting of the testator is valid in this state without witnesses. Such will is known as a holographic will. There are some states in which it is not recognized. Witnesses to such a will are unnecessary, but the fact that it has been signed by witnesses does not affect the legality of the will of that character. The other form of will in common use requires the signature of two witnesses in this state and is not valid unless it is signed by at least two witnesses in whose presence the testator must have signed the will, declared it to be his last will and requested each of the two witnesses then present to sign as witnesses.

## Ditch Right

A owns 20 acres and B the adjoining 40. A joint ditch is made to irrigate five acres of A's land. A and B sell their land to different parties. A's vendee grades the five acres so that he no longer has use for the joint ditch. B's vendee can irrigate his land in two other ways. B's land has been irrigated twice since the ditch was made, four years ago. Can A's vendee close the ditch or have B's vendee buy their share in the ditch? If so, how should they proceed? — Subscriber.

If the ditch was made for the benefit only of A's land, then he would be entitled to close the ditch whenever he chooses. If it was made for the benefit of the land of both A and B, then it can be closed only upon joint agreement of the owners of said lands or, by abandonment by either, the other can close. If there is a recorded grant of this right of way then, in order to clear the property of the encumbrance of the right of way a release from each party should be recorded. If nothing has been recorded, then a simple contract or agreement acted upon by each of the parties is sufficient.

## Heavy Duty Orchard Cultivator No. 3

Killefer Quality

Killefer Efficiency

This 1918 Model Tractor Cultivator is built to meet the demand of the owners of the medium and small size tractors for an extra strong cultivator that could be handled by the tractor driver. It is made on the same lines and of the same high-grade steel as our well-known Monarch Cultivator, but without the hand levers and rear wheel, and with a hand wheel screw lift, making it a perfect one-man, all-steel tool.

We make two weights, medium for the small tractors, and extra heavy for the larger tractors, and in four sizes, 5, 6, 7, 8 and 10 feet wide. We urge you to anticipate your needs in tillage tools as much in advance as possible owing to the uncertainty of steady steel deliveries.

## The Killefer Manufacturing Company

2209-21 Santa Fe Ave.

Los Angeles, Cal.

## The Evolution of Irrigation

Just as the Open Irrigation Ditch was superseded first by wooden and then by concrete flumes, so were the latter in turn forced to give way to the "K-T SYSTEM" of underground conduits, equipped with gates and valves. This provides for a perfect distribution of the water at the exact spot required, and at just the time it is needed. It also eliminates the constant losses resulting from evaporation, seepage, and ditches choked with weeds—wasting land, water, time and money. We are prepared to make immediate deliveries at the present time but cannot promise prompt shipments during the entire season, because of the uncertainty regarding raw materials, labor and other factors of manufacture. Forewarned is forearmed. Place your orders now when you can get the goods. Don't wait until conditions make prompt deliveries impossible.

## DELCO-LIGHT

### Increases Farm Efficiency

Fifty thousand Delco-Light plants in operation on American farms are saving, at the most conservative estimate, an hour a day each—or over 18,000,000 work hours a year.

**That is equal to an army of 60,000 men working ten hours a day for a full month.**

Delco-Light is a complete electric light and power plant for farms and suburban homes.

It furnishes an abundance of clean, safe, economical light, and operates pump, churn, cream separator, washing machine and other appliances.

*Ask us to show you how  
Delco-Light can save time  
and money on your farm*

### THE LITTLE LAD

To me it's always the little lad  
Afraid to speak his name,  
But he was one of the first to go,  
When his heart received the flame.

He used to steal from the shadowy room,  
And over the lighted stair,  
If dismal tales were being told,  
But he won the Croix de Guerre.

He clutched my hand when the thunder  
broke,  
He paled at the lightning's glance  
But he met the Teutons face to face,  
And he fell with the sons of France.

—By Agnes Lee of The Vigilantes.

### THE BLOCKING OF OSTEND HARBOR

**O**NE of the most spectacular feats of the war has been the blocking of the harbor of Ostend by the British fleet. The first attempt, partially successful, was made late in April; the second, May 10. The story of the operations gives us some of the dash and thrill of war. We have heard so much of the gray days and nights in the trenches and the unceasing "chores" of the war, that it is good to read occasionally of the individual feats of courage, of nerve and efficiency. This attack in all its features was scheduled to the minute, planned with all the painstaking care that years of study and experience made possible, yet relying at the last on the bravery, the steady heads and hands of trained fighters. We give the story as issued by the British admiralty:

"Dunkirk, May 11: The Sirius lies in the surf some 2000 yards east of the entrance to Ostend Harbor, which she failed so gallantly to block, and when in the early hours of yesterday morning the Vindictive groped her way through the smoke screen and headed for the entrance it was as though the old fighting ship awoke and looked on. A coastalmotor boat had visited her and hung a flare in her stack and rusty riggings, and that eye of unsteady fire, paling in the blaze of star shells, or reddening through the drift of smoke, watched the great enterprise from the moment when it hung in doubt to its ultimate triumphant success.

"The planning and execution of that success had been entrusted by Vice-Admiral Sir Robert Keyes to Commodore Hubert Lynes, who directed the previous attack to block the harbor with the Sirius and Brilliant. Upon that occasion a combination of unforeseen and unforeseeable conditions had fought against him.

"Upon this, the main problem was to secure the effect of a surprise attack upon an enemy who was clearly expecting him. The Sirius and Brilliant had been baffled by the displacement of the Stroom Bank buoy, which marks the channel to the harbor entrance. But since then aerial reconnaissance had established that the Germans had removed the buoy altogether, and that there now were no guiding marks of any kind. They had also cut gaps in the piers as a precaution against the landing, and, further, it was known that nine German destroyers were at large upon the coast.

"It was a night that promised well for the enterprise—nearly windless—and what little breeze stirred came to a point or so west of north. The sky was lead blue, faintly star-dotted, with no moon, and a still sea for small craft, motor launches and coastal motorboats, whose work was done close inshore.

"From the destroyer which served the commodore for a flagship, the remainder of the forces were visible only as silhouettes of blackness.

"From Dunkirk a sudden brief flurry of gunfire announced that German airplanes were on the way to visit Calais, and over the invisible coast of Flanders the summer lightning of restless artillery rose and fell monotonously.

"There's the Vindictive!" The muffled seamen and marines standing by the torpedo tubes and guns turned to gaze at the great black ship, seen mistily through the screening smoke from the destroyer's funnels, plodding silently to her goal and end. She receded into the night astern, as a destroyer raced on to lay a light buoy that was to be her guide, and those on board saw her no more. She

passed thence into the hands of the small craft whose mission was to guide her, guard her and hide her in a smoke screen.

"There was no preliminary bombardment of the harbor and batteries, as before the previous attempt. That was to be the first element in the surprise. A time table had been laid down for every stage of the operation, and the staff work beforehand even included precise orders for laying the smoke barrage with plans calculated for every direction of the wind.

"Monitors anchored in firing position far seaward awaited the signal. The great sea batteries of the Royal Marine artillery in Flanders, among the largest guns that were ever placed on land mountings, stood by likewise to neutralize the bigger artillery along the coast and the airmen who were to collaborate with an aerial bombardment of the town, waited somewhere in the darkness overhead. Destroyers patrolled to seaward of the small craft.

"The Vindictive, always at a solemn gait, found the flagship's light buoy and bore up for where a coastal motorboat commanded by Lieut. William P. Slayter was waiting by a calcium flare upon the old position of the Stroom Bank buoy.

"Four minutes before she arrived there, and 15 minutes only before she was due at the harbor mouth, the signal for the guns to open was given. Two motorboats under command of Lieut. Albert L. Poland dashed in toward the ends of the high wooden piers and torpedoed them. There was a machine gun on the end of the western pier and that vanished in a roar and leap of flames.

"Over the town a flame suddenly appeared high in the air and sank slowly eastward—the signal that the airplanes had seen and understood. Almost coincidentally with their first bombs came the first shells, whopping up from the monitors at sea. The surprise part of the attack was sprung. The surprise, despite the Germans' watchfulness, seems to have been complete. Up until the moment when the torpedoes of the motor boats exploded there had not been a shot from the land—only occasional routine star shells.

"The motor launches were doing their work magnificently. These perfect warships, manned by officers and men of the royal naval volunteer reserve, are specialists at smoke production. They built to either hand of the Vindictive's course the likeness of a dense sea mist, driving landward with the wind. Star shells paled and were lost as they sank in its beams of searchlights, and seemed to break off short upon its front. It blinded the observers in the great batteries, which suddenly, upon the warning of the explosions of guns, roared into action.

"There was tremendous uproar. The coast about Ostend is ponderously equipped with batteries, each with a name known and identified as Von Tirpitz, Von Hindenburg, Deutschland, Cecilia and the rest. They register from 6-inch to monsters of 15-inch naval pieces in land turrets, and the royal marine artillery fights a war-long duel fire with them. These now opened fire into the smoke, and over it, at the monitors and marines. And the monitors replied.

"Meanwhile the airplanes were bombing methodically and anti-aircraft guns were searching the skies for them. Star shells spouted up and floated down, lighting the smoke banks with spreading green fires, and those strings of luminous green balls, which the airmen call 'flaming onions,' soared up, to lose themselves in the clouds.

"Through all this stridency and blaze of conflict the old Vindictive, still unhurrying, was walking the lighted waters toward the entrance. It was then that those on the destroyers became aware that what seemed merely smoke was wet and cold; that the rigging was beginning to drip, and that there were no longer any stars. A sea fog had come on.

"The destroyers had to turn on their lights and use their sirens to keep in touch with each other.

"There were motorboats on either side of the Vindictive escorting her to

2100 Empire Bldg., Pittsburgh, Pa.

the entrance. These were supplied with what are called Dover flares, enormous lights capable of illuminating square miles of sea. At once every pistol was fired as a signal to light these, but the fog and smoke together were too dense for even the flares.

"The Vindictive then put her helm over and started to cruise to find the entrance.

"Twice she must have washed across and at the third turn, upon reaching the position at which she first lost her way, there came a rift in the mist and she saw the entrance and the piers on either side, and an opening dead ahead.

"The motorboat Up No. 22, commanded by Acting Lieutenant Guy L. Cocklyn, raced on into the opening under heavy and momentarily growing fire, and planted a flare on the water between the piers. The Vindictive steamed over it and on. She was in.

"The guns found her at once. She was hit every few seconds after she entered, her scarred hull broken afresh in a score of places, her decks and upper works swept by machine guns. The machine gun at the end of the western pier had been put out of action by a motorboat's torpedo, but from other machine guns at the in-shore end of the pier from a position on the front and from machine guns apparently firing over the eastern pier, there converged upon her a hail of lead.

"After her control was demolished by a shell which killed all the occupants, including Sub-Lieut. Angus H. MacLachan, who was in command of it, the upper and lower bridges and the chart room, swept by bullets. Commander Godsall ordered the officers to go with him to the conning tower. They observed through the observation slit in the steel wall of the conning tower that the eastern pier was breached some 200 yards from the seaward end, as though at some time a ship had been in collision with it.

"They found the front of the town silhouetted again and again in the light of the guns that blazed at them. The night was a patchwork of fire and darkness.

"Immediately after passing the the breach in the pier, Commander Godsall left the conning tower and went on deck, the better to watch the ship's movements. He chose a position and called in through the slit of the conning tower his order to starboard the helm. The Vindictive responded and laid her battered nose to the eastern pier and prepared to swing her 320 feet of length across the channel.

"It was at that moment that a shell from the shore batteries struck the conning tower. Lieut. Sir John Alleyne and Lieut. V. A. C. Crutchley were still within. Commander Godsall was close to the tower outside. Lieut. Crutchley shouted through the slit to the commander and receiving no answer, rang for the port engine full speed astern to help the swinging ship. By this time she was lying at an angle of about 40 degrees to the pier and seemed to be hard fast; so it was impossible to bring her further around.

"After working the engines some minutes to no effect, Lieut. Crutchley gave the order to clear the engine room and abandon ship, according to the program previously laid down. Engineer Lieutenant-Commander William A. Bury, who was the last to leave the engine room, blew the main charges by a switch installed aft.

"Lieut. Crutchley blew the auxiliary charges in the forward six-inch magazine from the conning tower.

"Those on board felt the old ship shrug as the explosives tore the bottom plates and bulkheads from her. She sank about six feet and lay upon the bottom of the channel. Her work was done.

"It is to be presumed that Commander Godsall was killed by the shell which struck the conning tower. Lieut. Crutchley, searching the ship before he left her, failed to find his body or that of Sub-Lieut. MacLachan in that wilderness of splintered wood and shattered steel. In the previous attempt to block the port Commander Godsall commanded the Brilliant and together with the officers of that ship and of the Sirius had volunteered at once for the further operation.

## HORSE-SHOE-TIRES

Guaranteed for 5000 MILES  
Pacific Rubber Co. Los Angeles

# Cleveland Tractors

Buy Now Save \$105

The price of the Cleveland Tractor now is \$1495, F. O. B., Berkeley—July 1st it will be \$1600. We have purchased 100 Cleveland Tractors, which we can deliver at \$1495, F. O. B., Berkeley. It is a case of first come first served.

We have sold over 200 tractors in Northern California since last fall. A number of large users have given us their second and third orders.

The consumption of fuel is 8½ gallons of distillate and 1½ pints of good grade lubricating oil in nine working hours.

## SPECIFICATIONS IN BRIEF:

Motor: Four-cylinder, 3¼-in. bore by 5½-in. stroke. Protected overhead valves. Horsepower: 12 at drawbar, 20 at belt-pulley. Length: 96 inches. Width: 50 inches. Weight: Less than 3200 pounds. Turning Circle: 12 feet. Track: Length (each side) 50 inches, width 6½ inches. Traction surface: More than 600 square inches. Center to center of tracks: 38 inches. Clearance: 12 inches. Belt Pulley: Diameter 8 inches, face 6 inches. Suspension: Three-point. Heavy duty roller bearings throughout. 1800 pound drawbar pull.

The Cleveland Tractor not only saves time and labor—it does work cheaper and better. It makes possible larger and better crops. It enables you to do your part for the government and make money for yourself.

Does not pack the soil: Works on all kinds of farm land. Pulls a six horse load and moves 50 per cent faster. Operates successfully on 20 to 25 per cent grades.

Present Price \$1495 F.O.B. Berkeley July 1st Price \$1600

## HAY

Quotations by Nichols-Loomis Com-  
pany. Prices to growers f. o. b. L. A.  
carlots:  
Tame Oats .....26.00@28.00  
Volunteer Oat .....14.00@16.00  
Wheat .....23.00@26.00  
Barley .....23.00@26.00  
Alfalfa .....18.00@20.00

Quotations furnished by California  
Alfalfa Growers' Association, Riverside,  
California.

Number 1 alfalfa hay is \$23.00 per ton  
f. o. b.; common shipping points take a  
\$1.50 carload rate to destination. Prices  
from points where a higher or lower rate  
applies to destination will be correspond-  
ingly lower or higher.

## GRAIN AND FEEDSTUFFS

With new barley harvesting on in the  
Imperial it is probable prices on all  
grains may be established soon but as  
yet only chaos obtains and only individ-  
ual barter can determine price of the  
feeds or grains.

## San Francisco Markets

San Francisco, May 21, 1918.

### BUTTER

The quotations on butter are on the  
basis of solid packed cubes. To ascer-  
tain the market price of butter in  
squares, add to the cubes basis price per  
pound, as follows:

Two-pound squares, parchment wrap-  
per, ¼c; 1-pound squares, parchment  
wrapped, 1c; 2-pound squares, in cartons,  
1½c to 2½c; 1-pound squares, in cartons,  
2c to 3c.

Dairy Exchange quotations, lb.:

HAY

Under date of May 18, Scott, Magner & Miller says:

Receipts past week, 826 tons. The high price of feed for the past year with the prospect of high prices for the coming year has caused a great many feeders of hay to change their equipment into motor vehicles with the result that they are now buying gasoline instead of hay and feed. Although at first this did not seem to affect the sale of hay to any great extent it is now becoming quite noticeable. Reports of the coming hay crop in most sections are very discouraging although the cool weather of the last few weeks has been most beneficial and has increased the yield both of hay and grain considerably. Owing to government regulations of the hay business we believe that there will not be as much buying done by dealers in the country early this season as has been done heretofore. Farmers will probably carry more or less of their hay through the winter.

We quote today wholesale prices in carload lots as appear from dealer's transfers upon the hay market — for prices to consumers charges of cartage, commission and handling must be added according to conditions:

Fancy Wheat Hay  
(light 5 wire bale) .....27.00@28.00

Citrus Fruit Market

Los Angeles, May 22, 1918.

Prices which are almost sensational are prevailing in nearly all markets. Owing to shipping conditions and limited supply, number of shipments are not up to normal. As may be noted by totals of shipments given below, this season's output is materially less than half that of last year.

Lemon output is also greatly reduced but this lack is made up in large part by foreigners.

Shipments

Shipments of citrus fruits to date since November 1, 1917: Southern California; oranges 9374, lemons 2708, total 12,082. To same date last season; oranges 24,583, lemons 4214, total 28,797. Central California this season; oranges 2482, lemons 115, total 2597. Last season to same date; oranges 4069, lemons 164, total 4233. Northern California; oranges 203, last year same date, 845.

BLOCKING OSTEND

Continued from Page 655

"Engineer Lieutenant Commander Bury also was severely wounded.

"Most of the casualties were incurred while the ship was being abandoned. The men behaved with just that cheery discipline and courage which distinguished them in the Zeebrugge raid. Petty Officer Reed found Lieut. Alleyne in the conning tower still unconscious and carried him aft under a storm of fire from machine guns. Lieut. Alleyne was badly hit before he could be got over the side and fell into the water. Here he managed to catch hold of a boat and a motor launch under Lieut. Bourke succeeded in rescuing him and two other wounded men.

"The remainder of the crew was taken off by a motor launch under Lieut. Geoffrey H. Drummond, under a fierce fire. When finally he reached the Warwick the launch was practically in a sinking condition; her bows were shot to pieces. Lieut. Drummond himself was seriously wounded. His second in command, Lieut. Gordon Ross, and one hand were killed.

"All was according to program. Recall rockets for the small craft were fired from the flagship at 2:30 a. m. Great red rockets whizzed up, to lose themselves in the fog. They could not have been visible half a mile away, but the work was done and one by one the launches and motorboats commenced to appear from the fog and stopped their engines alongside. The destroyers exchanged news with them. There were wounded men to be transferred and dead men to be reported. But no one had seen a single enemy craft. Nine German destroyers which were out, free to fight, had chosen the discreeter part. The casualties, as at present reported, stand at two officers and six men killed; two officers and ten men, all of the Vindictive, missing, and believed killed, and five officers and eight men wounded.

"It is not claimed by the officers who carried out the operations that Ostend harbor is completely blocked. But its purpose to embarrass the enemy and make the harbor impracticable to any but small craft, and for dredging operations difficult, has been fully accomplished. The position of the Vindictive is with stem on to the eastern pier and not her stern, as shown in certain published illustrations."

This is the number that used K-W Magnetos as standard equipment—the list including 39 of the leading manufacturers.

This year already 40 of America's leading tractor manufacturers have specified K-W Magnetos as standard equipment on 83 models.

And why? Not because they are cheaper, because K-W Magnetos do cost tractor manufacturers more than any other make, but because these 40 manufacturers realize that the severe operating conditions common to tractor service demand K-W Magnetos. Their experience has proven that K-W Magnetos have the stamina to stand up under the most gruelling service.

## High Tension MAGNETOS

give the hottest known spark—timed accurately. They fire leaner and poorer mixtures and develop maximum power out of every drop of fuel used. Their construction protects them against water, dirt and oil. Their use eliminates troublesome starters and batteries.

In buying your new tractor insist upon a K-W Magneto. Look for the K-W trade mark.

Write for list of K-W equipped tractors and literature describing K-W Magnetos.

## France Must Get More Bread-Stuff

American Shipments Only Two-thirds of Barest Requirements

AMERICA must do more toward reducing the domestic consumption of cereals and increasing of exports to France," declared Andre Tardieu, French high commissioner to the United States, in an address delivered before the Southern Commercial Congress, in Baltimore, March 18.

"You must do it because it is a case of necessity, because it must be done. For these past three months the shipments of cereals from America to Europe have been short one-third of the supply recognized as indispensable to strictly compressed needs."

### Privation and Economy

The bread ration of the French soldiers has been cut from 25 ounces to 21 ounces, the civilian bread card allows ten ounces per day, which is about one-third of the average bread consumption of the French peasant or workman. The manufacture of crackers and pastry has been absolutely prohibited.

Consumption of sugar has been reduced 49 per cent and of rice 61 per cent. The import of dried vegetables has been reduced 52 per cent and of fats 48 per cent.

### Forced to Kill Cattle

Feeding of horses and cattle on cereals which could be saved for the making of bread has been prohibited. This, with the lack of other feed-stuffs, hay and fodder, resulted in a decrease of 50 per cent in the number of horses in France and in an important reduction of cattle. With almost no feed for their cattle the French were forced to place them on the market as meat. This meant the suspension of meatless days and an attempt on the part of the people to make up for the lack of bread with an increase of the meat portion.

### Some Districts Without Bread

"The people who have imposed such sacrifices upon themselves," said M. Tardieu, "are a people who have kept fighting for almost four years—a people who have mobilized 7,000,000 men from a population which, excluding the invaded territories, does not exceed 35,000,000 inhabitants, a people whose women and children have taken the burden of industrial and agricultural work left by the men who joined the army, a people whose army lost over a million men in killed, whose army, nevertheless, is still holding, with an unconquerable steadfastness, over two-thirds of the western front."

"Within the last weeks, despite the restrictive measures I have stated, there have been in France agricultural districts which had for days to put up with a complete, absolute deprivation of bread, a situation which could not go on without endangering the physical and moral health of the nation."

### America Must Share Suffering

"I am aware of what you have done in order to reduce your domestic consumption and to increase your exports. But you must do more. You must do it, for it is a case of necessity. You must do it because it can be done."

"We and our European allies, the British, the Italians, have been taught to suffer. Americans, who are now sharing our burden of blood and of death on the battle line, we are requesting you to share as well, in the rear, our burden of suffering. In order that you and we may win the war, it is necessary that you here in America should all agree to a new effort and to new privations."

## Various Liberty Bond Issues

There are at present issued and outstanding four issues of Liberty Bonds, and soon there will be six issues. They are as follows:

1. The original bonds of the First Liberty Loan; these bear 3½ per cent interest and mature June 15, 1947, but are redeemable at the government's option on or after June 15, 1932. They have a conversion privilege.
2. The original bonds of the Second Liberty Loan; they bear four per cent interest and mature November 15, 1942, but are redeemable at the government's option on or after November 15, 1927. They have a conversion privilege.
3. Bonds of the second issue which have been obtained by the conversion

of bonds of the first issue into bonds of the second; they bear four per cent interest and mature June 15, 1947, but are redeemable on or after June 15, 1932. They have a conversion privilege.

4. The original bonds of the Third Liberty Loan; they bear 4½ per cent interest and mature September 15, 1928, and are not redeemable until maturity. They have no conversion privilege.

The other two issues which will soon be outstanding will be 4½ per cent bonds obtained by the conversion of bonds of the first issue, and 4½ per cent bonds obtained by conversion of bonds of the second issue, into bonds of the Third Liberty Loan. They will have no conversion privilege.

## Debts of the Warring Nations

The London Economist for February places the total gross debt of Great Britain at 5,678,600,000 pounds (\$27,636,000,000).

The French minister of finance in presenting the budget for 1918 estimated the public debt of France on December 31, 1918, at 115,166,058,000 francs (\$22,227,000,000).

The public debt of Italy at the end of 1917 is estimated at about 35,000,000,000 lire (\$6,676,000,000).

The debts of the Central Powers are estimated as follows: Germany, \$25,408,000,000; Austria, \$13,314,000,000; and Hungary, \$5,704,000,000.

Our own public debt is now around \$8,000,000,000, but more than half of this amount has been loaned to our Allies and will be repaid us. It is estimated that of the total net expenditures of the United States for the fiscal year of 1918, exclusive of

our advances to our Allies, more than one-half will be defrayed by taxation.

### The Eggs You Didn't Get

How can you expect a hen to lay 150 eggs a year or even 50 eggs if her vitality is sapped by lice and mites—all she can do is itch and fret and cost you money.

EGG LAYING CONTEST AT MOUNTAIN GROVE

By T. W. Noland, Director, Missouri Poultry Experiment Station

As the restriction the government placed on the sale of hens and pullets expired on May 1, it is well to cull your flock and sell all hens that are overly fat and the ones that have been loafing on the job. Keep your layers until the moulting season at least, then select your breeders for next season.

May is a good month to hatch chicks. If you haven't the number you expect to raise, continue hatching through this month. Pullets hatched in May and properly raised can be brought into laying condition before winter.

Look for lice on young chicks, especially the ones brooded with hens, for if you haven't treated the hens for lice before placing them with the chicks, you will experience trouble. Lice cause the death of more chicks when brooded with hens, than do diseases. Go over the hens, grease them with equal parts of vaseline and blue ointment before placing chicks with them.

Chicks to be transferred to colony houses should be brought up to the change gradually by keeping less heat in the brooder house, raising windows, then letting the fire go out. Make the change on warm days. Watch the chicks closely for a few nights to see that they do not "pile up." Train them to go on the roost by placing some on the perches and the rest will soon follow.

Entries are now being received for the eighth egg laying contest. The contest will be limited to 60 pens composed of four pens each of 15 varieties.

**The Contest**

Pen 36, S. C. White Leghorns from Missouri won the cup for April with a record of 126 eggs. The total number of eggs laid in April was 6216 or an average of 20.7 per hen.

The following are the leading pens for each variety:

S. C. White Leghorns, Missouri, 126 eggs; W. P. Rocks, Illinois, 125; Ancona, Missouri, 125; W. P. Rocks, Idaho, 125; R. I. Whites, Michigan, 123; W. Wyandottes, Illinois, 121; Silver Wyandottes, Iowa, 120; Buff P. Rocks, Missouri, 119; R. C. Reds, Missouri, 118; Barred P. Rocks, Missouri, 116; Barred P. Rocks, Michigan, 116; S. C. Reds, New Jersey, 114; Buff Wyandottes, Missouri, 113; S. C. Brown Leghorns, Missouri, 112; Buff Orpingtons, Missouri, 108; Black Orpingtons, Indiana, 102; White Orpingtons, Missouri, 87.

**SWAT THE ROOSTER!**

"Swat the Rooster!" is a slogan which should be adopted by every poultry raiser during the summer months, for absolutely millions of dollars worth of market eggs are spoiled every summer because they are fertile, and the poultry raisers are losing this tremendous sum each year.

If you have a good male bird, you wish to keep over for another year, place him in a pen with a few hens and he will be much better as a breeder another season. Separate these birds from the flock of layers and use the eggs from them at home. Show your patriotism by helping Uncle Sam save on the foodstuffs of our country by "swatting the rooster" and marketing infertile eggs!

Keep a lookout for broody hens. If you do not want the hens to set, place them in broody coop and provide plenty of feed and water, and it will be but a few days until they will be producing eggs. Don't allow any loafers to remain in the flock, but keep your hens in condition to do their "bit" toward supplying food for a hungry world.

**HENS SHOULD NOT BE HURRIED TO MARKET**

"A rush of too many fowls to market as soon as the restriction against selling laying hens is removed, may result in food losses," says the United States department of agriculture. "Think twice before selling a hen that is still laying. Green food is becoming more plentiful and the demand for eggs continues. Universal marketing of fowls may react on prices as well as cause spoilage of dressed poultry."

No Market for Chicken Lice

Feed is too scarce and expensive and poultry meat too valuable to be wasted by lice and mites. These animals have no market value, and each year they cause the death of thousands of chickens and hens.

The chicken mite lives in cracks and crevices of the poultry house during the daytime and visits the chickens to suck blood during the night. The ravages of mites can, therefore, be checked by frequently cleaning the house and spraying or sprinkling with an insecticide. Kerosene, crude oil, or a coal-tar wood preservative may be used for this spray. Ten per cent crude carbolic acid added will increase the effectiveness. Begin spraying early in the season and continue at least once each month during the hot weather.

Poultry lice live continually on the hen's body, which must be treated if they are to be killed. This may be done by use of a lice powder well worked into the feathers or by applying mercurial or "blue ointment" mixed with an equal amount of vaseline, under the vent, under each wing, and at the base of the neck. "Blue ointment" can be bought at drug stores. A few ounces will treat a large flock. An amount the size of a pea will treat a mature fowl or five to eight growing chicks. For very small chicks, lard, vaseline, or meat fryings can be more safely used. Effective treatment for lice and mites must begin at once before the hot summer weather favors their increase by the thousands.

**MAINTAINING POULTRY MARKET**

Producers have often felt that the food administration was engaged in depressing the market and favoring

the consumer, but there are other times, as indicated by this report in daily press of the action of Los Angeles' food administrator:

Ten days ago, according to Mr. Cole, a group of men invaded the local market and after buying up a large stock of poultry in the near vicinity proceeded to unload it on the local market, at a price considerably less than the quotations had been or would be until the first of next month.

Thursday afternoon, Mr. Cole summoned all the large wholesale poultry dealers of Los Angeles to his office where all angles of the question were threshed out. While nothing is known of the exact means whereby an agreement was reached, yet Mr. Cole announced yesterday that every large poultry dealer in Los Angeles had agreed to return to the fixed price, until June, in order that the many producers of poultry who had laid in a large stock of brooders would not suffer a severe loss.

Which rolls the easier

the perfectly round steel ball in the tread of the Yuba or the irregular tread of the old ox-cart?

Which is the freer from friction? Which carries the heavier load? Which travels faster? Which is your choice for the work you must do?

Scientific knowledge is that which has been demonstrated and proved by tests. In proving the Yuba Ball Tread idea, there were first the engineering experience of the inventor, then the combined experiences of our corps of trained and efficient engineers, who had for years been building gold dredges, one of the world's most costly machines.

Then followed for the tractor four years of the hardest kinds of tests by farmers and contractors under severe conditions, theretofore considered impossible of accomplishment, proving the ball tread to be scientifically correct.

A Yuba Ball Tread Tractor in your possession means reduced cost of operation, deeper, wider furrows, and greater satisfaction all around.

## True Tire Economy

The most economical tires you can buy are

First—Tires that will travel the greatest number of miles per dollar of cost.

Second—Tires that will give you the greatest use of your car.

United States Tires are long mileage tires. They reduce your tire expense by the mile and by the season.

United States Tires are sturdy tires. They are built for endurance. They will give you continuous, uninterrupted service enabling you to get the most out of your car.

Both factors are more than ever important in these times of war.

Economy is a national duty,

—the nation demands utmost service from every car,

—the country is calling on every farmer to further increase his magnificent efforts of last year toward supplying food for the World.

Equip with United States Tires. There is a United States type and tread to suit every car, every road, every service.

The nearest United States Sales and Service Depot will be glad to help you in selecting right tires for your needs.

*For passenger cars—'Chain', 'Usco', 'Royal Cord', 'Nobby' and 'Plain'. Also tires for Motor Trucks, Motorcycles, Bicycles and Aeroplanes.*

*United States Tubes and Tire Accessories Have All the Sterling Worth and Wear that Make United States Tires Supreme.*

# Mutual Fire Insurance in California

By C. B. Messenger

HERE are now 20 farmers' mutual fire insurance companies in California. Some of these are very small, carrying little more than \$100,000 total business, and one is carrying an aggregate of over \$10,000,000.

The organization of these insurance companies began in 1898 under the act of 1897. At first their business was confined by the act under which they were organized strictly to farm buildings. As farm buildings, usually without any fire fighting appliances within reach, are considered an undesirable risk by the old line companies, the rate made necessary, while materially under the old established company rates, was still higher than it should have been. Revision of state laws was secured which permitted taking business in incorporated cities. This business, however, is restricted to \$4500 total risks carried in any one city block. Likewise the largest one risk which may be carried is \$4500. This enlarging the field added strength to these mutual companies and is permitting of proportionate reduction in operating costs.

Most of these organizations are believers in "safety first" and are carrying a reserve which will meet even an abnormally large loss. The management of some of the associations, however, has considered that the reserve of membership is sufficient. In that case each member carries his own reserve as he sees fit, then in case abnormal loss does come, assessments are made.

The Ventura County association suffered severe losses little more than a year ago which compelled it to secure large loan at bank in order to promptly meet losses of its members in the great Ojai Valley fire.

The Los Angeles County association is carrying the largest reserve, now around \$32,000. Compared to the \$10,000,000 business which it is carrying, even this might be considered small by old line companies, but when it is considered that its risks are so widely separated and in every case of limited amount, it is seen that its reserve is entirely within safety limits. This fund is largely in savings banks, though a large-sized chunk of it has been invested in Liberty Bonds. Insurance of packing

houses or other large properties along railways is prohibited.

While these companies have been managed by farmers or at least in every case by people of no experience in insurance matters, it is astonishing that their success is as great as it has been. As years of experience are added and the method of handling large business propositions is more fully understood, these associations will be able to render far greater service.

These county associations have found it necessary in order to secure best of service to have a connecting link and have united in forming a state association. This association is not a business organization in any sense; merely an association in which the county corporations affiliate for the sake of protecting and advancing their own interests.

Again, state interests call for a still larger organization to look after national interests, hence the National Association of Mutual Insurance Companies, of which Harry T. Cooper of Crawfordsville, Indiana, is the secretary. The secretary of the California state association is George F. Cromer, who organized and is still secretary and manager of the Los Angeles County Mutual Association. Mr. Cromer is also California vice-president in the national association.

One reason for a purely mutual insurance is brought out in evidence given by the president of one of the largest insurance companies in New York before the New York insurance commission. This official frankly admitted that an extra fire now and then was really desired by the old line companies; it increases business. Here are his words:

"I don't care anything about a \$2,500,000,000 or a \$3,000,000 fire. Just as soon have it as not. It would put so much business on my books, and put rates so high, I would make it up."

Now while there is no question whatever as to the integrity of most of the great insurance concerns of the country it is not good business to continue a condition which calls for a loss to state and nation in order to benefit any private business. With a purely mutual organization there is no such inducement for increased business.

At a recent meeting of the Illinois

state association Insurance Commissioner Potts of that state said:

"As supervising insurance officer of your state I had the records of my office searched yesterday to find out whether anything was wrong with the farmers' mutuals of Illinois. This disclosed that not one complaint has been sent to my department and that there is not a single blemish on their record. I am obliged to say this is not true of every other form of insurance which has been under my supervision.

"Cooperation is the thing necessary for all of you. Sixty per cent of the selling price to the consumer of everything produced by you—that is the cost to the man who eats it at the table—goes to middle men. You have done better and fulfilled your purpose more completely in fire insurance than any other form of insurance organization in the world. If you can run fire insurance companies on a cooperative basis, you can cooperate in other ways."

Cooperative fire insurance is about the oldest form of cooperation in this country.

The first fire insurance companies of any kind organized in the United States were mutual companies, the first being the "Philadelphia Contributionship," formed February 18, 1752, of which the great patriot, Benjamin Franklin, was a founder. This company, however, after some unfavorable experiences, decided that it would no longer insure houses which had trees in front of them, because these made it more difficult to fight a fire. Consequently, in 1786, the "Mutual Assurance Company" was organized to insure houses with trees in front. Both of these companies are still in existence and doing business. Following this there were numerous fire insurance companies organized, both joint stock and mutual, in the United States.

These associations are all organized under the same state law. Their books are open to members, and the business is under the absolute control of the state insurance commissioner who makes periodical examinations of the books and the general conditions.

From the booklet of the Los Angeles County Association we quote regarding its business:

"Insurance in the hands of large

stock companies has been perverted from its true mission and become a means of amassing great wealth for capitalists and salaried officers—extracting from the insured, as statistics show, premiums at least double the sum paid for actual losses.

"That the citizens of our county may furnish their own insurance at actual cost, and yet with the highest possible security, is the object of this company, and the plan adopted is no new experiment, having been operated with most gratifying results for the last 120 years in the Eastern states.

"Since we have been organized, agents of the old line insurance companies have been profuse in their predictions that 'its life would be short,' 'would be more expensive,' and even endeavored to make some innocent persons believe that they would be 'assessed' until they lost their homes.

"But the actual experience, which is the crucial test, proves that notwithstanding their false predictions and the many misrepresentations to which we have been subjected, we came to stay and have furnished the best and safest insurance at one-third the rates of stock companies and at a saving of \$300,000 in 18 years.

"We have been organized 18 years, never made an assessment, and have \$28,000 cash in the treasury.

"By a united effort a mutual law was secured in California, March 1897. Under that enactment 20 companies have organized, carrying about \$60,000,000 worth of risks at an average cost of \$2.00 per \$1000 per year.

"So few counties having availed themselves of this provision, for the purpose of making a comparison and demonstrating erroneous conclusions, it will be necessary for us to go to other states and counties for statistics in this matter.

"In the forty-fourth annual report of the insurance commission of the State of Iowa, he makes the following comment in regard to the success of Farmers' Township Mutuals in that state:

"The business written by the Farmers' Township Mutual Fire Insurance for the year 1912 largely exceeded that of any other single year in the history of this class of companies. The total amount of insurance in force at the end of the year exceeded \$400,000,000. The total cost

## Farmers Mutual Fire Insurance Companies of This State

Farmers Mutual Fire Insurance Company of Mendocino County at Fort Bragg, Arvid Nelson, Secretary, Fort Bragg. Risks carried on December 31, 1916 when last report of insurance commissioner, Alexander McCabe was issued amounted to \$58,606.75.

Farmers Mutual Fire Insurance Company of Turlock at Turlock, John A. Orr, Secretary, Ceres. Risks carried amounted to \$2,043,880.00.

Farmers Mutual Fire Insurance Company of Yolo County at Woodland, J. D. Musgrove, Secretary, Woodland. Risks carried amounted to \$1,400,460.83.

Farmers Mutual Protective Fire Insurance Company of San Joaquin County at Stockton, E. H. McGowen, Secretary, Stockton. Risks carried amounted to \$2,244,577.00.

Hilmar Mutual Fire Insurance Company of Merced County at Hilmar, A. A. Anderson, Secretary, Hilmar. Risks carried amounted to \$568,957.00.

Humboldt County Fire Insurance Company at Ferndale, A. W. Blackburn, Secretary, Ferndale. Risks carried amounted to \$1,212,457.00.

Lake County Farmers Mutual Fire Insurance Company at Lakeport, H. S. Davidson, Secretary, Lakeport. Risks carried amounted to \$249,950.50.

Los Angeles County Mutual Fire Association at Los Angeles, G. F. Cromer, Secretary, Los Angeles. Risks carried amounted to \$8,935,692.00. Since this report was made out more than a million dollars has been added, and today this county is carrying in excess of \$10,000,000. Without question the other counties have made a similar increase.

Napa County Farmers Mutual Fire Insurance Company at Napa, E. H. McMillan, Secretary, Napa. Risks carried amounted to \$446,448.00.

Orange County Farmers Mutual Fire Insurance Company at Santa Ana, C. W. McNaught, Secretary, Santa Ana. Risks carried amounted to \$5,702,295.14.

Patrol Mutual Fire Association of Tulare County at Tulare, W. E. Anderson, Secretary, Tulare. Risks carried amounted to \$724,261.00.

Sacramento County Patrons and Farmers Mutual Fire Insurance Company, Joseph Holmes, Secretary, Sacramento. Risks carried amounted to \$1,187,615.00.

San Bernardino County Mutual Fire Insurance Company at Ontario, John N. Huehn, Secretary, Upland. Risks carried amounted to \$5,555,333.00.

Santa Barbara County Farmers Mutual Fire Association at Santa Barbara, C. B. Husted, Secretary, Santa Barbara. Risks carried amounted to \$1,160,328.

Santa Clara County Fire Insurance Company at San Jose, Ella A. Taylor, Secretary, San Jose. Risks carried amounted to \$2,081,074.00.

Scandinavian Mutual Protective Fire Insurance Association of Fresno County at Kingsburg, Nicholas G. Nelson, Secretary, Fresno. Risks carried amounted to \$6,291,089.00.

Sonoma County Farmers Mutual Fire Insurance Company at Santa Rosa, John M. Given, Secretary, Forestville. Risks carried amounted to \$3,632,331.00.

Ventura County Mutual Fire Insurance Company at Ventura, L. P. Hathaway, Secretary, Ventura. Risks carried amounted to \$3,225,999.55.

to the members on each \$1000 of insurance for the year was but \$2.00. This rate proves to be the average cost to the farmers over a period covering the years from 1878 to the close of 1912.

"The average cost in town mutuals was \$1.30 per \$1000.

"The report of the insurance superintendents of all states for the year 1918 is about the same.

"This result, taking into consideration that these companies are managed by men not experienced in underwriting, and in nearly every instance by men who give their time and attention to other pursuits in life, is remarkable. This could not have been attained had not the most rigid economy been practiced and the most careful selection and inspection of risks been exercised.

"E. H. Ohlendorf, secretary of

Pottawattamie County Farmers' Mutual of Council Bluffs, Iowa, writes:

"No purely mutual insurance company in the State of Iowa has failed to my knowledge. The company for which I am secretary has done business since 1878. Our average assessment has been less than 20 cents a hundred. This includes losses to live stock by lightning, something that farmers in California have not to contend with."

international law by dropping bombs on Red Cross hospitals. Many nurses and wounded men were slaughtered.

The British recruiting officers operating in America are endeavoring to secure a large number of Jewish volunteers for work in Palestine. Men of Jewish birth between the ages of 18 and 45 are desired.

The hundred million dollar Red Cross drive ended on Monday with the hundred millions vastly oversubscribed. How much over we are unable to say, but the boys in front are informed that the folks behind are not so far behind after all.

It is possible the new draft will include men to 55 years of age; men from 21 to 40 for active field service and over 40 for duty back of the lines. This will include mechanics, artisans and department workers. It is estimated that there are seven and a half million between the ages of 40 and 55.

British armed merchant troopship Moldavia was sunk last Saturday. It was filled with American troops, 56 of whom are reported missing. The missing men were largely those who were amidships and in hammocks on lower deck, and it is thought they were killed by explosion, for escorting ships saved the great majority of the men aboard.

Careful comparison of submarine activities for April, 1918, compared with those of April, 1917, shows sinkings this year less than one-third those of last year. It is now known that the submarines are being destroyed much faster than they can be built; also that the sinking of Allied vessels are at no time now equalling the launching or commissioning of the new vessels.

The German control and peace measures in various provinces of Russia are resulting in greater number of deaths and greater suffering than when Russia was in most strenuous war activities. During the past week it has been thought that faint promise of Russia's recovering herself was being made. It was rumored that Kerensky had landed in this country and that the few military leaders who have not been murdered were gathering the nucleus of a new army, but the only hopeful development has been that the increasing unrest is creating a more difficult situation for the Huns.

The long expected drive on the Western front began at dawn Monday morning. The outposts of the Allies were driven in and a few trenches were taken, but nearly all recovered in counter drive. The massed form of making the charge is still continued by the German troops and efficient machine gun fire is taking terrible toll. The charge was preceded by many hours of artillery fire and a deluge of gas shells. The Allies are now given a great advantage in having a superior air squadron. The charge is being made in two sections, the longest covering a 40 mile front in the Rheims sector with Paris as the objective; the other, along a line of much shorter frontage, farther north and with the seaports of Dunkirk and Calais as objective.

# A Message to Live Stock Breeders

By Private Stonerod, Battery C, 144th F. A., Camp Kearny

Cultivator readers who have come in contact with one of our former live stock field men, F. F. Stonerod, will be interested to have this word from him. He is now in the service of his country.

In addition to his work with the Cultivator, Mr. Stonerod assisted C. R. Thomas in planning the work of the live stock department of the Liberty Fair when that fair was under contemplation last fall. As Mr. Stonerod has had experience at both the Pacific International and the P. P. I. E., where he was aide to D. O. Lively, his suggestions as to California fairs have force.

OUR great commander-in-chief, President Wilson has so wisely said, "It is a privilege to live in this day and time and to take some active part in the fight for the liberation of mankind, and the cause of democracy."

Whether it be in the trenches, in the training camps, the home, the farm, or the office, the vast majority of Americans have during the past few months realized the gravity and magnitude of the world war and have combined to make our part in it worthy of our most sacred traditions.

The slogan that "Food will win the war," could not have been more appropriately chosen. Without the support of the American farmer on the one hand and the consumer on the other, adequate supplies to American and Allied forces in the field and populations in the different countries would never be possible. Through the efforts of Herbert C. Hoover and the food administration the critical situation at home and abroad was relieved, but we must never relax our energies in the slightest degree if we are to keep pace with the always increasing demands upon our resources.

California has fulfilled expectations to date in the food crisis. Her wonderful possibilities as an agricultural state were never so apparent. Meats, breadstuffs, minerals, fruits, she has poured into the yawning cavity of the world's bread basket, and this year she will do even better.

With these truths in mind, and with the idea of increasing production through the medium of the modern methods of intensive agriculture, the Liberty Fair Association of California, has planned a great exposition of the

state's resources and industries and has appropriately named it, "Liberty Fair." It will be held October 12 to 26 inclusive, in the beautiful and spacious new buildings at Exposition Park, Los Angeles.

The writer's intimate acquaintance with the agricultural and live stock industry of California leads him to believe that the farmers and breeders will make a special effort to make these the most important features of the fair, and thereby a big winner through the medium of their support. Certainly it will be a great mistake on their part if they do not show their products and their flocks and herds to the thousands of visitors who will pass through the gates.

Exhibits of this character are primarily educational. In comparing field crops and animals we demonstrate the fallacy of trying to produce inferior crops and animals at a time when the cost of maintenance is the highest ever known, therefore these departments of the fair will be worth many times their cost.

Favored by location, climate, and soil, this state is destined soon to be the greatest section in the world for the production of live stock, as it is, now, the richest in agriculture. Our sterling breeders have already produced many world-record individuals, and from henceforth the greatest need is increase in the number of the utility types of cattle, hogs, and sheep, and forage for their development.

From my place in the ranks at our big southern training camp, I view with amazement the vast quantities of foodstuffs necessary to keep a large body of men and animals in trim; and this is but one division, a drop in the ocean of the thousands that go to make up the enormous army which is planned to carry the war to a success-

ful conclusion. Fats are most vital to the existence of the race. The slightest decrease below a certain point in the food calories required to keep a fighting man in trim in a short time becomes disastrous. We are a meat eating people, and if the great Liberty army is kept supplied with this product and the needs of our Allies are looked after there can be no doubt as to the final outcome of the war no matter how long it lasts.

And so I would convey this message to the farmers and live stock men of California. Bring out your best products to the fairs this year. Make a particular effort to show the world what California is doing in one of her richest fields. Compete, compare, rival each the other, and if you will but keep in mind the educational feature of these exhibitions, the beginner will soon want to know how much it costs to produce a certain crop, or pound of beef, or pork, or mutton, and why the pure bred sire is better than the scrub; the farmer who has failed because he was unfamiliar with our practical and successful methods will want you to give him the results of your experience. Come prepared to answer and thus do your bit. Support the Liberty Fairs this year as never before.

## This Week's War Notes

There is rather more activity along the Italian front but no well sustained attack.

Mexico has severed diplomatic relations with Cuba. Presumably this is because of German intrigue.

The war department is preparing to manufacture a vast number of large seige guns to be used in levelling fortifications in the drive on Berlin.

America's transports are making good. "There will be a million men in France by July" is thrilling all the country to swifter and swifter action as manifested in every department.

Hun aviators Sunday night violated all considerations of humanity and

**Saturday, June 1, 1918****OUR ADVERTISERS RELIABLE**

We guarantee our subscribers against  
 loss through dishonesty of any adver-  
 tisers in the Cultivator. We do not at-  
 tempt, however, to adjust trifling differ-  
 ences between subscribers and honest,  
 responsible advertisers, nor will we pay  
 the debts of honest bankrupts. Notice  
 of complaint must be sent us within 30  
 days from date of the transaction, and  
 the subscribers must have mentioned the  
 Cultivator when writing the advertiser.

**THIS WEEK'S COVER**

The California Cultivator has  
 often appealed for more general tree  
 planting, especially through the great  
 valley of the state. No tree gives  
 such magnificence and, at the same  
 time, usefulness as the wonder tree,  
 eucalyptus. Less than 30 years ago  
 the seed for the tree shown on this  
 week's cover was planted. This  
 photograph was taken a year ago.  
 Twelve years ago it was 112 feet high;  
 nine years ago, 120 and with a spread  
 of bough of 88 feet; today its circum-  
 ference is over 18 feet, and it is add-  
 ing to its girth from six to ten inches  
 yearly. It is the Eucalyptus viminalis,  
 next to the globulus the most  
 rapid growing of these wonderful  
 trees. This specimen was planted by  
 J. C. McCubbin and is still on his  
 place near Reedley close to the line  
 between Fresno and Tulare Counties.

**JURY TRIAL**

As a war measure let us post-  
 pone jury trials. Mind, we do not say,  
 discontinue them, but let the man who  
 wants a jury trial await the ending  
 of the war. War demands the best in  
 every man, and every one of us who  
 has served on an ordinary jury finds  
 little opportunity for manifestation of  
 the best that's in us. In any case,  
 right now we need potatoes more than  
 we do jury trials.

**GO TO WORK**

We imagine the Cultivator does  
 not appeal to very many of the idle  
 rich through its editorial page, so we  
 may all enjoy a bit of a hit at that

class by referring to the fact that no-  
 tice is being served on every one who  
 has ability to work that he's got to  
 get busy. Word has been sent from  
 Washington; "Go to work or go to the  
 trenches." There has been a sugges-  
 tion that 60 years shall be the limit,  
 but why leave out a lot of those fel-  
 lows that are just reaching efficiency  
 age? It is unfortunate that there  
 are those who neither toil nor do they  
 spin.

**GOING TO THE FAIR?**

It is none too early to ask read-  
 ers of the Cultivator regarding plans  
 for the coming fair. It will be held  
 here, there and everywhere, and the  
 various dates are from late August  
 until December, but while it is not  
 time to fill up the gas wagon for the  
 start to the fair, it is time to consider  
 the exhibit which may be made. The  
 best horse or cow or hog, sheaf of  
 wheat or piece of fruit which can be  
 grown on the ranch should be taken  
 to this year's fair. It is a time when  
 the impetus of rivalry may well be  
 used to induce ourselves to produce  
 more and better. Have the fair in  
 mind and take something at least.

**GOOD-BY**

Speaking of the exclusion of  
 German from the public schools in  
 this country, we note that in Germany  
 definite government order has been

**SAVE THE GRAIN**

Congress proposes to stop de-  
 struction of food grains in the making  
 of our toddy which lowers efficiency.  
 German owned breweries in this coun-  
 try have been charged with destroy-  
 ing more food in the production of  
 beer than have the German sub-  
 marines. A bill has been passed ap-  
 propriating \$11,000,000 to be used by  
 the president in food purchasing and  
 conservation. Now, sitting as a com-  
 mittee of the whole, the house has  
 voted, 69 to 58, an amendment prohib-  
 iting any expenditure of this fund un-  
 til the president shall have ordered  
 that no grains be used in the making  
 of beer. Congressman Randall of  
 California has said: "With an inten-  
 sive campaign of spying into flour  
 barrels and sugar bowls of every  
 family in America, the wholesale loss  
 of food through the operation of the  
 breweries, nine-tenths of whose pro-  
 duct is German-owned and made, be-  
 comes a positive scandal."

**PLAY FAIR**

When the boys are sent into  
 the trenches it becomes their duty to  
 draw a bead on the first Boche head  
 which appears on the other side of  
 No-Man's land. Likewise, it is his  
 duty to preserve his own life, if pos-  
 sible, for service of his country. We  
 who are behind the lines sustain him

**PREVENT THE FIRES**

The California state board of forestry, having in mind the great  
 losses which California annually suffers through the ravages of fire, de-  
 sires to impress upon the people of the state the great necessity of care  
 in the use of fire during the coming summer. Particularly at this time,  
 when the economic losses brought about by the war are the greatest the  
 world has ever known, should we all do everything in our power to lessen  
 the annual loss which fire causes. All the people of California should  
 remember how important it is that vegetation upon our water sheds be  
 protected in order that our subterranean reservoirs may be kept full.  
 To campers, to those who are making clearings, and to tourists who travel  
 through the mountain regions especially should the warning apply.—  
 William D. Stephens, Governor.

given that in bidding good-by at rail-  
 way stations or otherwise the use of  
 such words as adieu—which is French  
 —or other foreign language terms is  
 forbidden. There is no indefiniteness  
 in the order, for here is an exact list  
 of farewells from which the depart-  
 ing German may choose:

"Gott beschuetze Dich; Gott segne  
 Dich; auf wiedersehen; auf baldiges-  
 wiedersehen; auf sehrbaldigeswieder-  
 sehen, and auf ein rechtherzigesfro-  
 hesbaldigeswiedersehen."

**FARM ALLOTMENTS**

The state land settlement board  
 is now sending out its formal an-  
 nouncement of allotments which will  
 be made some time within ten days  
 after June 12. Applications may still  
 be made, but with this first parcel of  
 land to be allotted there are only 50  
 farms, and as there are several hun-  
 dred applications already in, other ap-  
 plications will only add to the difficul-  
 ties now before the board. We hope  
 the success of this land settlement  
 plan will result in other parcels of  
 California lands being subdivided.  
 Any other applications for these lands  
 must be made prior to June 12. Mean-  
 time, any one interested may secure  
 general information as to conditions  
 required by the land settlement act  
 by writing Land Settlement Board,  
 101 Agricultural Hall, Berkeley.

in every way possible and encourage  
 him to do his patriotic duty.

If he becomes tired and homesick  
 and of the opinion that he has served  
 his country long enough and "resigns"  
 from his job, he is promptly put up  
 against the wall and shot. "Serves  
 him right" is about the only comfort  
 his people on this side receive.

It is necessary to send food and  
 supplies to keep him well and active,  
 but there is a shortage of ships. We  
 are building more as rapidly as pos-  
 sible. The very life of the boys in the  
 trenches depends upon the early con-  
 struction of these ships. For some  
 reason, any old reason sometimes, the  
 builder decides to quit his job. Is he  
 any less guilty than the boy who de-  
 serts from the trenches? Common  
 fairness dictates the answer which,  
 unfortunately, does not seem to be  
 the true one when we consider the  
 method we have followed in both  
 cases. Let's be square with the boy  
 in the trenches.

In this connection, is it not timely  
 for American people to consider the  
 relationship of some Irish organiza-  
 tions and individuals in this country  
 to many of the treasonable acts which  
 have been committed? For our own  
 protection and for that of England,  
 one of our Allies, America should stop  
 these treasonable acts. While they  
 fight England they may be considered  
 enemies of the United States, but  
 when they ally themselves with Ger-  
 many there is no question. It is no  
 time for temporizing.

**COOPERATIVE INSURANCE**

When a farmer can get justice  
 in buying his goods or in selling his  
 products through the regular channels  
 of trade the Cultivator has believed  
 that these established agencies should  
 be used. The farmer's business should  
 be that of production, while the mer-  
 chant, who has made a life study of  
 his business, should be able to so  
 handle it that the producers can buy  
 and sell and still live. But selfish-  
 ness is still a factor in human nature  
 and it manifests itself unduly so often  
 that we have, many of us, been com-  
 pelled to look about for some method  
 we could use in self-protection.  
 Hence cooperation, at first so crude  
 that failure came oftener than suc-  
 cess. We have persisted, and today  
 thousands of farmers owe their very  
 existence to the principles of coopera-  
 tion which have been put into prac-  
 tice.

These principles have been worked  
 out in almost every phase of agricul-  
 tural endeavor, and in some cases  
 single organizations have been per-  
 fected that have handled millions. The  
 growth of cooperation has been  
 perhaps more rapid on the Pacific  
 Coast than in other sections of the  
 country. Only far-seeing people can  
 cooperate; they must be able to ap-  
 preciate the fact that a penny before  
 the eyes may hide many dollars a  
 few weeks or years removed.

One of the more successful of co-  
 operative efforts has been the hand-  
 ling of insurance. Cooperative frat-  
 ernal life insurance organizations  
 sprang up all over the country, at first  
 many failing because of lack of  
 proper observance of business princi-  
 ples, later succeeding admirably at  
 vastly less cost to the insured.

More recently came the farmers'  
 mutual fire insurance companies, of  
 which this state now has a score. The  
 effort has been to cut the cost of in-  
 surance into half that when carried  
 by the old line companies. This has  
 hardly been accomplished, for the cost  
 now is about three-fifths that of the  
 established board company rate, but  
 as some of these companies are find-  
 ing that their reserve is increasing  
 to a point where they are perfectly  
 safe as to any loss which may have  
 to be met, it is to be presumed that  
 the rate will be lowered.

The government is making a more  
 strenuous campaign against Sinn  
 Feiners and other traitors in this  
 country who are lead on and aided by  
 German sympathizers and German  
 gold. Many have felt that Irish sym-  
 pathizers in this country have been  
 emboldened by America's sympathy  
 for Ireland, but treasonable acts will  
 no longer be tolerated. John Dillon,  
 new leader of the Nationalist party,  
 has openly declared war on the Sinn  
 Fein.

Finland is now practically the kais-  
 er's. German rule has been accepted.  
 Prussian "business methods" are to  
 be installed for 20 years to come.  
 Finland is to be "permitted" to dis-  
 band all of her troops and Germany  
 will officer and raise other troops  
 should they be necessary.

Railway Director General McAdoo  
 has announced the advance in wages  
 for 2,000,000 railroad employees, the  
 order being retroactive, wages to be  
 gin-with January 1 last. This will  
 add \$300,000,000 to transportation ex-  
 pense.

# Agricultural News Notes of the Pacific Coast

## Northern California

The Glenn County farm bureau is organizing fire fighters.

A 10,000 acre rice tract in Yolo County is now being planted.

Placer County is organizing a farmers' mutual fire insurance company.

Sonoma County has organized a farm home department in its farm bureau.

Ord farm center meeting of the Glenn County farm bureau will be held June 4.

Peach growers of Butte County are holding for \$60 per ton, though best offers so far reported are \$53.

Farm Adviser Christiansen of Humboldt County is supplying 30 tons of potatoes to the war department.

Trinity national forest reports the first fire of the season, which was easily controlled by forest rangers.

Sheridan Center of Placer farm bureau wants to get rid of 1000 jack rabbits and is organizing for a rabbit drive.

It is estimated that grain fires in this state cause an annual loss of \$500,000. In almost every grain growing section fire fighting organizations or fire preventive measures are being promoted.

State Superintendent of Weights and Measures Johnson announces that all fruit shippers who do not follow the regulations of the net container act will find that their fruits are subject to seizure.

The Maywood Packing Company will enlarge its present plant by building a 40 by 180 foot addition. The new plant will contain concrete vats for olive curing which will have capacity of 400 tons.

A big evaporation plant has been constructed on the Horst place near Wheatland, and carloads of vegetables have already been forwarded as war supplies. One hundred twenty-five people are employed.

The California Central Creamery at Ferndale is carrying an interesting "side line" in a potato evaporator. Thirty tons of dried potatoes are to be delivered by June 1. This will require the use of 210 tons of raw potatoes.

Napa County grape growers recently met at Napa and resolved: "We pledge ourselves by every honorable effort to aid the California Grape Protective Association in resisting the avowed attempt of the prohibitionists of the state to have the prohibition amendment ratified by the legislature.

The California Irrigation Association maintains that in the past 16 years the reclamation service has spent only \$870,000 in California. During the same period the sales of public lands have exceeded \$7,000,000. On the other hand the state of Nevada has secured from the service nearly \$6,000,000, and her public land sales aggregate only \$656,000.

Solano County farm bureau has adopted a wage scale; hay men \$2.50 per ten hour day; separator men, \$6.00; tractor drivers, \$5.50; sack sowers, \$4.50; sack tenders, header tenders, \$3.00; header drivers, \$3.50; header wagon drivers, \$3.00; header wagon loaders, \$3.50; harvester drivers, \$5.00. Prices include board. Fruit farm helpers: \$3.00 per ten hour day; laborers board themselves.

## Central California

Stanislaus is organizing more rural fire units.

Porterville recently shipped 18 cars of grapefruit.

Kings County Elberta peaches are commanding \$40.

Oakdale, Stanislaus County, recently shipped 20 carloads of beef cattle.

California Associated Raisin Company will build a large packing house at Selma.

Fresno County chamber of commerce is getting behind the Pine Flat irrigation project.

Stanislaus County food administrator contemplates seizing flour stored in that county.

The president of the California Bean Growers' Association is organizing Modesto bean growers.

Fruit growers of the Reedley district recently met and discussed ways and means of securing labor.

The Raisin Association and the Peach Growers will cooperate so far as possible in the using of packing plants.

The Fresno chamber of commerce will abandon its exhibition headquarters, this in the interest of economy during war.

Apple growers of the Pajaro Valley are thinning apples. The work has been interfered with because of shortage of labor.

Livingston, Merced County, is endeavoring to secure the establishment of a packing plant by the Associated Raisin Company.

The large number of grain field fires have convinced many that there is a definite campaign on to destroy as much food in this state as possible.

Tulare County Pomona grange has appeared before the board of supervisors and requested the abandonment of county advertising during war.

Parlier, Fresno County, is discussing matter of better housing for the large number of helpers who will be needed for harvesting and shipping operations.

Food Administrator Merritt is still wrestling with the proposition of fish for which the fishermen get 7½ cents and for which the consumer pays 12 to 20 cents.

Thirty thousand people attended the bi-county (Tulare-Kings) rally at Mooney Grove. The picnic covered two days and 5000 autos were counted at one time.

County Commissioner Rutherford of Stanislaus is recommending that where it is safe to do so grass should be burned to destroy vast numbers of hoppers now hatching.

Farmers near Kerman are being urged to join in the Pine Flat Dam project. "Therefore, be it resolved that the Kerman farm center heartily endorses the Pine Flat project."

California tomato growers have filed complaints with the food administration because of alleged attempt of packing corporations to violate food rules in the matter of new contracts.

The interest in cotton planting in the San Joaquin Valley has induced some to look up its history and it has been found that the plant has been grown successfully since Civil War times.

## Southern California

Lima beans are coming up.

Brawley's first full car of tomatoes was shipped May 21.

Pomona, Los Angeles County, reports light crop of walnuts.

Rialto honey producers are shipping honey direct to France.

Riverside County has a fully organized field fire fighting company.

Bloomington, San Bernardino County, is to have a citrus by-products factory.

Southern California planting of potatoes is much lighter than that of last year.

Chino and Oxnard beet producing sections report a shortage of about 30 per cent in acreage.

It is estimated that Pacific Coast fruit growers will have to face shortage of 10,000,000 boxes this fall.

Orange County estimates 10,000 more acres of beans than last year. The total will be not far from 55,000.

The effort to close Bear Valley to campers so as to prevent fishing in Big Bear Lake is causing a general protest.

The more observing walnut growers maintain that the coming year's output will not be above 50 per cent of normal.

Nuevo, Riverside County, potato growers have organized and will join with the San Bernardino marketing association.

Orange growers of Tustin, Orange County, are loading their shotguns for fruit thieves.

Apple growers of Chino, San Bernardino County, owning about 100 acres of apple orchards, will cooperate in marketing their fruit.

Report has been made that fertilizer bought through the Fruit Growers' Supply Company has excess amount of dirt and sand.

Assistant Farm Adviser Hodgson of Los Angeles has been giving citrus pruning demonstrations in various parts of Los Angeles County.

The Elsinore farmers employing members of the Women's Land Army express entire satisfaction in the quality of the work furnished.

The counties of Imperial, Los Angeles, Orange and San Diego will grow about 5000 acres of cabbage this year as compared with 3800 acres last year.

Ventura is building a series of model camps under supervision of the state immigration and housing commission. These are for the accommodation of apricot cutters.

Ventura live stock men recently met with Forester Homans and President Nares of the California Live Stock Men's Association and organized for the protection of the industry.

Governor Stephens, in addressing producers who are discussing the labor problem, said: "If necessary to enforce a work program, the legislature will be asked to provide ample power. There isn't room in California for the loafer."

The freight rate, heretofore charged on the basis of estimated weight and ordered to be changed on May 22 to actual weight of lemon and orange boxes, will continue as in the past until September 1. This according to recent ruling of the railway board.

## The Coast and General

Salt River Valley, Arizona, will produce 35 carloads of honey.

Chandler, Arizona, expects the early establishment of a new cotton gin.

Both America and Canada now have rulings that every able-bodied man shall either work or go to war.

The Hood River Apple Association has just distributed \$82,000. The association has distributed through the year \$609,000.

Yuma reports cotton as of slow growth, which is acceptable this year because of scarcity of labor to "chop" and give best care.

The Southern Pacific Railway is joining in the squirrel campaign both on lands along its right of way and alternate sections which it owns.

The war trade board has issued a ruling that imports of rubber shall be restricted to 100,000 tons instead of 150,000 tons received last year.

The Utah experiment station has just issued a circular on the alfalfa weevil and is endeavoring to control this pest and prevent its further spread.

Packages mailed to American prisoners in Germany may not exceed 11 pounds and only one such package per month is allowed under ruling of postal department.

Farmers near Toppenish, Washington, are mildly suggesting to the townspeople who clean up their yards of old rubbish and cans and dump along in the farmers' fence corners that they will return the compliment if the practice is not stopped.

The department of agriculture is taking up the pink boll worm campaign in earnest and has cleared 8974 acres of cotton land of every stalk of scattered cotton. The cost of clearing has been \$9.94 per acre. The idea is to eradicate every stalk of cotton in the infested section.

The federal government of Brazil will grant bounties in the form of agricultural machinery to farmers, companies and agricultural cooperative societies who will grow wheat during 1918. The premiums are more or less involved but, in a word, will approximate in value about \$3.00 per acre.

An organization has been formed in St. Louis which has for its aim the inspection of every farm where boys are to be sent to labor through the summer. It recommends as a step in guarding the health of the 250,000 boys who will work on the farms this summer a national "clean up and paint up" campaign.

America's stock of wheat is the lowest it has been since wheat was grown in this country. At the same moment Australia has 100 million bushels of surplus, with another 80,000,000 bushel increase from the new crop, while India's 70,000,000 bushel holdover has been increased by a new 50,000,000 surplus, and Argentina has another 150,000,000 bushels left over.

The food administration is insisting on conservation of wheat and other grains, not only on the home tables, but by all the threshing machines of the land. Investigation has shown that some conspicuously poor threshing has resulted in at least a ten per cent loss. More often the loss is not so great, but it is shown that in the average there is a loss of three bushels for every 100 threshed, and this is practically all preventable.

QUICK AND ECONOMICAL TRANSPORTATION

## Nash Trucks

### Haul Bigger Loads

Nash trucks, replacing teams, not only haul the farmers loads much faster but haul much bigger loads. They cut down the number of necessary trips to town in busy harvest time and greatly shorten the time required for each trip. In these days when the food production of the nation must be speeded up, this time saved to the farmer is a most important consideration. It enables the farmer to make every minute of his day count to full advantage.

Nash trucks are especially fitted to farm work because they are equipped with M. & S. automatic locking differentials. The driving wheels of Nash trucks cannot spin. They must always drive together. This saves tires and fuel. It lets Nash trucks get through where other trucks without this important feature cannot go.

Our transportation expert will be glad to tell you more in detail which Nash truck can serve you best.

## Constituents of Avocado

FROM an address on avocados as found in Guatemala Wilson Popenoe of the bureau of plant industry gives some interesting information regarding the constituents of the avocado. As to its analysis, and especially as to its content of oil, he says:

### Constituents of the Avocado

Thanks to the investigations of such men as Professor Jaffa of the University of California, we are gradually acquiring knowledge regarding the various constituents of the avocado and the proportions in which they occur. An interesting table published by Jaffa in Bulletin 254 of the agricultural experiment station at Berkeley shows that as a result of 28 analyses, including about 24 varieties, water was present in the pulp or edible portion of the fruit in percentages varying from approximately 60 to 80, with an average of 70. Protein was present in amounts varying from 1.30 per cent to 3.70 per cent, with an average of 2.08 per cent. The percentage of fat varied from about 10 to 30, with an average of 20.1. Carbohydrates were present in varying quantities, the lowest analysis showing 3.69 per cent and the highest 16.17

per cent while the average was 7.39 per cent. Finally, the amount of ash varied from 0.60 per cent to 1.93 per cent, with an average of 1.26 per cent.

As pointed out by Professor Jaffa in his explanation of these analyses, the total dry matter in the edible portion of the fruit is greater in the avocado than in any other fresh fruit, the nearest approach being in the case of the banana, which contains about 25 per cent. The protein content is also high for a fresh fruit, approaching closely that of some of the dried fruits in common use. In Professor Jaffa's own words, "so far as protein and ash in fresh fruits are concerned, the avocado stands at the head of the list, and, with reference to carbohydrates, contains on an average fully 50 per cent of that found in many other fresh fruits. These facts alone would warrant due consideration being given to the value of the avocado as a fresh fruit. The chief value of the avocado as food, however, is due to its high content of fat. This varies, as shown by the analyses, from a minimum of 9.8 per cent to a maximum of 29.1 per cent, with an average of 20.1 per cent."

## Nitrate

The work of transporting and distributing to farmers the nitrate purchased by the government for fertilizer use is proceeding as rapidly as possible, despite unavoidable transportation difficulties due to unexpected war demands for shipping.

It was originally contemplated that the 120,000 tons of 2000 pounds each of nitrate purchased under the provisions of the food control act would be delivered at Atlantic ports at the rate of something over 20,000 tons per month, beginning in January. At that time it appeared that deliveries could be timed in such a way that all applicants would receive, when needed, practically the full amount of their orders. Unfortunately, on account of unexpected war demands for shipping, it was impossible for the shipping board to assign vessels at the rate contemplated. In the circumstances it became necessary for the department to modify its plans of distribution.

The above is from statement issued by the United States department of agriculture and is a bit hopeful until it is understood that only shipments to southern Atlantic ports are being made. When the Pacific Coast will

receive shipments is not announced. To date 21,536 tons have been unloaded at Savannah, Charleston, and Wilmington, and of this amount, more than 17,000 tons have actually been shipped to farmers. On account of port conditions the railroads have not yet been able to move approximately 2822 tons for which shipping instructions have been given. The 2000 tons remaining on hand will be moved out in the very near future. Two ships carrying approximately 16,000 tons will be discharged this week at Mobile and Norfolk, and five additional ships, with a total tonnage of 26,500, are on their way to Chile for loading, and will discharge the greater part of their cargoes during May. A sixth ship of 7000 tons net weight has been tentatively assigned for carrying nitrate, making a total of approximately 72,000 tons which have actually been delivered in this country or for which transportation arrangements have been made. The department has assurance that the remainder of the 120,000 tons contracted for will come forward as speedily as possible. Unfortunately the Kentra, one of the ships assigned to move agricultural nitrate, was wrecked off the coast of Chile just prior to loading.

## Fruit Crop Estimate

FROM information gathered through county horticultural commissioners Chief Deputy Weldon of the state horticultural commission gives estimated percentages which will obtain in various counties with different fruits.

Almonds will be short crop as indicated by Mr. Weldon's figures. For instance, reports from the different counties show the following percentages: Alameda 55, Butte 40, Colusa 75, Contra Costa 60, Glenn 90, Lake 50, Los Angeles 73, Napa 70, Placer 75, Riverside 95, Sacramento 86, San Benito 100, San Joaquin 55, San Luis Obispo 99, Santa Clara 100, Solano 55, Stanislaus 82, Sutter 58, Yolo 60, Yuba 40.

Apples show far better. Los Angeles County estimates 100, San Diego 100, Santa Cruz withholds its estimate for the present, Sonoma 80.

Apricots: Alameda 65, Contra Costa 75, Fresno 75, Glenn 80, Kern 95, Kings 80, Los Angeles 60, Madera 55, Monterey 50, Merced 60, Napa 76, Orange 60, Riverside 75, Sacramento 80, San Benito 100, San Bernardino 84, San Diego 80, San Joaquin 50, Santa Clara 98, Santa Cruz 78, Solano 45, Sonoma 90, Stanislaus 78, Tehama 77, Tulare 90, Ventura 70, Yolo 70.

Cherries: Alameda 86, Butte 75, Contra Costa 80, Napa 95, Placer 80, Sacramento 90, San Bernardino 100, Santa Cruz 90, Solano 75, Sonoma 82,

Tehama 100, Yuba 90.

Figs: Practically every county reports 100 per cent. Only two counties report as low as 95 and those are not large fig producing counties.

Grapes show 100 per cent crop from practically every county reporting.

Grapefruit, in fact all citrus fruit, are reported as 100 per cent crops but it is yet early for estimating any of the citrus fruits.

Every county which reports on the olive crop reports full 100 per cent. Several counties, however, report insufficient information as yet.

Peaches: Butte 75, Contra Costa 70, El Dorado 100, Fresno 65, Kern 90, Kings 100, Los Angeles 100, Madera 75, Merced 80, Napa 75, Placer 75, Riverside 80, Sacramento 75, San Benito 100, San Bernardino 90, San Joaquin 60, San Luis 85, Santa Barbara 50, Santa Clara 100, Solano 80, Sonoma 75, Stanislaus 75, Sutter 95, Tehama 90, Tulare 80, Yolo 80, Yuba 100.

Pears: Alameda 60, Colusa 75, El Dorado 100, Lake 100, Los Angeles 100, Napa 60, Placer 110, Sacramento 100, San Benito 100, San Bernardino 100, San Diego 100, San Luis Obispo 90, Santa Clara 100, Shasta 100, Solano 50, Sonoma 90, Sutter 85, Yolo 100, Yuba 100.

Plums: Butte 100, Colusa 100, Contra Costa 60, Los Angeles 80, Madera 65, Marin 90, Napa 60, Placer 70, Sacramento 75, San Joaquin 75, Santa Clara 100, Shasta 75, Solano 75,

Prunes: Alameda 85, Butte 100, Colusa 100, Contra Costa 60, El Dorado 100, Kern 100, Kings 100, Lake 50, Madera 85, Monterey 75, Napa 60, Riverside 80, Sacramento 75, San Benito 100, San Diego 80, San Joaquin 75, Santa Clara 75, Shasta 90, Solano 50, Sonoma 75, Stanislaus 100, Sutter 90, Tehama 85, Tulare 75, Yolo 70, Yuba 80.

As to walnuts two large walnut producing counties, Ventura and Orange, report "insufficient information." Santa Barbara reports 70, other large producing centers report 100 per cent crop.

### CROP REPORT

J. S. Rhodes, Modesto, Stanislaus County

Apricots promise 75 per cent, almonds 80, apples 90, peaches, canning 75, drying 70, shipping 50, berries 90, cherries 95, figs 100, olives very heavy bloom, pears 90, plums 90, prunes 95, walnuts 90, oranges very heavy, grapes 100 all varieties.

Alfalfa condition good, cutting is in progress, barley 50 per cent, 1917 crop outside irrigation districts, full crop within districts, an average of about eight to ten sacks throughout the county; a large increase over last year's bean crop, 2500 acres all varieties now planting.

G. H. Flournoy, Horticultural Commissioner, Tehama County

Apricots 93 per cent, peaches 90, almonds 95, cherries 85, prunes 85.

### FUMIGATION OF CITRUS TREES

The investigations as to citrus tree fumigation have not been so general as they were a few years ago, but the department of agriculture continues to give some attention to this important feature of the citrus industry. Prof. R. S. Woglum is permanently located in Southern California and has now written another report, Farmers Bulletin 923. Copies may be had free by writing Division of Publications, U. S. Department of Agriculture, Washington, D. C.

This bulletin contains a general account of the approved methods of fumigating citrus trees with hydrocyanic acid gas to control scale insects and white flies. It deals with methods of procedure, necessary equipment, chemicals of fumigation, and effect of the gas on insects and plants, and includes dosage schedules to be employed for the control of the various common citrus plants.

### DESTROY BERRY CANES ATTACKED BY ORANGE RUST

Orange rust is one of the most common diseases of blackberries and raspberries. It appears early in the spring on the young leaves of the plant. Very early the young leaves appear somewhat folded and deformed and on the upper surface minute black bodies are produced. A little later as the leaves further expand the under surface is covered with an orange colored material. These areas soon break open and a mass of orange colored spores of the fungus are set free. The affected leaves are dwarfed and more or less curled. The rust is rarely found on canes. The diseased leaves gradually fall off and the disease seems to disappear during June and July. The affected plants are noticeably stunted but are rarely killed, according to George M. Reed of the University of Missouri college of agriculture.

The fungus which causes the orange rust lives from year to year in the tissues of the raspberry and blackberry. It continues to develop throughout the growing season. Affected plants are almost certain to show the characteristic symptoms of the disease on the leaves in early spring, which is the conspicuous stage of the rust. The affected plants rarely produce any fruit of value. The number of infected plants varies greatly. In some cases the disease is so serious as to practically ruin the crop.

The only known remedy for this disease is to dig up and destroy the affected plants as early as possible. Careful examination of the plants during May will clearly show the presence of the diseased plants. These should be promptly removed.

## PUMPS

Let Us Tell You All About  
**KIMBALL'S**  
Direct Flow Turbine  
Save Digging Pits and Large Wells

The Kimball Direct Flow Turbine is a moderate speed rotative pump employing an improved design of Impeller and Rectifier not embodied in any other pump. This, coupled with low velocity, reduces the friction to a minimum thus saving horsepower and reducing wear. All bearings are lubricated through a hollow shafting by a positive lubricating system. These bearings are protected by automatic water tight packing glands to prevent sand entering.

### Look at This!

A Kimball Direct Flow Turbine will pump:  
40 miners inches out of a 7 inch well.  
115 miners inches out of a 10 inch well.  
200 miners inches out of a 12 inch well.

Write us your irrigation requirements. NO CHARGE FOR ESTIMATES. Our many years of experience in irrigating systems places us in a position to help you save money if you will give us an opportunity.

## Farm for Profit

## and Help U. S. Win the War

Authoritative tests have proved that as high as 50 per cent increase in crop production may be expected from proper use of fertilizer. Do you realize what that increase means? Fertilizer is the basis of crop production, and compared to the prices of the crops they help to produce, fertilizers were never so cheap as they are today.

## MORE CROPS

will be raised in America this year than ever before. Make every acre you own or rent, produce to the limit. Fertilize your land—the increase in yield and price of crops will more than pay all the fertilizer expense—it will enable you to farm with profit. Don't spend your time working worn out land. Make it pay—Fertilize with Hauser's Organic Fertilizer.

## The Ohanez Grape

**W**E HAVE the following from the state board of viticultural commissioners:

The Ohanez variety of Almeria table grape is attracting widespread attention again in California, as the result of the free distribution by this board of some 20,000 cuttings of this variety of grape during the spring of the present year.

Over 1600 landowners in California made application for these cuttings and we were able to accommodate 1200 of them.

In our last bulletin we told of the possibilities of this grape and its wonderful keeping qualities, and we might add here that the Eastern handlers of table grapes are much interested in what California may do along the lines of cultivation of the Ohanez variety.

From an article by F. Richter written in French the board has had translated these items as to history and geographical area:

The Ohanez is a very ancient Spanish vine and the keeping quality of the grapes is excellent. Its culture in Spain has been very extensive during the last few years, particularly in the littoral of the Mediterranean, between Valencia and Malaga, but it is found a little everywhere in the Spanish Peninsula. The city of Almeria is the principal distributing point, as it is the center of fruit commerce, unique in the world by its importance inasmuch as they export annually more than 22,000 tons of grapes from the province of Almeria alone. It is surprising that a variety so valuable as the Ohanez, and which gives them so important a trade, is so little mentioned in ampelographic literature and that its origin remains so obscure.

"I wish, first of all, to make plain that the Ohanez is absolutely distinct from the Ragol, which certain authors

tend to confuse with this grape. The Ragol resembles the Ohanez very much at first sight, but it has neither the keeping qualities nor the delicacy of taste nor the fine appearance that distinguish the latter. It is generally agreed that the Ohanez comes from the region of Daria, in Ragol, and this is also stated by Simon Roxas Clement in his "Essay on the Varieties of the Vine Which Are Found in Andalusia." This assertion must be incorrect, for after the most searching inquiry that I have been able to make in the regions where the villages of Ohanez and Ragol are situated, and after the most careful reading of the records of these villages I have been able to establish that this variety was cultivated without doubt by the Moors, who have left some considerable vestige of the science of fruit culture. When they were expelled, the country remained uninhabited during a period of years; the ground remained uncultivated the full period of transition, and owing to these conditions, aided by the marvelous situation of the plain, amelioration was produced by the natural hybridization and the Ohanez as we know it today was the result.

"It was to such a situation as this that the farmers of Castile, who after taking possession of the country, restored the value to the ground and noticed this variety of grape stretching out its vigorous shoots in the trees. They quickly recognized the valuable quality of the fruit and saw again at Christmas time the superb clusters of grapes suspended from the vines in a state of perfect preservation. They multiplied the most fruitful stocks and thus made by this selection a well defined vine, to which the name of Ohanez was given and which seems to be the most justified."

## Destructive New Moth

The bureau of entomology of the United States department of agriculture is preparing to make an exhaustive survey of the Oriental peach moth, an insect of destructive feeding habits that is believed to have been introduced into this country during the past six or eight years in shipments of flowering cherries, peaches, etc., from Japan.

Fruit growers in many states will be asked to watch for the work of this moth, which attacks not only peaches and cherries, but apples, quinces, and some other fruits. The bureau will concentrate its inspection work in Virginia, Maryland, West

Virginia, Pennsylvania, Delaware, New York, New Jersey and Connecticut, in which states the insect is already present or its presence is suspected. Meanwhile "scouts" will be working north from Florida in the territory east of the Mississippi as the fruit ripening season advances. All the work will be in cooperation with state entomologists and other officials.

The survey is expected to enable the entomologists to make a more intelligent and specific attack on the insect. The undertaking is regarded as of particular importance at this time, because of the war time need to eradicate or control every form of insect attacking food supplies.

## Get the Codling Moth Before it Gets the Apple

A circular which should be of much interest to apple growers has just been issued by the Utah agricultural experiment station. In past years the experiment station has done considerable work on the codling moth, from which Professor Hagan, the author of this circular, has summarized the essential information for controlling the pest.

The first spray should be applied three to five days after the petals begin to fall, with the sole object of filling each calyx cup with the poison, for it is here that the worm which does the damage enters the apple. This should be followed ten days later by a second spraying. This will complete filling the calyx cups that are not open as early as the first spraying. The spray recommended by Professor Hagan is "arsenate of lead, about three pounds of paste or one and one-half pounds of powder to 50 gallons of water." Since the blossoms usually point outward, the spray should be driven down from the top, in from the side, and up from the bottom.

If the spraying has been done properly an examination somewhat later in the season should not show more than ten per cent wormy apples. If more than ten per cent are found wormy, a second spraying should be

applied about the first of August.

The trees should be banded about the first of July, which is about the time that the larvae begin coming down from the tree. The band provides a hiding place for the larvae, under which they crawl and remain. The bands should be removed about every eight days and the worms killed.

### OUR MONEY NOT WASTED

All of the money being expended for war purposes is not going to be a waste. Some of it is going to be shot away; some of it is going to be sunk at sea; some of it is going to be invested in machinery that will be useless in time of peace.

But a very great portion of it is being spent for things that will be as valuable when peace comes as now, though not so imperatively needed then—ships for instance. And as for the immense amount spent in adapting our manufacturing plants to war purposes, it is estimated that 90 per cent of our war machinery can and will be used for other manufacturing work after the war.

The invisible and intangible forces, the moral forces of the world, the soul and conscience of mankind, are fighting on our side.

# Pay For This Elevator By Saving Your Yearly Grain Sack And Extra Labor Expense

**R**IGHT now, when sacks are selling for two and three prices, is the time to rid yourself of this yearly expense item for all time to come. The saving you can effect in sacks, in time and in labor will soon pay for a

## JOHN DEERE TUBULAR STEEL ELEVATOR

Handling your grain in bulk, with this elevator, is not a temporary means of meeting the present shortage of sacks—it is permanent equipment that will continue to save you money for years to come.

### Ease of Operation — Low Operating Cost — Years of Satisfactory Service Absolutely Assured

It handles all small grains—wheat, oats, rye, barley, shelled corn, flax, rice. It has big capacity—it elevates 15 to 20 bushels per minute—handles the biggest load in from six to ten minutes time.

It serves you when marketing your grain, as well as when harvesting it—elevates from the wagon into tanks, granaries or cars—elevates from tanks or storage bins into wagons.

Operated by either engine or horses, its purchase ordinarily does not result in extra expense for power. A team of horses or a 2½ H.P. engine or larger will operate it.

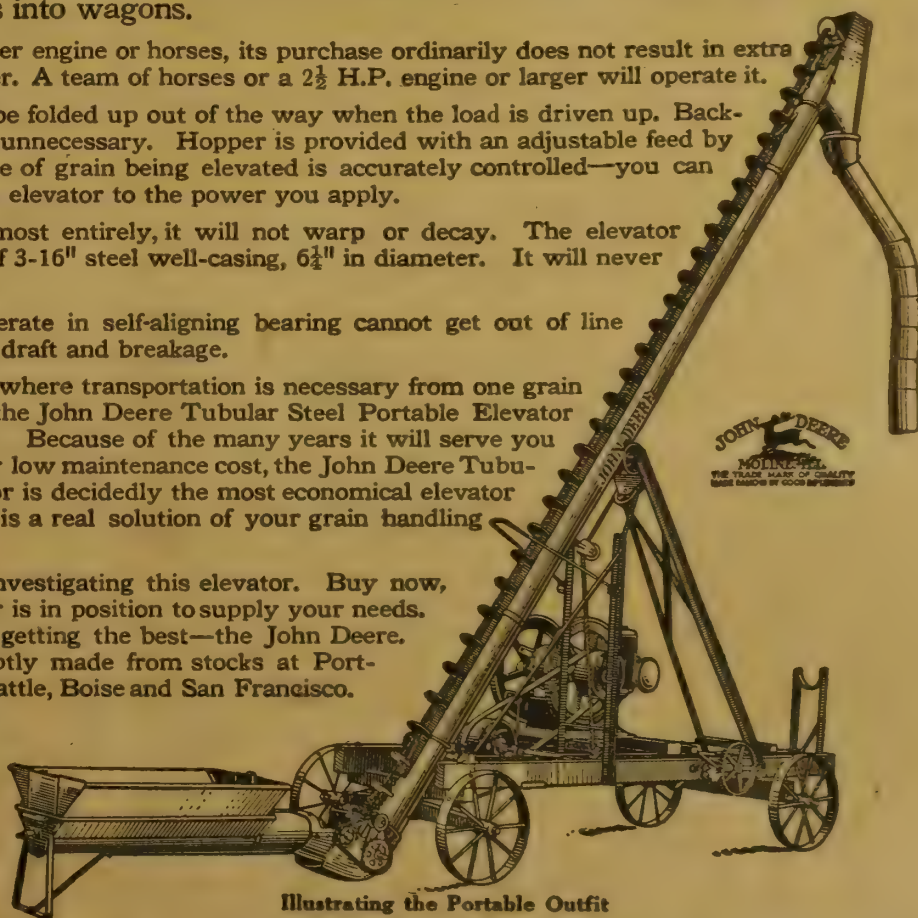

The hopper can be folded up out of the way when the load is driven up. Backing the wagon is unnecessary. Hopper is provided with an adjustable feed by which the volume of grain being elevated is accurately controlled—you can quickly adapt the elevator to the power you apply.

Built of steel almost entirely, it will not warp or decay. The elevator proper is made of 3-16" steel well-casing, 6¼" in diameter. It will never wear out.

Shafts which operate in self-aligning bearing cannot get out of line and cause heavy draft and breakage.

For big ranches, where transportation is necessary from one grain tank to another, the John Deere Tubular Steel Portable Elevator is recommended. Because of the many years it will serve you and its extremely low maintenance cost, the John Deere Tubular Pony Elevator is decidedly the most economical elevator to purchase. It is a real solution of your grain handling problem.

Don't postpone investigating this elevator. Buy now, while your dealer is in position to supply your needs. Save money by getting the best—the John Deere. Shipments promptly made from stocks at Portland, Spokane, Seattle, Boise and San Francisco.
